The appellant sought the benefit of the dates of his work on Exhibits G to G-5, inclusive, in his proof of conception and reduction to practice. We agree with the tribunals of the Patent Office that these exhibits do not satisfy the count of the interference, and that Exhibit G-6 is the first that embodies the issue here.

The distinctions between the Myers regulators G to G-5, inclusive, and the count of the issue, are well set out by the statement of the Board of Appeals, as follows:

> The type of device embodied in Myers' Exhibits G-G5 has two parallel arms, one of which is rigidly attached at its inner end to the gear sector and is pivotally connected at its outer end to the window supporting member and the other of which is a rack bar having teeth at each of its ends in engagement with pinions connected to the support on which the gear is mounted and to the horizontally movable window supporting member. Myers contends that as the arms are swung upwardly and downwardly by operating the gear sector the rack bar at each of its ends turns about the circumference of a pinion and since the latter is rigid with the support or the horizontally movable member as the case may be, there is pivotal connection between the rack bar and pinion. This contact between the rack bar and pinion is in the nature of a rolling contact, the point of turning constantly shifting about the circumference of the pinion instead of being an axis which is fixed with respect either to the pinion or the rack bar. We believe the language employed in the count is not fairly susceptible of such interpretation as to be readable on this type of device.

We agree with this statement.

Roethel, being the first to conceive and the first to reduce to practice, is entitled to priority.

The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE FRENCH

No. 3,788. Decided May 3, 1937

[89 F.(2d) 662]

REISSUE—INADVERTENCE, ACCIDENT OR MISTAKE.

Certain claims *Held* properly rejected in a reissue application on the ground that it had not been established that it was due to inadvertence, accident or mistake that claims not containing a certain limitation were not presented in the original application.

APPEAL from the Patent Office. Affirmed.

Mr. George A. Smith for French.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

Certain claims of appellant's application for a reissue of his patent No. 1,944,158, of January 23, 1934, relating to method of producing zinc oxide, having been allowed, appellant has appealed to this court from a decision of the Board of Appeals of the United States Patent Office, affirming the action of the Primary Examiner in refusing to allow claims 2, and 6 to 10, inclusive.

Claims 2 and 6 are illustrative of the claims on appeal and follow:

> 2. The method of producing zinc oxide from by-product zinc residues containing an alkali metal salt and a substantial amount of zinc carbonate, which includes boiling the residues with water to render the alkali metal salt content soluble, washing to dissolve and practically completely remove the alkali metal salt content, and then calcining the residue.
>
> 6. The method of producing zinc oxide from by-product zinc residues comprising metallic zinc, zinc carbonate, zinc sulphite, and an alkali metal salt, which includes suspending the residue in water, aerating to effect oxidation of metallic zinc, treating with water to dissolve the alkali metal salt, removing the alkali metal salt in solution, calcining the residue under oxidizing conditions to convert the zinc carbonate into zinc oxide and to oxidize zinc sulphite to zinc sulphate, washing out the zinc sulphate and grinding the zinc oxide.

The alleged invention relates to a process of producing a high grade pigment from zinc residues. The Examiner in his statement sets forth certain "Requisites of the Invention" as follows:

> To obtain "a high grade zinc oxide," the invention proposes: (1) to oxidize the metallic Zn content of the residue to ZnO; this is attained by suspending the by-product Zn residue in water, forming a *pulp* and aerating this pulp.
>
> (2) to "*render* the alkali metal salts • • • soluble" and remove these soluble salts, leaving a residue containing ZnO, $ZnSO_3$, and $ZnCO_3$; this is accomplished by boiling the water containing the suspended residue or pulp of (1), for 30 minutes or longer. The salt solution is then removed from the residue.
>
> (3) to calcine this residue in order to convert the $ZnCO_3$ to ZnO and the $ZnSO_3$ to $ZnSO_4$; this calcination is performed in the presence of air in order to assure formation of $ZnSO_4$.
>
> (4) to remove $ZnSO_4$ from the ZnO by washing with H_2O; and grinding and drying the ZnO product.

The Examiner in rejecting claims 2, 7, 8, and 10 held that they were incomplete because they did not embody all of the essential details necessary to produce the requisite result. The Examiner also rejected claims 6 to 10, inclusive, on the ground that there was no inadvertence, accident or mistake shown in failing to obtain such claims in the original patent.

As to the first ground of objection, the Examiner said:

> It is submitted that to obtain the desired high grade ZnO it is essential to satisfy *in combination* the requisites of (1), (2), and (3), specified above. As has been pointed out in the record of the parent application, the individual steps are devoid of novelty. • • •
>
> The general tenor of the disclosure and arguments of record in the parent application appear to concede that the invention resides in the combination of steps whereby a *high grade* ZnO will be produced as distinguished from the previously made low grade product. • • • • • • • • • • • •
>
> Claims 2, 7, 8, and 10 are accordingly incomplete and unpatentable, since they do not embody all of the essential details necessary to yield the *high grade* ZnO when by-product zinc residues of the type disclosed are treated, or since they combine steps individually involving no invention in a process which gives no improved result.

The Examiner points out in detail wherein the several claims lack the steps which he considers requisite.

As to this feature of the case, the Board said:

> Claims 2, 7, 8, and 10 have also been rejected as being incomplete because claims 2 and 7 omit step (3) and claims 2, 7, 8, and 10 omit step (1).
>
> Applicant argues that there may be such a small amount of metallic zinc and $ZnCO_3$ present that it is not necessary to oxidize them. There is nothing in the patent to indicate this and we believe that all of the steps are essential in order to obtain the high grade pigment desired, as distinguished from pigments obtained in prior art processes.

As to the second ground of rejection the Examiner stated:

> Claims 6 to 10 have been presented for the purpose of obviating this "undue limitation" [heating or boiling]. Failure to earlier present claims of the scope of 6 to 10 is attributed to "inadvertence, accident or mistake" on the part of the applicant, it being alleged that he failed to inform his attorneys "that the method in accordance with his invention might be practiced without heating or boiling the water used to treat the residues to remove alkali metal salt." (From oath.)
>
> A study of the specification of the *parent* application on the question of the removal of the alkali metal salts from the zinc residues leads to the conclusion that the disclosure is limited to the boiling treatment. The prior art found it necessary to calcine the residues "in order to render the alkali metal salt content soluble". The calcination also served to oxidize any metallic zinc particles present. (Parent application #504,421, page 1, lines 17–20.) Applicant teaches that he can effect the oxidation of metallic zinc in suspension in water by blowing with air, but the *rendering* of the alkali metal salt content soluble is effected by boiling (Appl. #504,421, page 1, line 29; page 2, lines 16–20). No other manner is suggested or can be inferred from the specification.
>
> It is submitted that the *reissue* application unwarrantedly alters the tenor of the original disclosure in the amendatory matter supplied to page 2, lines 24–27. This variation has the effect of minimizing the thought

of the original disclosure,—that the boiling step is a requisite,—to the *inference* that the boiling is optional; however page 1, lines 24–26 and page 2, lines 4–6 of the reissue still contain the definite indication that it is essential to *render* soluble the alkali metal salts of the by-product Zn residue. Furthermore the reissue oath is clearly inconsistent with the *original* disclosure in its indication that "boiling or heating is desirable but not essential". The tenor of the specification as originally presented clearly indicates that boiling is essential.

• • • • • • • • •

• • • the presence in amended original claim 1 [which was cancelled] of the expression now introduced into claims 7 to 10 indicates that the broad concept of rendering the alkali metal salts soluble was duly considered by applicant and deliberately cancelled. Under such conditions, there could have been no inadvertence, accident or mistake. • • •

In his brief appellant points out that

"through an error in making up the record, the claim designated '1' on page 37 of the record is misquoted."

The Solicitor for the Patent Office in his brief states:

It is noted that the record in this case does not include *original* claim 1 of application Serial No. 504,421 which is referred to by the Examiner and the decision of the Board of Appeals and which these tribunals said was cancelled after it had been amended.

The failure to include in the record the original claim 1 which was cancelled after amendment apparently must be taken as indicating that appellant does not wish to controvert any of the statements made by the Examiner or the Board of Appeals as to what subject-matter was included in the cancelled claim.

Since appellant has not seen fit to have incorporated into the instant record the said claim 1, we must assume that the tribunals below correctly found that the cancelled claim contained the elements which the tribunals said it did. Upon this state of the record, we must conclude that the Board's rejection of claims 7 to 10 upon the ground of no inadvertence was correct.

This leaves for consideration the rejection by the tribunals of claims 2 and 6. As before stated, claim 2 along with other claims was rejected upon the ground that it did not embody all the essential details necessary to produce the requisite results. These claims involve technical, scientific subject matter. There is a concurrence of views of the Patent Office tribunals on this subject and we are not convinced that the Board's decision is erroneous.

As to claim 6, it will be noted in the above quotation from the Examiner's statement that since the "boiling" limitation in the patent claims, which applicant seeks to obviate by reissue, was a requisite and important part of appellant's invention as disclosed in his parent application, his failure to present broader claims was not inadvertent. (The same holding also relates to claims 7 to 10, inclusive.) After considering appellant's parent application carefully we, like the tribunals below, can arrive at no other conclusion than that the failure to make broader claims in the parent application was not the result of inadvertence, and we are of the opinion that the rejection by the Examiner and by the Board of said claim 6 for the reasons stated by them was proper.

Appellant claims his alleged inadvertence occurred by reason of the fact that he failed to notify his patent attorney that the boiling step was unimportant and that the invention might be practiced without heating or boiling the water. From a statement by the Examiner it appears that this must have been stated in some oath not found in the record. It is not a question here of a limitation being in a claim only, but the parent application stated that:

When the metallic zinc content has been oxidized the suspended residue is heated to boiling and boiled for a period to render the alkali metal salts, as sodium carbonate, sodium sulphite, etc. soluble in water. Boiling may be continued for say up to thirty minutes or longer, if necessary.

We are in agreement with the conclusion reached by the Board of Appeals and its decision is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this decision.

ON REHEARING

Decided June 7, 1937

[90 F.(2d) 113]

BLAND, *J.:*

This case was argued in this court on March 10, 1937, and an opinion was handed down on May 3, 1937. On May 19, 1937, appellant filed a petition for rehearing and also filed with the clerk of the court a stipulation, not dated, between the counsel for appellant and the counsel for the Commissioner of Patents. Said stipulation is to the effect that amended claim 1 of appellant's original application for Patent No. 1,944,158, to which reference was made in appellant's original brief and in the decision of this court was the same claim as was printed in appellant's brief, which claim reads as follows:

1. The method of producing zinc oxide from by-product zinc residues containing an alkali metal salt and a substantial amount of zinc carbonate, which includes *treating the residue with water to dissolve the alkali metal salt content*, removing the alkali metal salt solution and then calcining the residue. [Italics ours.]

The stipulation recites that it is a reiteration of an oral stipulation to the same effect made at the hearing here on appeal. There being no written stipulation on file and the claim not appearing in the record, this court, without having in mind the oral stipulation, concluded that it must assume that the tribunals below correctly found that the cancelled claim contained the elements which the tribunals said it did and upon that assumption the court affirmed the decision of the tribunals without further reference to the claim.

There is a well-established practice in this court for obtaining from the Patent Office omitted subject matter necessary and proper to be in records upon appeal. In some instances written stipulations entered into between the parties and filed with the court have been regarded as sufficient to supply the needs. The situation now at bar illustrates the inadvisability of accepting oral stipulations between counsel. If a stipulation was to be entered into and filed subsequent to the oral stipulation it was the clear duty of counsel to see that it was promptly filed. The practice of suggesting or relying upon such oral stipulations as is here involved is not one to be commended.

However, under the particular circumstances of this case, we feel that appellant is entitled to a consideration of his reason of appeal upon which is based his contention that the tribunals of the Patent Office erroneously rejected some of appellant's appealed claims upon the ground of no inadvertence, accident or mistake necessary to support their allowance in a reissue application. We, therefore, grant appellant's petition for rehearing, but find it unnecessary to have argument or additional briefs.

The ground of rejection of the Examiner and the Board which involves a consideration of said cancelled, amended claim 1 is that since the appealed claims contain the limitation relating to *treating the residue with water to render the alkali metal salt soluble*, and since appellant in the prosecution of his original patent cancelled certain claims which included cancelled, amended claim 1, and which latter claim recited: "treating the residue with water to dissolve the alkali metal salt content" there was no inadvertence shown. Appellant by his reissue application seeks broader claims than those of his patent. In the appealed claims now under consideration the boiling and heating step which was in the patent claims is omitted and there is inserted instead thereof the said step of treating with water. Appellant was privileged to stand upon his rights in the original application and appeal, if necessary. He elected to cancel the claims. On the ground of inadvertence he cannot now claim the same invention, in a reissue application.

We think that cancelled, amended claim 1 is for the same invention as is defined by appealed claims 6 to 10, inclusive, and that under the circumstances there was no inadvertence shown by appellant such as is required by the statute and that the Board reached the right conclusion.

Since the other questions raised in appellant's appeal have been fully decided and discussed in the original opinion of May 3rd, and since our views as to them have not changed, we will not again repeat that discussion here. Nothing else in appellant's petition for rehearing nor in his original brief calls for further consideration by us here.

In view of our conclusion in the matter raised in the petition for rehearing with respect to said cancelled, amended claim 1, as well as on the other questions raised, we are of the opinion that the Board of Appeals, for the reasons stated in the decision appealed from, properly affirmed the decision of the Examiner rejecting appellant's appealed claims, and its decision is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

HULL *v.* DAVENPORT

No. 3,806. Decided May 29, 1937

[90 F.(2d) 103]

1. INTERFERENCE—PRIORITY—DILIGENCE.

A party to an interference who was the first to conceive the invention but the last to reduce it to practice does not have to establish, in order to prevail, that he was diligent from the time of his conception to his reduction to practice, but only from a time immediately prior to the entry of the other party into the field.

2. SAME—SAME—SAME.

"It is also well settled that the first conceiver cannot account for his failure to reduce his invention to practice for an unreasonable time after his conception by showing that he merely turned the matter over to his attorney if in fact the attorney in preparing the application and getting it into the Patent Office showed inexcusable lack of diligence."

3. SAME—SAME—SAME.

Where H., whose application was filed January 31, 1931, only established that he had submitted his disclosure to the attorneys for his employer on or about June 3, 1930 and that a large number of such records were submitted to these attorneys during that year and at the end of the year they had some 400 cases awaiting action by them *Held* that such evidence is insufficient to show that H. was exercising due diligence in constructively reducing the invention to practice from a time just prior to December 30, 1930, when D's. application was filed and priority was properly awarded to D.

APPEAL from the Patent Office. Affirmed.

Mr. Robert R. Candor for Hull.

Mr. Raymond G. Mullee for Davenport.

BLAND, *J.:*

This is an appeal by the party Hull from a decision of the Board of Appeals of the United States Patent Office, in which priority of invention relating to refrigerating apparatus was awarded to the party Davenport. The Board reversed the decision of the Examiner of Interferences which had awarded priority in the invention of the count to the junior party Hull.

Hull was the first to conceive and the last to reduce to practice. He was awarded a date of conception of June 3, 1930, and he filed his application January 31, 1931. The party Davenport filed his application December 30, 1930, and this date is his only date for conception and reduction to practice. Neither party actually reduced the invention to practice and both rely upon a constructive reduction to practice which consists of the filing of their respective applications.

The question of diligence of the party Hull was the only question considered by the Board and is the only question presented here.

Hull took testimony. Davenport took none. Such portions of the testimony as the parties regarded as of importance appear in the record by way of stipulation. Hull was employed in the Frigidaire department of the General Motors Corporation and the stipulated testimony shows that the patent department of this firm prepared and delivered to a certain law firm a great number of invention files and that each file included all necessary papers and sketches relating to a separate invention; that with respect to these files the records showed that during the year 1930 the lowest number of cases of this company in the hands of said attorneys was 311 at the first part of the year and that at the end of the year there were 406 inventions then awaiting action. The instant application contained two pages of drawings and eleven pages of printed specification which included six claims. On June 3, 1930, or within a week thereafter, Hull, through a patent contact man, delivered to the said

firm of attorneys the papers, sketches, etc., which were necessary for the preparation of the application for a patent on the invention here in controversy. There is nothing else shown in the record which throws any light as to what, if anything, was done with respect to the invention during the entire period of about eight months.

On the question of Hull's diligence, the Examiner of Interferences stated:

> The party Hull then has the burden of showing reasonable diligence from just before December 30, 1930, to January 31, 1931, when he filed his application. Since this involves a period of *only five weeks*, a period not in excess of a reasonable time in which to prepare an application taking into account press of immediate business and activity attendant upon the preparation itself, lack of reasonable diligence will not be imputed to Hull. [Italics ours.]

Upon appeal, the Board of Appeals, with reference to the subject of diligence, said in part:

> It is unnecessary to enter into a discussion of the subject matter involved as the only question requiring consideration is that of diligence. The party Hull has been awarded June 3, 1930, as a date of conception, at about the time his invention was placed in the hands of his attorney for preparing and filing an application. That application was filed January 31, 1931. The party Davenport filed December 30, 1930. The party Hull's explanation for the delay in filing over a period of *about eight months* is in effect that the attorneys were preparing many applications. [Italics ours.]
>
> It is our judgement that substantially eight months is entirely too long a period to be accepted as a reasonable time within which to file an application in the absence of a showing of special circumstances.

It will be noticed that the Examiner of Interferences took the position that "only five weeks" is the period of time in which appellant is required to show diligence, while the Board took the position that Hull's attorneys had delayed filing his application for a period of about eight months after the invention had been conceived and had offered no explanation of the cause of the delay.

Many cases have been cited and discussed. None of them is precisely in point. The facts with respect to diligence in each case differs from those of every other case and necessarily the question must always be decided in the light of the particular facts in the individual case.

In Patent Office practice the rule with respect to diligence is an old one and one which we think is well settled and generally understood by those familiar with patent law. In the Patent Act of 1836, 5 Stat. 117, provision was made for certain defenses to be set up in actions for patent infringement. Among the defenses which might be pleaded was

> "that he [the patentee] had surreptitiously or unjustly obtained the patent for that which was in fact invented or discovered by another, who *was using reasonable diligence* in adapting and perfecting the same." [Italics ours.] (Sec. 15).

This was, in substantially the same language, reenacted into the Patent Act of 1870, 16 Stat. 198, Sec. 61, which became section 4920 of the Revised Statutes. Soon after the passage of the act of 1836, the courts were called upon in infringement suits to determine who were the first inventors of the inventions there involved. We find in the decisions from that time to this day much discussion of the question, and while courts have used different language in stating the rule, there has been but little change in the rule as originally announced.

Clearly it was the intent of Congress to assure the first inventor who had completed the mental act of invention that he should not be deprived of his reward by reason of delays which he could not reasonably avoid in giving his invention to the public. But we must bear in mind that it was not alone to reward the inventor that the patent monopoly was granted. The public was to get its reward and have the advantage of the inventor's discovery as early as was reasonably possible. See Robinson on Patents, Sec. 385. It will be noticed that the act of 1836 which is the genesis of the rule of diligence as applied in Patent Office practice, said: "who was using reasonable diligence in adapting and perfecting the same." As applied by the Patent Office and the courts in most instances, the rule has finally crystallized to be that the first conceiver who is last to reduce to practice must couple his conception to his reduction to practice with reasonable diligence. In some cases it is stated that he must so act as to make his conception of the invention and the perfecting it a single inventive act. The weight of authority, however, regards his diligence sufficiently shown if it be found that he was diligent from a time just prior to the second conceiver's entrance into the field to the first conceiver's reduction to practice either actually or constructively. *Christie* v. *Seybold*, 55 Fed. 69; *Woods* v. *Poor*, 29 App. D. C. 397, 130 O. G. 1313; *Grundy* v. *Van Leir*, 22 C. C. P. A. (Patents) 1034, 75 F.(2d) 503, 457 O. G. 701; *Wilson et al.* v. *Sherts et al.*, 23 C. C. P. A. (Patents), 914, 81 F.(2d) 755, 467 O. G. 724.

[1] His lack of diligence from the time of conception to the time immediately preceding the conception date of the second conceiver is not regarded as of importance except as it may have a bearing upon his subsequent acts, for the reason that he has not forfeited his right to a patent by his delay when no adverse interests are involved, and it follows that his adversary should only be concerned with what happened immediately prior to and after his entry into the field. Evidence of diligence during the critical period may be shown either by affirmative acts or acceptable excuses or reasons for failure of action. See *Christensen* v. *Ellis*, 17 App. D. C. 498, 94 O. G. 2561.

[2] It is also well settled that the first conceiver cannot account for his failure to reduce his invention to practice for an unreasonable time after his conception by showing that he merely turned the matter over to his attorney if in fact the attorney in preparing the application and getting it into the Patent Office showed inexcusable lack of diligence. *Briggs* v. *Lillie et al.*, 1905 C. D. 168. Of course, in determining the diligence or the lack of diligence on the part of the attorney, considerations are involved unlike those in many respects which appertain to the inventor. Courts have been liberal in their holdings with respect to the length of time a busy patent attorney may take in the preparation and filing of patent applications. *Farmer et al.* v. *Schweyer*, 21 C. C. P. A. (Patents) 865, 68 F.(2d) 961, 444 O. G. 257. In one case, *Courson* v. *O'Connor et al.*, 227 Fed. 890, it was held that lack of diligence will not be imputed to the attorney unless the same amounts to negligence, but the weight of authority hardly goes this far. It requires that he must show reasonable diligence (see *Briggs* v. *Lillie et al.*, supra, and *Martus et al.* v. *Heise*, 17 C. C. P. A. (Patents) 1083, 39 F.(2d) 715, 400 O. G. 7) and that his lack of diligence must be charged against his client.

Now, measuring the facts at hand by the principles above announced, we, after most careful consideration, have arrived at the conclusion that the appellant here has not shown such reasonable diligence as the law requires and that the decision of the Board in denying the appellant priority of invention in the count at issue on account of his lack of diligence was not erroneous.

The Examiner of Interferences apparently took the position (although this is not the position taken by appellant's counsel in oral argument in this court) that all appellant had to do was to account for five weeks of time and that he had done so by showing that during that period of time the application was in the hands of the attorneys who prepared and filed the same. It is true that the critical period in the instant case in one sense is less than five weeks time, but the rule contemplates that there must be diligence at the time or just before the second conceiver enters the field and that from this time continuing diligence must be shown or lack of it satisfactorily explained. The burden was upon the appellant to affirmatively show reasonable diligence. The only act of diligence shown by appellant or his attorneys during the entire seven months period preceding the beginning of the alleged critical date was appellant's submission to his attorneys of his invention for the preparation of an application on June 3, 1930, or as the record shows, within a week thereafter.

[3] There is, therefore, no showing that appellant was diligently engaged in trying to perfect his invention at the time or just before the time when the appellee entered the field. We cannot presume under the facts in this case that appellant's attorneys were diligent at the time appellee entered the field nor are there any facts proven from which we may conclude that they were diligent at *any* particular time during the entire eight months period. Of course, they were using diligence when they were engaged in preparing the application, but when the preparation of it began has not been shown. It is not shown that the several hundred cases in the attorneys' hands were taken up in their regular order or that appellant's case was not put to one side and others preferred over it.

We are of the opinion, therefore, that it cannot be logically concluded that the appellant has shown such diligence as the law requires, and the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE MACLEAN AND NIESEMANN

No. 3,799. Decided May 29, 1937

[90 F.(2d) 108]

PATENTABILITY—VOLUMETRIC GAS METER.

Certain claims for a volumetric gas meter *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Messrs. Strauch & Hoffman, Mr. William A. Strauch, Mr. James A. Hoffman, Mr. Rex P. Mulligan, and *Mr. Lewis D. Konigsford* for MacLean and Niesemann.

BLAND, *J.*:

A number of claims in appellants' application for a patent relating to a pressure compensating gas meter were allowed by the Primary Examiner of the United States Patent Office. Claims 44, 46, and 60 were rejected for reasons to be hereinafter stated, and upon appeal to the Board of Appeals the Examiner's rejection of the involved claims was affirmed for substantially the same reasons as those given by the Examiner. Appellants have appealed here from the decision of the Board.

Claim 60 is illustrative of the three claims on appeal and follows:

> 60. A volumetric gas meter comprising an index, and means to drive said index to indicate the volume flow of gas through the meter; a second index; driving means for said second index including a frictional one-way clutch operatively connected to said first index and a cam mechanism; pressure responsive means connected for response to the supply pressure to said meter to control said cam mechanism to drive said second index through said clutch at a rate varied in accordance with variations in the supply pressure to correct the indication of said second index to a predetermined lower base pressure.

The alleged invention involved here is a gas meter which not only measures the volume of gas regardless of its pressure, but in addition, by proper cooperative means, mechanically computes the volume of gas measured by the meter in terms of cubic feet delivered at the specified base pressure. For this purpose appellants employ an uncorrected volume counter which operates from the positive displacement meter and indicates the volume of gas without correcting for its pressure, and a corrected volume counter which is driven from the uncorrected volume counter by driving mechanism in which the driving ratio changes in accordance with the pressure of the gas. Since gas is compressible, a much greater quantity of gas by weight passes through the meter when the line pressure is increased and it is important to industrial users who desire certain heating values to not only get a certain volume of gas but also a definite number of heating units. The well-known bellows type of gas meter which measured only volume had long been used. Certain other devices which attempted to take pressure into consideration in connection with the metering of gas were also used. It is shown that the use of the latter was unsatisfactory inasmuch as it was not possible to make the required compensatory computation with any degree of accuracy. It is stated by applicant that a 2 per centum tolerance in accuracy was acceptable but that until appellants' device was invented, no

meter would measure within that degree of accuracy.

During the prosecution of the application in the Patent Office many different references were cited, but as affects the claims involved here but two references are relied upon: Rudolph et al., 1,426,109, August 15, 1922; Diehl, 1,923,356, August 22, 1933.

Diehl, the main reference, is for a meter of the general type of appellants which accomplishes the same result as that of appellants in substantially the same way, that is to say, it will indicate a quantity as determined both by the volume of the gas and its pressure. Diehl's meter, as far as is of importance here, differs from applicants' device only in that in the driving mechanism of Diehl there is a pawl and ratchet connection of the usual type which permits motion of a measuring arm in only one direction.

Appellants have in their device substituted for said pawl and ratchet a frictional one-way ball clutch. Appellants thus describe this type of clutch in an amendment made to the specification during the prosecution of this application in the Patent Office:

> • • • Various forms of one-way clutches have been the subject matter of separate patents and are well known in the art, and the ball type clutch that is found in this case is specifically well known, one example being the well known "free-wheeling" devices on automobiles today, wherein rotation of a driving member in one direction forces the driven member to rotate therewith, whereas if the driving member is rotating in reverse direction, the balls do not engage their run-way and the parts slip.

It is conceded that the pawl and ratchet is intended to accomplish, and less efficiently does accomplish, the same purpose as appellants' frictional one-way ball clutch.

The Rudolph et al. reference was relied upon only to show that appellants' particular type of clutch was not new but was well known and its use was well understood by any mechanic who sought to make a connection of the character required here. Since it is conceded that this type of clutch is old, it will not be necessary to further discuss the details of the Rudolph et al. reference.

The three claims involved depend for their patentability upon the inclusion therein of language describing the frictional one-way ball clutch in combination with the other elements of the device. The claims at bar are much broader than the allowed claims, the allowed claims being drawn to cover specific structural limitations not found in the prior art.

The Examiner, in rejecting the claims, took the position that it did not involve invention to substitute the one-way ball clutch for the pawl and ratchet device of Diehl; that a mechanic skilled in the art would understand the inaccuracies which would arise, at least in part, from the pawl and ratchet device, and substitute a more suitable device which would eliminate or reduce the inaccuracies.

The Board of Appeals was of the same opinion. The gist of the Board's opinion is contained in the following language:

> We have given careful consideration to applicants' showing and contentions but are unable to agree that this situation presents a matter constituting invention. It is our opinion that it falls very clearly under the rule of law that the broad substitution of a- element of a combination by an equivalent known element where no new or unobvious result is produced does not constitute invention. While we can see and appreciate that the friction drive clutch in this relation prevents lost motion and consequently greater accuracy we still believe that if it was found that where such inaccuracy was such as to be material that it would be apparent to one skilled in the art to substitute some drive which is not inherently defective in this relation.

In this court, appellants argue at great length that part of their invention was to discover the cause of the inaccuracy of the old device. They call attention to the fact that the teeth or gear notches of the ratchet in the Diehl device necessarily would produce inaccuracies; that such a device cannot transmit a variable one-way motion without error whereas a one-way ball clutch transmits in one direction faithfully and accurately all motion imparted to it. Appellants argue that it is not practicable to lessen the size of the teeth of the ratchet in the Diehl device in order to lessen the degree of inaccuracy, since to do so would be to weaken the device and shorten its life.

It is conceded in this case that appellants have produced a compensating gas meter which is exceptionally accurate—much more accurate than any prior metering device of this character. Much of the improvement in accuracy is, evidently, largely due to the substitution of the one-way clutch for the pawl and ratchet device. It is argued by the Solicitor for the Patent Office that the improvement of appellants over the Diehl device is not a new result but is only a change in degree and not one of kind and that getting a better result by using the same device or equivalents does not necessarily imply invention. The Solicitor has cited as supporting authority for his contentions the cases of *Pickering et al.* v. *McCullough et al.*, 104 U. S. 310, 21 O. G. 73; *In re Cross*, 19 C. C. P. A. (Patents) 788, 53 F.(2d) 902, 416 O. G. 803; *Robbins* v. *Steinbart*, 19 C. C. P. A. (Patents) 1069, 57 F.(2d) 378, 421 O. G. 229; *In re Barsky*, 20 C. C. P. A. (Patents) 779, 62 F.(2d) 192, 428 O. G. 518; and *In re Williams*, 17 C. C. P. A. (Patents) 718, 36 F.(2d) 436, 392 O. G. 737.

While neither the "Examiner's Statement" nor the Board's decision definitely refers to the question of degree, the Examiner in rejecting one of the claims at bar originally stated that as far as the particular combination involved in the claim was concerned, the two clutches (Diehl's and the applicants') were equivalents and that the difference in the results of the two clutches was only a matter of degree.

Both the Examiner and the Board also commented upon the fact that when applicants filed their application they did not regard the frictional one-way ball clutch as of controlling importance. The claims as originally filed called for a "one-way ratchet mechanism" which was broad enough to cover the ratchet mechanism of Diehl.

We are of the opinion that the rejected claims do not define invention over the prior art cited, and that the Board properly affirmed the decision of the Examiner in rejecting the appealed claims. The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

GENERAL MILLS, INC., *v.* FREED

No. 3,754. Decided May 3, 1937

[89 F.(2d) 664]

TRADE-MARKS—GOODS OF SAME DESCRIPTIVE PROPERTIES. Dextrinized and gelatinized starches for retaining moisture in bakery products are not goods of the same descriptive properties as stock and poultry foods.

APPEAL from the Patent Office. Affirmed.

Messrs. Paul, Paul & Moore, Mr. A. C. Paul, Mr. Oscar W. Giese, and *Mr. Edmund H. Parry* for General Mills, Inc.

Mr. Myron B. Stevens for Freed.

HATFIELD, *J.:*

This is an appeal in a trade-mark opposition proceeding from the decision of the Commissioner of Patents affirming the decision of the Examiner of Interferences dismissing the notice of opposition of appellant and holding that appellee was entitled to the registration of the trade-mark "Sure-Dou", for use on "dextrinized and gelatinized starches for retaining moisture in all bakery products."

In his application appellee stated that he had used his trade-mark on his goods in interstate commerce since May 16, 1933.

In its notice of opposition appellant alleged that it is the owner of flour and cereal mills, and elevator properties located in various places throughout the United States; that it is the owner of the entire capital stock of various subsidiary corporations in the United States; that it is the owner of several trade-marks used on the products manufactured in its mills, and sold in interstate and foreign commerce by and through its subsidiary corporations; that, long prior to appellee's alleged date of adoption and use of his mark, appellant and its predecessor—Sperry Flour Company, now a subsidiary corporation—adopted and used a number of trade-marks on poultry and stock foods, each of which consists of the prefix "Sure" followed by suffixes suggestive of the goods to which the marks were applied; that each of those marks was registered in the United States Patent Office under the Trade-Mark Act of February 20, 1905—registration No. 217,026, issued August 24, 1926, on an application filed April 13, 1926, for the trade-mark "Surefat" for use on poultry food; registration No. 128,524, issued January 6, 1920, on an application filed June 16, 1919, for the trade-mark "Suregrow" for use on poultry food; registration No. 128,523, issued January 6, 1920, on an application filed June 16, 1919, for the trade-mark "Surelay" for use on poultry food; registration No. 181,550, issued March 25, 1924, on an application filed October 23, 1923, for the trade-mark "Surelive" for use on baby chick food; registration No. 128,522, issued January 6, 1920, on an application filed June 16, 1919, for the trade-mark "Suremilk" for use on stock food; registration No. 153,622, issued March 21, 1922, on an application filed May 25, 1921, for the trade-mark "Surepork" for use on stock food; registration No. 275,841, issued September 30, 1930, on an application filed May 31, 1930, for the trade-mark "Sureturk" for use on poultry food; registration No. 275,839, issued September 30, 1930, on an application filed May 31, 1930, for the trade-mark "Suregobble" for use on poultry food; registration No. 275,833, issued September 30, 1930, on an application filed May 31, 1930, for the trade-mark "Surepoult" for use on poultry food; registration No. 302,765, issued April 25, 1933, on an application filed December 19, 1932, for the trade-mark "Surecalf" for use on stock food; that appellant and the Sperry Flour Company have expended large sums of money in advertising appellant's trade-marks, and have built up an extensive business in interstate commerce; that the public associates appellant's marks with its goods; that the goods on which appellee uses his trade-mark are of the same descriptive properties as those on which appellant uses its trade-marks; that the trade-mark of appellee so closely resembles the several trade-marks of appellant that if used on his goods, confusion in trade would result, and the public would be deceived into believing that appellee's goods originated with appellant; and that appellant would be damaged by the registration of appellee's trade-mark.

Appellee filed a motion to dismiss the notice of opposition, alleging that the goods of the parties were not of the same descriptive properties, and that the marks were not confusingly similar.

The motion was denied by the Examiner of Interferences.

Thereupon, appellee filed an answer to the notice of opposition, and

> "particularly to the question of confusion in trade, which the opposer alleges, might arise in the event of registration of applicant's mark."

Appellee further alleged in his answer that the goods on which he used his trade-mark "Sure-Dou" were not goods of the same descriptive properties as the goods on which appellant used its trade-mark, to wit, poultry and stock foods; that appellee's dextrinized and gelatinized starches are used by bakers for retaining moisture in all bakery products; that, whereas appellant's goods are usually distributed through wholesale and retail grocers, feed stores, and the like, appellee's goods are sold directly to bakers, and not through wholesale and retail grocers, and other concerns handling products for human consumption; that those engaged in making bakery products would not believe that appellee's product originated with appellant; and that appellee's use of his mark on treated starches would not be likely to confuse purchasers as to the origin of appellant's products. In his answer, appellee cited and quoted from several decisions, all but one of which—*Chilton Printing Co.* v. *The Class Journal Co.*, C. D. 1912, 251, 182 O. G. 510—relate to the subject of "merchandise

of the same descriptive properties," as used in section 5 of the Trade-Mark Act of February 20, 1905, in support of his "contention that confusion in trade could not arise in the event of registration of his trade-mark." Appellee quoted the following from the headnotes in the Chilton case, supra:

"Where an opposer used neither the mark sought to be registered by the applicant nor one so similar thereto as to be liable to cause confusion in the mind of the public, he has no standing in the opposition proceedings, (citing *Underwood Typewriter Co.* v. *A. B. Dick Co.*, C. D. 1911, 298, 163 O. G. 730, 36 App. D. C. 175)."

On this record, the tribunals of the Patent Office held that appellee was entitled to the registration of his mark. In so holding, the Commissioner of Patents stated that, although appellee's mark "Sure-Dou" was "clearly *confusingly similar*" to appellant's mark "Suregrow", the goods of the respective parties did not possess the same descriptive properties, and, therefore, appellee was entitled to the registration of his mark. [Italics ours.] Accordingly, the notice of opposition was dismissed.

It is contended by counsel for appellant that appellee admitted in his answer that the products of the parties were derived from the same "raw material source," and that appellant's stock and poultry foods contain cereals and starch providing substances; that appellee also admitted that he was aware of the fact that appellant was engaged in the milling of flour which was sold to bakers; and that appellee failed to deny in his answer that his trade-mark so closely resembles the trade-marks of appellant "that the public will be confused and deceived into believing" that appellee's goods bearing his mark originated with appellant. It is further contended that the goods of the parties possess the same descriptive properties, and that the involved marks so closely resemble one another that the use by appellee of his mark on his goods concurrently with the use by appellant of its marks on its goods would be likely to cause confusion in the trade and result in injury to appellant.

It is conceded in the brief of counsel for appellee that appellee inadvertently failed to deny in his answer the allegation, contained in the notice of opposition, that his mark so closely resembled the marks of appellant as to cause confusion in the trade. It is argued by counsel, however, that the goods of the respective parties do not possess the same descriptive properties, and that confusion in trade will not result in the concurrent use by the parties of their respective marks on their goods.

At the outset, attention should be called to the fact that appellant, in paragraph 11 of its notice of opposition, declared that the goods of the respective parties possess the same descriptive properties, and that, in paragraph 12, it was alleged that the marks of the parties so closely resemble one another that, if used by them on their respective goods, "the public will be confused and deceived into believing" that appellee's goods originated with appellant.

We think it was the purpose of appellant to allege that the goods of the parties possess the same descriptive properties, and that, therefore, confusion in trade will result because of the similarity of the marks of the parties.

(It is clear from the provisions of section 5 of the Trade-Mark Act of February 20, 1905, that if the marks closely resemble one another, or even if they are identical, confusion in trade will not be likely to result in a statutory sense, unless the goods of the parties possess the same descriptive properties.)

We think appellee's answer is sufficient to raise the question of the confusing similarity of the involved marks when used on the goods of the respective parties which, appellee alleged, did not possess the same descriptive properties.

Although the notice of opposition contains an allegation that appellant's marks are used on, or in connection with, flour and other cereal products of appellant, there is no statement therein as to when such marks were so used. (It will be noted that the registrations hereinbefore set forth, relate only to stock and poultry foods.)

Although appellee conceded in his answer that the goods of the respective parties were derived from the same raw material source, he qualified that concession by stating that appellant's stock and poultry foods, although containing cereals and starch, usually contain "other products that are supposed to be beneficial to the health and growth of live stock and poultry."

We are in agreement with the contention of counsel for appellant that appellee's trade-mark "Sure-Dou" closely resembles at least one of appellant's trade-marks—"Suregrow". However, we are not in accord with their contention that the goods of the respective parties possess the same descriptive properties.

Appellee's "dextrinized and gelatinized starches," used by bakers for the purpose of retaining moisture in bakery products, are sold directly to the consumers—bakers, and not to wholesale or retail grocers; whereas, it is alleged in appellee's answer and not denied by appellant that appellant's goods are "usually distributed through wholesale and retail grocers, feed stores and the like."

It is true that appellant refers in its notice of opposition to its products as cereal products. However, there is nothing in the notice of opposition from which it may properly be deduced that other materials are not used in its poultry and stock foods, as alleged in appellee's answer.

We find nothing of record which tends to establish that the use by appellee of his mark on his goods, concurrently with the use by appellant of its marks on its goods, would be likely to cause confusion or mistake in the mind of those who purchase the goods of the respective parties.

Considering the differences in their description, character, and use, and the people to whom they are sold, we are of opinion that the goods of the respective parties do not possess the same descriptive properties.

Although appellee's mark "Sure-Dou" closely resembles appellant's mark "Suregrow", we are not in accord with the holding of the Commissioner of Patents that those marks are "confusingly similar," in view of the fact that the goods of the parties do not possess the same descriptive properties.

For the reasons stated, the decision of the Commissioner of Patents is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

DUERR & BROYLES *v.* POTTS

No. 3,710, Decided May 29, 1937

[90 F.(2d) 117]

INTERFERENCE—PRIORITY—RULES 109 AND 130.

Where D. & B. made no opposition to the inclusion in the issue of certain proposed counts, they may not, in view of the provisions of rules 109 and 130 of the Rules of Practice of the Patent Office, on an appeal from an award of priority to P. as to such counts, be heard to argue that P. cannot make them.

APPEAL from the Patent Office. Affirmed.

Mr. Eugene C. Brown for Duerr & Broyles.

Mr. J. W. Schmied for Potts.

HATFIELD, *J.:*

This is an appeal in an interference proceeding from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Examiner of Interferences awarding priority of the invention defined by appealed counts 5, 6, and 7, to appellee.

The interference is between appellants' Patent No. 1,880,906, issued October 4, 1932, on an application filed July 9, 1931, and appellee's application, Serial No. 529,268, filed April 10, 1931, for reissue of Patent No. 1,708,954, issued April 16, 1929, on an application filed September 17, 1925.

Count 5 is illustrative of the appealed counts. It reads:

Count 5. In a telegraph system, a multiplex system terminating at a main station, a simplex system also terminating at said main station, means for transmitting corresponding marking and spacing conditions over said simplex system when marking and spacing conditions are received over said multiplex system, and means for applying marking conditions only to the simplex system when spacing conditions only are received over the multiplex system.

It appears from the record that an interference was declared on April 13, 1933, involving four counts, 1 to 4, inclusive; that the counts originated in appellants' patent; and that, on July 25, 1933, counsel for appellants moved to dissolve the interference as to counts 1 and 2 on the ground that appellee could not make them.

On July 26, 1933, appellee filed a motion to add to the interference claims in appellants' application corresponding to counts 5, 6, and 7, here involved. On August 18, 1933, appellee filed a supplemental motion to add such counts, and stated therein how, in his opinion, the involved counts read on his disclosure.

Appellants' motion to dissolve the interference as to counts 1 and 2, and appellee's motion to add thereto counts 5, 6, and 7 were set for hearing on November 6, 1933.

On March 17, 1934, the Examiner of Interferences denied appellants' motion to dissolve as to counts 1 and 2, and granted appellee's motion to amend the interference by adding counts 5, 6, and 7.

In granting appellee's motion to amend, the Examiner said:

Each of the proposed counts A, B, and C is found to read on the Potts disclosure as applied thereto by the moving party. As no brief has been filed in opposition to this motion, it is deemed necessary [unnecessary] to discuss it in detail.

On June 12, 1934, the interference was reformed by the addition of the involved counts—5, 6, and 7.

As the date alleged in appellants' second preliminary statement for conception of the invention defined by the involved counts was subsequent to the filing date of appellee, appellants, on August 7, 1934, were ordered to show cause, on or before September 7, 1934, why judgment on the record should not be entered against them as to counts 5, 6, and 7, a similar order having been previously entered as to counts 1, 2, 3, and 4.

In response to the order to show cause, appellants, on September 7, 1934, filed a motion to dissolve the interference as to all of the counts in issue—1 to 7, inclusive. As to the counts here involved—5, 6, and 7, appellants set forth the decision of the Primary Examiner holding that appellee could not make them, and argued that the decision of the Primary Examiner was correct. The motion also contains an argument as to why the interference should be dissolved as to all of the counts in issue, because of the inoperativeness of appellee's device.

On September 13, 1934, appellants' motion to dissolve was dismissed. In his decision, the Examiner of Interferences stated:

Counts 5, 6, and 7 were added to the issue by motions under rule 109. According to paragraph 2 of said rule, motions to dissolve with regard to added claims will not be considered where questions raised could have been disposed of in connection with the admission of the claims. Obviously any proper question sought to be raised by Duerr & Broyles' motion to dissolve filed September 7, 1934, could have been disposed of in connection with the admission of the claims as the result of Potts' motions to add counts.

Thereupon, the Examiner of Interferences awarded priority of invention to appellee as to all the counts then in issue—1 to 7, inclusive.

On September 14, 1934, counsel for appellants filed a motion requesting that the decision of the Examiner of Interferences be set aside, and a rehearing granted.

The motion to reopen was set for hearing on October 3, 1934, and a hearing having been had, was denied by the Examiner of Interferences on October 8, 1934.

Thereafter, appellants requested reconsideration of their motion to reopen, and consideration of their motion to dissolve. That request was denied by the Examiner of Interferences on November 2, 1934. Thereupon, on November 3, 1934, an appeal was taken to the Board of Appeals, and, on the same day, appellants petitioned the Commissioner of Patents to exercise his supervisory authority and restore jurisdiction to the Examiner of Interferences for the purpose of permitting them to take testi-

mony relative to the alleged inoperativeness of appellee's device.

On December 14, 1934, the Commissioner denied appellant's petition.

On March 12, 1935, a little over four months after appellants had taken the appeal to the Board of Appeals, they filed notice of a statutory bar.

In its decision, the Board, citing rule 130 of the Rules of Practice in the United States Patent Office, refused to consider the allegations contained in the notice of a statutory bar, because the notice was filed too late and concerned a matter which had not theretofore been considered in the record. The Board held that appellee was not entitled to make counts 1 and 2, then in issue, and stated that the motion to dissolve as to those counts should have been granted. With reference to counts 5, 6, and 7, the Board said:

> Previously and within the proper motion period, Potts had moved to add proposed claims A, B, and C as counts 5, 6, and 7. This motion had been granted at the time the above motion of Duerr et al. as to counts 1 and 2 had been denied. Duerr et al. did not oppose the new counts at the time they were proposed but after the Examiner had issued an additional order to show cause in respect to these new counts, Duerr et al. presented a motion to dissolve with respect to them—paper 21. It was held by the Examiner of Interferences that such questions should have been disposed of in connection with the arguments on motions to amend with respect to these proposed counts 5, 6, and 7. The Duerr et al. motion in respect to counts 5, 6, and 7 was accordingly not set for hearing and was dismissed by the Examiner of Interferences—paper 22. It appears therefore that under the practice of rule 130, any contentions as to counts 5, 6, and 7 are not properly before us for consideration since this matter was never presented by timely motion or treated on its merits or decision rendered with respect thereto by the Examiner of Interferences.
>
> • • • • • • •
>
> It is noted that count 7 contains a limitation in respect to this different rate of storing and repeating. It is recommended that this claim be considered on *ex parte* treatment of the Potts application by the Primary Examiner in accordance with our decision unless our conclusions in this respect are modified on appeal.

Thereupon, the Board reversed the Examiner of Interferences as to counts 1 and 2, and held that appellee was not entitled to make them, but affirmed the Examiner as to counts 3 to 7, inclusive, and awarded priority to appellee as to those counts.

Appellee did not file an appeal to this court from the decision of the Board of Appeals holding that he could not make counts 1 and 2.

Appellants appealed from the Board's decision as to counts 5, 6, and 7 only.

Rule 109 of the Rules of Practice in the United States Patent Office provides that

> "New preliminary statements will be received as to the added claims, but motions for dissolution with regard thereto will not be considered where the questions raised could have been disposed of in connection with the admission of the claims."

Rule 130, supra, referred to by the Board of Appeals, so far as pertinent to the issues here, reads:

> 130. Where the patentability of a claim to an opponent is material to the right of a party to a patent, said party may urge the non-patentability of the claim to his opponent as a basis for the decision upon priority of invention. A party shall not be entitled to raise this question, however, unless he has duly presented and prosecuted a motion under rule 122 for dissolution upon this ground or shows good reason why such a motion was not presented and prosecuted. When the Primary Examiner has denied such a motion for dissolution the question shall not be reinvestigated by the Examiner of Interferences except in view of evidence which was not before the Primary Examiner when the motion was considered, but it may be raised before the appellate tribunals on appeal from the award of priority.

It will thus be seen that, under rule 109, supra, the Examiner of Interferences refused to again consider the right of appellee to make counts 5, 6, and 7, because no opposition to the addition of them to the interference was made by appellants at the hearing on appellee's motion to add claims corresponding thereto.

It will further be noted, as stated by the Board in its decision, that appellants

> "did not oppose the new counts at the time they were proposed but after the Examiner had issued an additional order to show cause in respect to these new counts, Duerr et al. presented a motion to dissolve with respect to them—paper 21."

The Board, therefore, refused to consider appellee's right to make counts 5, 6, and 7, because of the provisions of rule 130, supra, that

> "A party shall not be entitled to raise this question [the right of a party to make claims constituting the counts in issue], however, unless he has duly presented and prosecuted a motion under rule 122 for dissolution upon this ground or shows good reason why such a motion was not presented and prosecuted."

It seems to be clear from the quoted provisions of rule 130, supra, that as appellants failed to raise objections, either orally or in writing, at the hearing on appellee's motion to add claims corresponding to counts 5, 6, and 7, they are not

> "entitled to raise the question of the right of appellee to make those counts under rule 130, supra, because they have not 'duly presented and prosecuted a motion under rule 122 for dissolution upon' the ground that appellee could not make claims corresponding to counts 5, 6, and 7, nor have they shown a good reason why such a motion was not presented and prosecuted."

Counsel for appellants concedes that he made no written objection at the hearing on appellee's motion to make claims corresponding to counts 5, 6, and 7. He argues, however, that he orally opposed it.

Counsel for appellee contends that counsel for appellants did not orally oppose the addition of those counts to the interference.

We do not, of course, question the veracity of counsel for either of the parties. However, we have been unable to find anything of record to indicate that counsel for appellants, either orally or otherwise, opposed the addition of claims corresponding to counts 5, 6, and 7 at the hearing before the Examiner of Interferences.

It would seem to be clear from the decision of the Examiner of Interferences of September 13, 1934, that he was of opinion that counsel for appellants did not raise any objection to the addition of counts 5, 6, and 7 to the interference, and, therefore, he refused to reconsider his original decision holding that appellee was entitled to make those counts.

That the Board of Appeals was of the same opinion, is clear from its decision.

In view of the fact that the Board of Appeals held that appellee's right to make claims corresponding to counts 5, 6, and 7 was not an issue which it had any right to consider, for the reasons stated in its decision, in which we concur, and as the Board did not consider that issue, it will not be considered by this court. *In re Otto Schmidt and Johannes Ufer*, 18 C. C. P. A. (Patents) 827, 45 F.(2d) 916, 407 O. G. 3, and cases cited; *Herthel and Tifft* v. *Dubbs*, 20 C. C. P. A. (Patents) 1128, 65 F.(2d) 138, 437 O. G. 3; *Angel* v. *Morin*, 21 C. C. P. A. (Patents) 1018, 69 F.(2d) 646, 446 O. G. 720; *Josleyn* v. *Hulse*, C. D. 1908, 34.

No other issue having been raised in the amended notice of appeal to this court, the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE SIBLEY

No. 3,789. Decided April 5, 1937

[88 F.(2d) 960]

1. PATENTABILITY—TEACHINGS OF PRIOR ART.
   Where it was established that at least twenty-two reaction products which are satisfactory as anti-oxidants in the vulcanization of rubber are useless as an anti-oxidant in the production of applicant's coating composition, "it is going somewhat too far to hold that the teachings relative to the rubber vulcanization art and the soap art, even when coupled with the somewhat fugitive expressions of different of the references as to the similarity of reaction of some similar agents in the paint and varnish art, precludes the idea of invention on the part of appellant."
2. SAME—COATING COMPOSITION AND PROCESS OF PREPARING.
   Claims for a coating composition and process of preparing *Held* patentable over the prior art.

APPEAL from the Patent Office. Reversed.

BLAND, *J.*, dissenting.

Messrs. Williams, Rich & Morse, *Mr. Henry D. Williams*, *Mr. Giles S. Rich*, and *Mr. Albert H. Kirchner* for Sibley.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GARRETT, *J.*:

Appellant brings to us for review a decision of the Board of Appeals of the United States Patent Office affirming the decision of an Examiner denying the patentability of all claims, numbered 1 to 20, inclusive, of an application for patent on "Coating Composition and Process of Preparing Same."

Claims 1, 7, and 20 are selected as illustrative of the subject matter. They read:

> 1. A coating composition containing a drying oil having incorporated therein a positive oxidation catalyst and a controller of oxidation thereof comprising a reaction product of a ketone and an amine or a derivative thereof.
>
> 7. A coating composition containing a drying oil having incorporated therein an inhibitor of oxidation thereof comprising a reaction product of diacetone alcohol and aniline.
>
> 20. The improvement in the manufacture of coating compositions which comprises mixing the composition containing a drying oil with a positive oxidation catalyst and a controller of oxidation thereof comprising a reaction product of an aliphatic ketone and an aromatic primary amine free from secondary amino substituents.

Ten of the twenty claims on appeal are for the composition of matter and ten for the process of manufacture. All of the claims except 7, 14, 15, and 16 specify a positive oxidation catalyst and those include a drying oil which it seems acts in substantially the same manner as a positive oxidation catalyst. All the claims specify a controller of oxidation (or what is conceded to be an equivalent thereof), defined as an inhibitor of oxidation and this element constitutes the crucial limitation involved in the controversy. The brief for appellant states:

> The controller of oxidation of claim 1 is a reaction product of (1) a ketone and (2) an amine or a derivative thereof. This is a class of substances never before used for the purposes of the invention as claimed, and the specification names 17 substances of the class of ketones, any one of which may be combined with any one of 15 other substances of the class of amines to produce the reaction product desired. The ketone in another claim is defined as an aliphatic ketone, and the amine in another claim is defined as an aromatic amine, and specifically the ketone is set forth as diacetone alcohol and the aromatic primary amine as aniline.

The Examiner said:

> In the application appealed by the applicant, there are six claims to wit, 1, 2, 3, 8, 9, and 10, broad as to the amine; they are not restricted to the primary amine. As to the other claims they are more restricted, embracing only the primary amines. • • •

In its decision the Board eliminated one British patent which has been cited as a reference by the Examiner. So, the case comes to us with the following patents and publications cited as prior art:

Ostwald et al. (British), 10,361, April 20, 1911; Powell, 1,672,657, June 5, 1928; ter Horst, 1,807,355, May 26, 1931; ter Horst, 1,822,548, September 8, 1931; Merkle, 1,829,999, November 3, 1931; Yohe, 1,909,329, May 16, 1933; Soc. Chem. Ind. Japan, vol. 39 (1930), pp. 129–30; J. Ind. & Eng. Chem., pp. 691–93.

The following general statement as to the grounds of rejection is quoted from the brief of the Solicitor for the Patent Office:

> It was held that the patent to Merkle discloses a composition of the general type claimed by appellant, which includes a drying oil, an oxidation catalyst, and then an anti-oxidant. It was admitted by the Patent Office tribunals that the specific reaction product employed by appellant as an anti-oxidant was not mentioned in the Merkle patent. However, the specific material employed by appellant as an anti-oxidant in the combination as claimed has herebefore been used to prevent undesired oxidation in rubber. On this state of the art the tribunals of the Patent Office ruled that the subject-matter of the appealed claims was without patentable merit over the prior art. • • •

The brief on behalf of appellant says:

> The case at bar presents a simple question. Given the use of substances in another art, which substances are substantially the same as applicant's substances, but it being conceded that so far as this particular art is concerned the use of applicant's substances as claimed is new, did it involve invention to discover that these old substances possess new properties not theretofore known?

Of the patents cited as references both of those to ter Horst are entitled "Treatment of Rubber." They were relied upon to show the specific anti-oxidant in rubber, it being the theory, as expressed by the Examiner,

> "that the regulating and control of oxidation in rubber is the same as in oil, soaps and coating compositions containing drying oils."

The patent to Merkle is entitled "Coating Composition and Process of Preparing Same" and states that it more particularly applies to drying oil coating compositions and methods of preventing premature oxidation of the compositions. It discloses a pro-oxidant and an anti-oxidant, but concededly his anti-oxidant is different from that of appellant. Merkle recites a number of anti-oxidants but does not name that of appellant. So, it appears that the Merkle patent was primarily cited to show that the general combination described in the claims at issue is old, and the patent to Ostwald et al. to show a solution of the problem with another anti-oxidant "many years prior" to Merkle, but the Ostwald et al. anti-oxidant is also conceded to be different from that of appellant. Ostwald teaches that

> "Lacquers, drying oils, and similar substances and products therefrom, such as linoleum and the like behave in a similar manner as india-rubber products. They

change under the influence of light and air; for instance linoleum and oil cloth break; colours, varnishes and lacquers crack and peel off; oil and spirit varnishes shrink and also peel off. This takes place particularly with products containing certain hard resins, for instance shellac and sandarac."

The Board says of the Ostwald et al. reference:

The British patent to Ostwald et al. also lists, as amenable to the same general treatment, rubber, along with drying oils, resins and varnishes. There are a number of statements in this patent which lead one to the conclusion that substances which might be useful for controlling oxidation of one of the materials mentioned might also be useful with the others. Ostwald et al. do not mention a great number of suitable materials.

Of the Yohe patent, which relates to rubber treatment and is entitled "Age Resister," the Board says:

The patent to Yohe discloses the direct reaction of ketonic bodies with amines and is pertinent to the substitution of amines, rather than their salts, in the materials employed by ter Horst.

The patent to Powell is entitled "Soap Stabilization." The Examiner states, in substance, that it and the publication, "Soc. Chem. Ind. Japan," are cumulative as to the analogy of the problem of preventing and also controlling oxidation in oils (or oil material as soap) and rubber. Further allusion to this article will be made by us later in this opinion.

The purpose of the "J. Ind. & Eng. Chem." citation is shown by the following excerpt from the decision of the Board:

The Smith article in Industrial and Engineering Chemistry, which article deals with inhibiting agents generally useful with unsaturated organic compounds, makes reference to the fact that substances having an ethenoid linkage are subject to oxidation and that this oxidation can be controlled by the use of a suitable anti-oxidant. In discussing the general subject, specific reference is made to oil, fats, fatty acids, soaps, acrolein, rubber and petroleum. The article goes on to discuss a number of specific inhibitors and makes the statement that it is logical to assume that the substances which inhibit in one case should do likewise in another.

[1] Appellant, by affidavits, to which no reference was made in the decisions of the respective tribunals below, seems to have established (partly by his own researches and partly through experiments made by researchers for the American Paint and Varnish Manufacturers Association at his instigation) that at least twenty-two reaction products, composed of combinations of different chemicals, found to be satisfactory and efficient as anti-oxidants in the vulcanization of rubber, are useless as anti-oxidants in the production of appellant's product. No question is made as to the verity or accuracy of this evidence, and we are impressed with the argument that where so many agents taught to be good as anti-oxidants, often referred to in the record as anti-agers, for rubber are useless for appellant's purposes, it is going somewhat too far to hold that the teachings relative to the rubber vulcanization art and the soap art, even when coupled with the somewhat fugitive expressions of different of the references as to the similarity of reaction of some similar agents in the paint and varnish art, precludes the idea of invention on the part of appellant.

It is our view that the most potent reference cited is the article from the Journal of the Society of Chemical Industry of Japan, listed supra, as "Soc. Chem. Ind. Japan, vol. 39 (1930) pp. 129–30." Except for one example by the Ostwald et al. patent teaching the mixing of thickened linseed oil and aniline (said to be a well known accelerator of rubber vulcanization) for the making of linoleum, the Japanese article seems to be the only reference which definitely teaches the treatment of drying oil and rubber stock with the same materials. The article (published in 1930) after saying that "The antioxidants extended recently their use in rubber industry," recites that its authors, Yoshio Tanaka and Mitsuo Nakamura, seemingly of the Department of Applied Chemistry, Faculty of Engineering, Tokyo Imperial University, had examined the action of "several of these antioxydants, • • • upon the oxidation of drying oil," linseed oil being chosen as the drying oil. Nine anti-oxidants of rubber are listed as having been used in the experiments, viz., "(1) V. G. B."; "(2) Neozone Standard"; "(3) Baygal 'C'"; "(4) Neozone C"; "(5) Baygal 'D'"; "(6) Neozone A"; "(7) Neozone D"; "(8) Albasan," and "(9) Baygal 'A'." None of these, as we understand it, is the same in chemical composition as appellant's oxidation controller consisting of a ketone and an amine in some one of their respective forms as defined in the claims.

It has been said already that the Examiner cited the Japanese publication as cumulative. The Board says of it:

The Japanese publication also discusses the use of anti-oxidants with drying oil and mentions a number found to be suitable, among them several previously known to be anti-oxidants of rubber. The publication makes the general statement that:

"Antioxydants of rubber have all antioxygenic action toward linseed oil, although their activities are varied according to their kinds."

Appellant argues with respect to the substances used in the experiments by the Japanese that the several neozones are all in the same general class and are well known as rubber anti-aging materials; that he is informed that "Baygal 'A'" is the same as "Neozone A" and "Baygal 'C'" is "Neozone D"; that in any event it is reasonable to assume that the neozones and baygals are closely related substances; that of the other two, "V. G. B." is an acetaldehyde-aniline condensate made by the United States Rubber Company, and is a well known antiager for rubber, and from these facts deduces that "it is reasonable to assume that these nine examples are of one general class and two specific instances, or three in all." Further, when commenting on the excerpt from the article quoted above and the Board's remark thereon, the brief says:

This is a statement based upon tests of at most six substantially different substances, and refers *only* to these substances. It summarizes the results of the *tests made by the authors* and is not a general statement applicable to all anti-oxidants of rubber. As quoted in the opinion of the Board of Appeals • • •, it would seem to be a general statement, but it is merely a statement that in these particular researches a limited number of examples were found to be anti-oxidants more or less useful in the treatment of linseed oil. If given the connotation adopted by the Board, the quoted statement is untrue.

It is noted that the Japanese article states "The rubber-antioxydants on the market can now be reckoned by about twenty and so." Granting that each of the nine agents experimented with in the drying oil art by the authors of the article was a separate substance, it remains true that these constituted only a minority of all the rubber-vulcanization agents stated to be "on the market," and we have no evidence of experiments by them with the majority. As a matter of fact, the record already outlined indicates that there are many more than twenty rubber anti-oxidants, appellant himself having directly or indirectly found at least twenty-two to be useless for his purpose.

Appellant cites numerous authorities in support of his contention that catalytic action is unpredictable and that chemical discoveries are empirical and are patentable even though arrived at by a process of exclusion through research. Among such authorities are *Corona Cord Tire Company* v. *Dovan Chemical Corporation*, 276 U. S. 358, 370 O. G. 1011; *United Chromium, Inc.* v. *International Silver Co.*, 53 F.(2d) 390 (a case in which the patent was finally declared void but upon the ground that it was issued to the wrong party and not upon any ground here pertinent), with its cited cases; *Toledo Rex Spray Co.* v. *California Spray Chemical Co.*, 268 Fed. 201; *Celluloid Manuf'g Co.* v. *American Zylonite Co. et al.*, 35 Fed. 301; *King et al* v. *Anderson et al.*, 90 Fed. 500, and *Diversey Corporation* v. *Mertz*, 13 Fed. Supp. 410.

[2] All the cases so cited were infringement proceedings and, as of course, related to patents which had been granted, not to applications for patents. In considering the grant of an application the Patent Office tribunals are not required always to take as broad a view as the courts sometimes take in upholding the validity of a patent once granted. Nevertheless, in chemical cases in particular, some experimentation is practically always necessary and the difficulty lies in drawing the line of demarcation between mere skill and invention. Upon the record in this case we feel constrained to hold that invention was present. Any doubt which may exist should be resolved in favor of applicant.

It seems to be taken for granted that all the claims stand or fall together; hence there is no occasion to analyze them or differentiate between them.

The decision of the Board of Appeals affirming the decision of the Examiner is reversed.

Reversed.

Interference Notices

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Florida Citrus Products Corporation, its assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 15, 1927, No. 224,038, to Florida Citrus Products Corporation, Haines City, Florida, and 136 Franklin St., New York, N. Y., and the notice of such proceeding sent by registered mail to said Florida Citrus Products Corporation at the said addresses having been returned by the post office as undeliverable, notice is hereby given that unless said Florida Citrus Products Corporation, its assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Charles N. Cox, his assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 21, 1928, No. 239,038, to Charles N. Cox, 421 Flamingo Drive, West Palm Beach, Florida, and the Office having been unable to obtain satisfactory service upon said Cox, notice is hereby given that unless said Charles N. Cox, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

TRADE-MARKS

OFFICIAL GAZETTE, DECEMBER 7, 1937

[VOL. 485. No. 1]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 2

Receptacles

Ser. No. 395,446. WALDO DE WILDE, Pendleton, Oreg. Filed July 20, 1937.

DIVIDEND DAY

For Receptacles for Tickets Consisting of a Cylindrical Wooden Container Provided with a Combination Lock and Mounted on a Base Having the Appearance of a Safe and Having a Slot in the Top for the Insertion of Tickets.

Claims use since June 21, 1937.

CLASS 3

Baggage, Animal Equipments, Portfolios, and Pocketbooks

121,451. BOOTS, SHOES, AND SLIPPERS MADE OF LEATHER. Registered April 30, 1918. K-K SHOE COMPANY. Renewed April 30, 1938, to J. W. & A. P. Howard Company, Corry, Pa., a corporation of Pennsylvania, assignee.

121,455. CORSETS, BRASSIÈRES, AND LADIES' UNDERWAISTS. Registered April 30, 1918. KOPS BROS. Renewed April 30, 1938, to I. B. Kleinert Rubber Company, New York, N. Y., a corporation of New York, assignee.

121,478. CASKET HARDWARE—NAMELY, HANDLES, PLATES, ESCUTCHEONS, AND SCREWS. Registered April 30, 1918. NATIONAL CASKET COMPANY, New York, N. Y. Renewed April 30, 1938, to National Casket Company, Inc., Boston, Mass., a corporation of New York, by change of name.

121,563. MINERAL WATER. Registered May 7, 1918. LOUISE A. PAGE. Renewed May 7, 1938, to James W. Page, Slaterville Springs, N. Y., assignee.

LABELS

REGISTERED DECEMBER 7, 1937

50,429.—*Title:* COWBOY PEPPERMINT GUM. For Peppermint Gum. WILLIS G. EDWARDS, Berkeley, Calif. Published April 7, 1937.

50,430.—*Title:* DOVE BRAND. For Open Kettle Rendered Lard. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,431.—*Title:* DOVE BRAND. For Pure Refined Lard. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,432.—*Title:* DOVE BRAND. For Fresh Pork Sausage. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,433.—*Title:* DOVE BRAND. For Sugar Cured Meats. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,434.—*Title:* DOVE BRAND. For Sugar Cured Picnics. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,435.—*Title:* DOVE BRAND. For Sugar Cured Ham. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,436.—*Title:* DOVE BRAND. For Sugar Cured Bacon. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,437.—*Title:* DOVE BRAND. For Smoked Sausage. THE E. KAHN'S SONS CO., Cincinnati, Ohio. Published October 27, 1937.

50,438.—*Title:* KROGER'S COUNTRY CLUB CLOCK BREAD. For Bread. THE KROGER GROCERY & BAKING COMPANY, Cincinnati, Ohio. Published January 1, 1936.

50,439.—*Title:* LABKON'S KOSHER SOAP FLAKES. For Soap Flakes. DAVID W. LABKON, doing business as Labkon Products Co., Chicago, Ill. Published November 10, 1937.

50,440.—*Title:* THE JUNIOR. For Frocks. LIBERTY FROCK COMPANY, Kansas City, Mo. Published October 2, 1937.

50,441.—*Title:* MANNINGS COFFEE—BROWN BAG BLEND. For Coffee. MANNINGS, INC., San Francisco, Calif. Published October 25, 1937.

50,442.—*Title:* PRIDE OF JORDAN CREAMERY BUTTER. For Butter. MENASHA PRODUCTS COMPANY, Menasha, Wis. Published October 22, 1937.

50,443.—*Title:* RAINBOW BRAND OLEOMARGARINE. For Oleomargarine, MENASHA PRODUCTS COMPANY, Menasha, Wis. Published October 25, 1937.

50,444.—*Title:* LAND O'LAKES. For Canned Peas. OCONOMOWOC CANNING COMPANY, Oconomowoc, Wis. Published September 15, 1937.

50,445.—*Title:* PADRE SEC. For California Champagne. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published October 30, 1937.

50,446.—*Title:* AIR-VENT PLATTER COVER. For Water Proof Silk Covers for Food Platters. ARNO REINHOLD, doing business as Reinhold Company, Cleveland, Ohio. Published September 1, 1937.

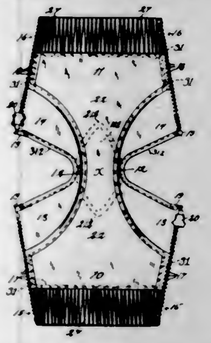
50,447.—*Title:* CHAMI-FAB. For Interlinings for Coats. SONNEBORN & MEYRICH, New York, N. Y. Published September 27, 1937.

50,448.—*Title:* WILSO. For a Skin Cleanser. J. LEVERS WILSON, Pitman, N. J. Published October 1, 1937.

PRINTS

REGISTERED DECEMBER 7, 1937

16,602.—*Title:* PRICE LIST ON SOME OF MY STUFF. For Candy and Nuts. AWFUL FRESH MACFARLANE, Oakland, San Francisco, and Berkeley, Calif. Published November 1, 1937.



16,603.—*Title:* WHITE HOME COAL. For Coal. ARNOLD BUEKER, Hamilton, Ohio. Published October 1, 1937.

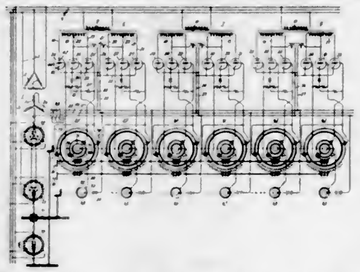
20,567
BATHING SUIT REMOVABLE WHILE DRESSED

Leonard H. Bachelis, Los Angeles, Calif., assignor, by direct and mesne assignments, to Olympia Knitting Mills, Inc., Olympia, Wash., a corporation of Washington

Original No. 1,995,531, dated March 26, 1935, Serial No. 697,130, November 8, 1933. Application for reissue May 29, 1935, Serial No. 24,099

3 Claims. (Cl. 2—224)

3. A swimming garment terminating at its upper edge in waist gripping means to support the garment upon a wearer, and including a front portion incorporating a portion of the waist gripping means and formed to extend half-way around the lower part of the wearer's body and hips, a back portion that is of substantially the same width, length and form as the front portion, and incorporates the remainder of the waist gripping means, and formed to extend around the other half portion of the wearer's body and hips, separable slide fasteners for connecting the meeting side edges of the front and back portions into closed seams, said front and back portions being joined through the crotch to form an outer crotch cover, and an inner crotch cover supported from said waist gripping means and joined to the front and to the back portions adjacent to the waist of each, and being unsecured thereto through the crotch portion, for free movement independently of and relative to the outer crotch cover.



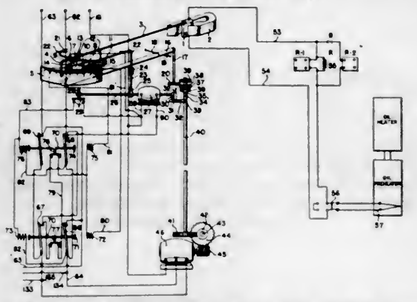
20,568
ALTERNATING CURRENT MOTOR SYSTEM

Burnice D. Bedford, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Original No. 2,077,206, dated April 13, 1937, Serial No. 86,752, June 23, 1936. Application for reissue August 31, 1937, Serial No. 161,807

16 Claims. (Cl. 172—274)

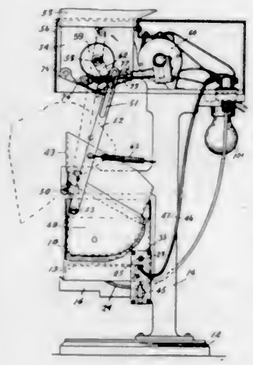
1. In combination, an alternating current circuit, a dynamo-electric machine having an inducing winding connected to be energized from said alternating current circuit and having an induced winding, and electric translating apparatus interposed between said alternating current circuit and said induced winding for controlling an operating condition of said dynamo-electric machine comprising electric valve means for transmitting energy between said alternating current circuit and said induced winding, means for controlling said electric valve means to control said



operating condition of said machine and means for independently controlling said electric valve means to control the power factor of the current supplied by said alternating current circuit to said translating apparatus.

20,569
CONTROL METHOD AND APPARATUS

Richard P. Brown, Philadelphia, Pa., assignor to The Brown Instrument Company, Philadelphia, Pa.

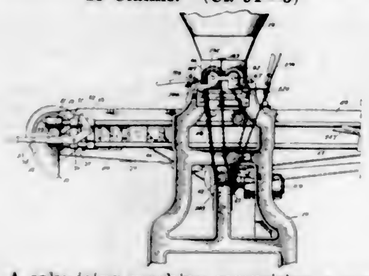


Original No. 1,891,617, dated December 20, 1932, Serial No. 237,103 December 1, 1927. Application for reissue May 4, 1937, Serial No. 140,770

21 Claims. (Cl. 236—70)

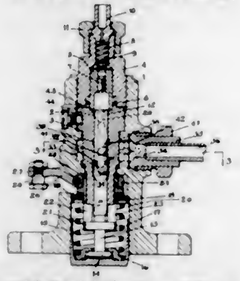
1. In a control system, a device to be maintained at a predetermined temperature, a motor mechanism for controlling the rate of fuel supply to said device and a control mechanism for variably operating said motor mechanism in accordance with the variations in temperature of said device from a predetermined temperature, said control mechanism comprising a galvanometer with a pointer movable from a normal position in accordance with the departure of said temperature from said predetermined value and contacts controlled by said pointer when deflected from its normal position, the contacts being arranged to move in the direction of the deflection of said pointer, said motor mechanism being arranged under predetermined conditions to be non-operative to vary said fuel supply in response to the first few operations thereof by said control mechanism.

20,570
COOKING MACHINE
George H. Bushway, Hampton, N. H., assignor to Electricooker, Inc., Newburyport, Mass., a corporation of Massachusetts
Original No. 2,074,044, dated March 16, 1937, Serial No. 89,517, July 8, 1936. Application for reissue September 17, 1937, Serial No. 165,063
23 Claims. (Cl. 53—7)



1. In a cooking machine, a container for cooking liquid, heating means therefor, a normally stationary electric motor, means arranged to be actuated by said motor to remove cooked material from the liquid, and a thermostat arranged to be influenced by the temperature of the liquid in the container and to set said motor in operation to remove the material when the temperature of the liquid is raised to a predetermined point.

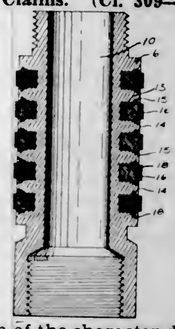
20,571
MEDICAMENT PACKAGE AND PROCESS
Paul G. Heineman, Albany, N. Y., assignor to Cook Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Original No. 1,967,439, dated July 24, 1934, Serial No. 222,150, filed September 26, 1927. Renewed December 7, 1933. Application for reissue July 24, 1936, Serial No. 92,394
7 Claims. (Cl. 128—218)



7. An aseptic package for medicaments which is particularly adapted to facilitate a dilution of the contents thereof without contact with the air which comprises, in combination, a glass tube, a resilient plug inserted in the tube at one end and having a cavity opening interiorly and being constructed and arranged so that inward movement thereof through the tube is prevented; and another pierceable resilient plug substantially adjacent to the plug having the cavity and so constructed and arranged that it forms a closed, sterile chamber within the tube, in conjunction with the first plug, which chamber exceeds in volume the capacity of the cavity provided by the first plug, said second plug being freely slidable through the tube.

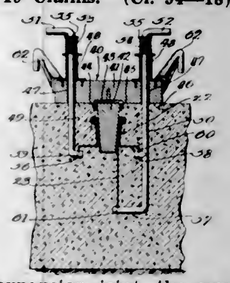
20,572
CAKE ICING MACHINE
John R. Litty, and Trued B. Lundin, deceased, late of Philadelphia, by Elizabeth H. Litty, assignee, Philadelphia, Pa.
Original No. 1,881,747, dated October 11, 1932, Serial No. 443,982, April 14, 1930. Application for reissue July 8, 1937, Serial No. 152,584
18 Claims. (Cl. 91—3)

1. A cake icing machine comprising a movable support for cakes, an icing receptacle having means therein for feeding the icing from the bottom thereof directly onto said cakes, a main shaft for driving said support and said means, and means for regulating the relative speed between said moving support and said icing feed.



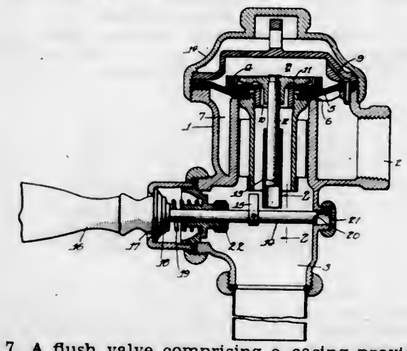
20,573
LIQUID FUEL INJECTION PUMP
Rudolf L'Orange, Stuttgart-Feuerbach, Germany, assignor of one-half to Frederick Richard Simms, London, England
Original No. 1,999,330, dated April 30, 1935, Serial No. 677,724, June 26, 1933. Application for reissue April 2, 1937, Serial No. 134,691
11 Claims. (Cl. 103—41)

1. In a liquid fuel injection pump of the type in which the pump output is varied by by-passing fuel from the pump chamber at the end of the injection stroke, the combination comprising a main pump body, a cylinder disposed within said pump body and including a pump chamber, a plunger reciprocable in said cylinder and pump chamber and rotatably adjustable with respect thereto, a suction passage formed interiorly and axially of said plunger, means for opening and closing said suction passage during reciprocation of the plunger within said cylinder and pump chamber, a spill passage disposed wholly exteriorly of the plunger and constituted by one part comprising a groove having closed ends and generated helically around the axis of the plunger and formed in the outer surface of the plunger and another part comprising a recess having a control edge formed in the cylinder wall, said recess being in constant communication with the pump chamber, the cooperating edges of said spill parts being parallel to each other, and an annular recess provided in the cylinder



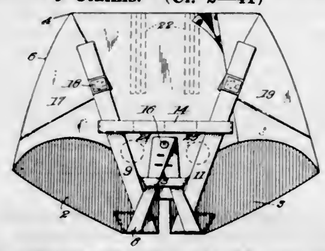
wall around the plunger and communicating constantly with said helical groove, around which recess the fuel is caused to circulate rapidly due to the direction of flow imparted thereto by the helical groove so that the discharge of fuel from the said annular recess is facilitated, and a discharge port for said annular recess.

20,574
PUMP PLUNGER
John N. Martin, Tulsa, Okla.
Original No. 2,095,708, dated October 12, 1937, Serial No. 140,703, May 4, 1937. Application for reissue October 19, 1937, Serial No. 169,920
3 Claims. (Cl. 309—23)



1. In a pump of the character described, a barrel, a pump plunger arranged in the barrel and comprising a cylindrical body, rings rigidly united with said body and extending laterally therefrom, said rings being spaced apart and forming intervening grooves substantially rectangular in cross section, and packing rings mounted in said grooves and engaging said barrel, said packing rings being normally of a size and shape to substantially fill said grooves and characterized by their ability to swell a predetermined amount.

20,575
EXPANSION JOINT FOR PAVEMENTS AND THE LIKE
Clifford Older, Wilmette, Ill.
Original No. 1,918,554, dated July 18, 1933, Serial No. 555,949, August 8, 1931. Application for reissue June 15, 1935, Serial No. 26,852
19 Claims. (Cl. 94—18)

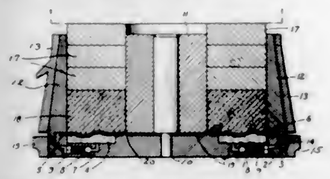


1. In an expansion joint, the combination of a pair of sections of concrete with an expansion strip having anchoring portions embedded in each of said concrete sections, a pair of substantially parallel flanges joined together to form a main expansible fold, and a pair of substantially cylindrical beads joining said parallel flanges with said anchoring portions.

20,576
FLUSH VALVE
William E. Sloan, River Forest, Ill.
Original No. 2,038,135, dated April 21, 1936, Serial No. 513,530, February 5, 1931. Application for reissue April 15, 1937, Serial No. 137,126
9 Claims. (Cl. 137—93)

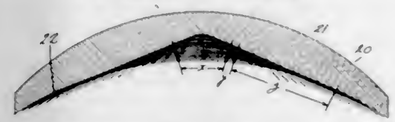
7. A flush valve comprising a casing provided with an inlet and an outlet; a main valve therein dividing the casing into two chambers, an upper chamber and a lower chamber; said main valve being provided with a passageway which connects the upper chamber with the outlet; an auxiliary valve carried by the main valve and controlling said passageway therethrough; a stem for said auxiliary valve; a handle movably mounted in a side wall of the casing; an actuating device mounted between the handle and the end of said stem and adapted to be moved by said handle to engage said stem when the rod is moved so as to open the auxiliary valve and hold it open a predetermined length of time; and means accessible while the handle is in its operative position for adjusting the position of said actuating member so as to vary the length of time it engages said stem to hold said auxiliary valve open.

20,577
GIRDLE
Maria G. Waksmundzka, Washington, D. C.
Original No. 2,022,751, dated December 3, 1935, Serial No. 759,564, December 28, 1934. Application for reissue May 29, 1936, Serial No. 82,654
9 Claims. (Cl. 2—41)



5. An article of the character described, comprising a front portion and a rear portion, a strap extending from the rear portion to the front portion, and a second strap extending from the rear portion to the front portion, and straps being adapted to pass between the thighs and meeting each other at the front portion at a point above the pubic region.

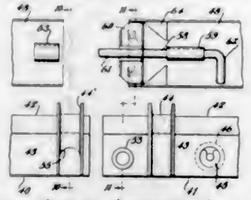
PATENTS



GRANTED DECEMBER 7, 1937

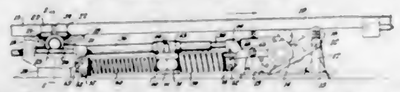
2,101,015
HYDRAULIC MOLD
Edward Anderson, Dayton, Ohio
Application November 30, 1934, Serial No. 755,326
12 Claims. (Cl. 18—34)

1. A mold for plastics, including a base, separable segmental side walls having interlocking engagement with the base, a ring exteriorly surrounding the segmental wall sections for holding the wall sections in assembled relation, a flexible cover for the base upon which a plastic deposit may be received, and a fluid body confined between the flexible cover and the base and subject to displacement by unequalized pressure of the plastic deposit if placed thereon whereby the resistance to the pressure of the deposit will be equalized.



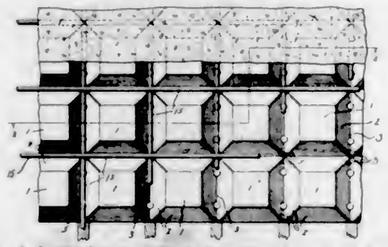
2,101,016
LENS
Howard D. Beach, Buffalo, N. Y.
Application August 8, 1935, Serial No. 35,332
5 Claims. (Cl. 88—57)

1. A spherically corrected lens comprising a body of light transmitting and refracting material having one convex arcuate face, and having its opposite face of generally concave form the medial section of which is a smooth, continuously flowing curve, composed of negative, flat and positive concentric portions each formed of a multiplicity of minute, concentric, annular zones of imperceptible width and of different radii of curvature arranged in consecutive order and in successive numerical value, and with the centers of curvature of all of said zones located upon a common optical axis.



2,101,017
CONVEYER SECTION CONNECTION
Charles N. Bebinger, New Philadelpha, Ohio, assignor to La-Del Conveyor & Mfg. Co., New Philadelphia, Ohio, a corporation of Ohio
Application September 12, 1935, Serial No. 40,293
2 Claims. (Cl. 198—204)

1. In a conveyer having longitudinally extending belt roller enclosing members arranged end to end, a gate slidably mounted on the end of one longitudinal member and having a longitudinal projection, and a tubular member on the adjacent end of another longitudinal member for receiving said projection when the gate is

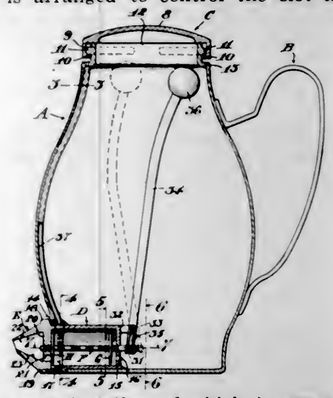


moved to close the gap between the longitudinal members.

2,101,018
CONVEYER DRIVING MECHANISM
Charles N. Bebinger, New Philadelphia, Ohio, assignor to La-Del Conveyor & Mfg. Co., New Philadelphia, Ohio, a corporation of Ohio
Application March 3, 1937, Serial No. 128,822
12 Claims. (Cl. 198—218)

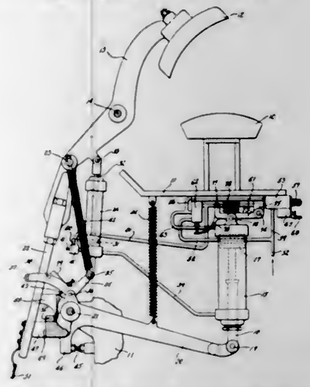
1. Driving mechanism for a shaking conveyer, including a driving crank, driving means connected to the conveyer, a reversible spring drive unit swiveled on said driving means, and means for selectively detachably connecting either end of said spring drive unit to said driving crank.

2,101,019
MOLDING FORM FOR STRUCTURAL MATERIAL
David M. Bowes, Bath, N. Y.
Application May 4, 1934, Serial No. 723,990
21 Claims. (Cl. 25—131.5)



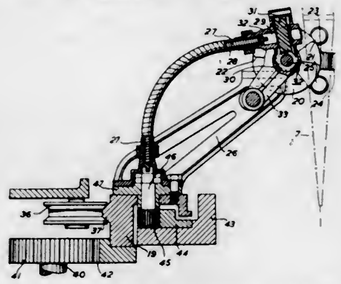
1. A form for molding structural material comprising a strip of a pliable plane substance bent to form a plurality of raised sections separated from one another by intersecting channels.

2,101,020
CREAM DISPENSER
William F. Coleman, Richmond, Calif.
Application February 1, 1937, Serial No. 123,390
4 Claims. (Cl. 221—104)



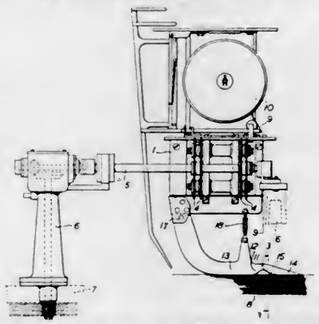
1. In a liquid dispenser, a tiltable container, a measuring chamber in said container, a discharge spout leading from said chamber, a septum between said spout and chamber formed with

a slot, said chamber having an end wall formed with a slot opening to the interior of said chamber, a valve stem slidably carried by said septum and wall, a pair of disc valves carried by said valve stem interiorly of said chamber one of which is arranged to control the slot in said



septum and the other of which is arranged to control the slot in said wall, and means interiorly of said container connecting with said valve stem moveable under tilting movement of the container for shifting said valve stem to alternately open and close said slots.

2,101,021
PRESSING MACHINE AND CONTROL MECHANISM
Joseph P. Daly, New York, N. Y., assignor to The American Laundry Machinery Company, Norwood, Ohio, a corporation of Ohio
Application October 6, 1934, Serial No. 747,173
22 Claims. (Cl. 38—41)

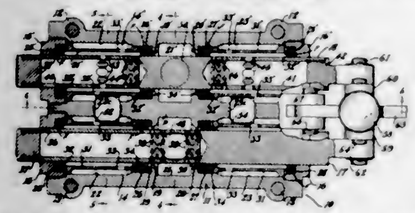


1. A pressing machine comprising cooperating relatively movable pressing members, a fluid actuated cylinder and piston motor for producing such movement, motion transmitting mechanism effective during the latter part of the piston stroke for applying final pressure between said members and including separable parts effective to transmit motion only when the pressing members are in close proximity, power transmitting mechanism operatively connected with said piston for producing relative motion between said pressing members and effective during the first part of the piston stroke to move said members to close proximity and to couple said parts in effective position, and operator controlled means for actuating said motor.

2,101,022
CIRCULAR LOOM
Frank Corbyn Hale and Robert Yeadon, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware
Application July 16, 1935, Serial No. 31,598
In Great Britain July 23, 1934
11 Claims. (Cl. 139—13)

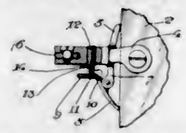
1. In a circular loom employing rotatable vane wheels adapted to pass through the warp threads into engagement with a shuttle within the warp shed, a rotatable shaft for supporting and driving said vane wheels, a flexible shaft in driving connection with said vane wheel shaft, means for adjusting said vane wheel shaft towards or away from the loom axis while maintaining said driving connection, and means for rotating said flexible shaft.

2,101,023
CIRCULAR LOOM
Frank Corbyn Hale and James Russell Yorke, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware
Application July 28, 1936, Serial No. 92,958
In Great Britain August 31, 1935
6 Claims. (Cl. 139—13)



1. A circular loom provided with means for shedding the warps in connection with each shuttle thereof, and a plurality of shuttles each having a base extending rearwardly of the point at which weft is delivered from the shuttle to a point beyond that at which shedding for the next shuttle commences, and which is adapted to beat up the weft into the open shed into which it is laid by the shuttle.

2,101,024
HIGH SPEED TRANSPORTATION SYSTEM
John O. Heinze, Detroit, Mich., assignor, by direct and mesne assignments, to Heinze Development Company, a corporation of Michigan
Application November 17, 1933, Serial No. 698,392
4 Claims. (Cl. 104—247)

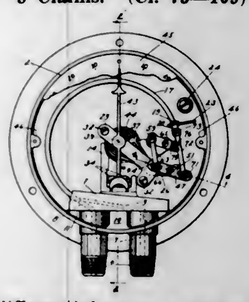


1. A high speed transportation system including a way having guide members extending along opposite sides thereof for guiding a motor vehicle in its travel along said way, said way having a lateral outlet to permit the driving of said vehicle from said way; and a motor vehicle to travel along said way, said vehicle having ground wheels for travel upon said way and upon the highways, steering mechanism for steering said vehicle independently of said guide members of said way, horizontally disposed guide wheels upon said vehicle for travel along said guide members of said way, pivotally supported bell cranks upon which said guide wheels are mounted, means upon which each of a pair of ground wheels is mounted, said means being connected to said vehicle for pivotal movement in steering the vehicle, means for pivotally mounting each of said wheels for vertically yielding movement under load independently of the other or others, springs to yieldingly resist independent vertical pivotal movement of said mounting means and means for operatively connecting said bell cranks upon which said guide wheels are mounted and said means upon which said ground wheels are mounted for deflecting said ground wheels from their normal path of travel to steer the vehicle away from the guide member of the way into contact with which one of the guide wheels is brought by a side thrust of the vehicle.

2,101,025
PRESSURE VALVE
Nathan C. Hunt and Samuel C. Chessman, Salem, Ohio; said Chessman assignor to said Hunt
Application December 28, 1936, Serial No. 117,808
13 Claims. (Cl. 277—12)

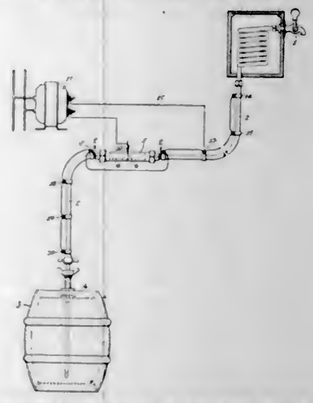
2. In fluid pressure valve construction, a valve housing having spaced longitudinal bores formed and extending entirely therethrough therein, a hollow cylindrical plunger member closed at both ends slidably mounted in and extending entirely through each bore, said valve housing having longitudinally spaced annular channels formed therein around each plunger member, walls forming a cross passage providing communication between two opposite annular channels, channel-shaped pressure sealed packing rings in each of said opposite annular channels, walls forming an inlet passage communicating with another of said annular channels around one of said plunger members, an exhaust passage communicating with an opposite annular channel around the other plunger member, and an outlet passage communicating with said cross passage, and each of said plungers having longitudinally spaced ports through their tubular walls for providing communication between the longitudinally spaced annular channels surrounding said plunger.

2,101,026
EYEGLASSES
Morris Kaplan, Brooklyn, N. Y.
Application October 14, 1936, Serial No. 105,477
7 Claims. (Cl. 88—47)



1. In an eye glass, the combination with a strap of a lens mounting having means at one side of the strap for engaging the rim of a lens, of a detent pivoted intermediate its ends at the opposite side of said strap and having a part at one side of its pivot in position to engage the rim of the lens, means co-operating with the detent at the opposite side of its pivot thereby to force the detent into engagement with the lens rim, and cushioning means for limiting the clamping action of the detent on the lens.

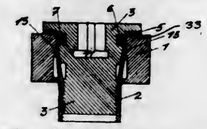
2,101,027
DUSTING MITTEN
David Karger, Milwaukee, Wis., assignor to Eagle Knitting Mills, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application May 8, 1936, Serial No. 78,610
1 Claim. (Cl. 15—227)



A mitten, comprising, a closely knit body of soft yarn having a closed end and a single elongated hollow substantially cylindrical seamless portion formed integrally with said end to provide a tubular bag for the reception of a hand, a multiplicity of continuous relatively large loops of the same material knitted integrally with and providing a shaggy covering hugging and completely concealing the entire exterior of said body, and an elastic knitted substantially cylindrical seamless wrist band of lesser normal diameter than said cylindrical portion attached to and extending away from the opposite end of said bag, said bag and band being freely rotatable about a wearer's hand so as to present all externally looped portions thereof to the palm side.

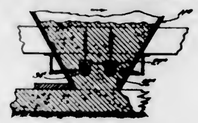
2,101,028
DIFFERENTIAL GAUGE
Maximilian Klein and Bernhard Willach, Sellersville, Pa., assignors to United States Gauge Company, Sellersville, Pa., a corporation of Pennsylvania
Application June 12, 1935, Serial No. 26,277
5 Claims. (Cl. 73—109)

5. In a differential gauge, a support, a bracket mounted on said support, an indicator and indicator operating means carried by said bracket, two pressure responsive devices carried by said bracket and linkage mechanism operatively connecting said devices to said operating means, said linkage mechanism including a bodily movable lever mounted on an adjustable pivot on said operating means, a lever pivotally mounted on said bracket and parallel to said first named lever, a link connecting adjacent ends of said levers, said link being adjustable transversely of one lever and longitudinally of the other, a link connecting one of said devices to the free end of one of said levers and a link connecting the other of said devices to the free end of the other lever, said last named links being adjustable longitudinally of said levers.



2,101,029
APPARATUS FOR PREVENTING BEER SETTLING
William G. Koerber, Detroit, Mich., assignor to Karl A. Zimmerer Manufacturing Co. Inc., Detroit, Mich., a corporation of Michigan
Application November 21, 1935, Serial No. 50,823
7 Claims. (Cl. 204—26)

1. The combination of a storage container for beer, a beer delivery means remote from said container, a tube connecting said container and said delivery means, said tube being composed of metallic sections with a non-metallic section interposed therebetween, an electric terminal internally of said non-metallic section in spaced relation with said metallic sections, and electric lines connected to a source of electrical energy, one of said lines being connected to said terminal, the other of said lines being connected to at least one of said metallic sections.



7. The method of preserving the cleanliness of the inside walls of a beer delivery line which consists in establishing a linear flow-path for the beer through the line with the flow path presenting successive and spaced linear zone characteristics, and subjecting the flowing beer to the action of a source of electrical energy while passing through the succession of zones with the energy of adjacent zones of opposite polarity.

2,101,030
EXPANSION-PLUG FOR BARRELS AND OTHER TANKS, FIRE-TUBE AND WATER-TUBE BOILERS
Willy Kunze, Leipzig, Germany
Application January 26, 1934, Serial No. 708,471
In Germany March 21, 1933
3 Claims. (Cl. 220—24.5)

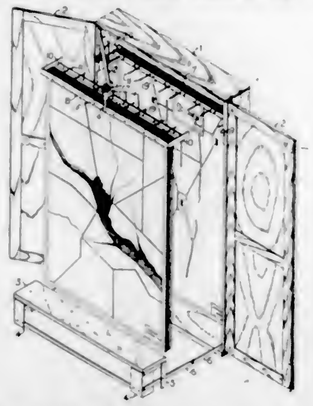
1. A bung device for barrels, petrol tanks, or the like comprising in combination: a plug having at one end a flange for covering a bung hole and external screw threads at the other end, and also having an annular conical surface between said flange and said threads and an annular groove between said conical surface and said flange; a packing ring upon said plug under said flange; a resilient packing ring in said annular groove; a pressure ring for compressing said packing ring in said groove; a sleeve adapted to fit in a bung hole and over the threaded end of the plug, said sleeve having on one end internal screw threads for engaging the threads of said plug and at the other end longitudinal slots and an annular conical flange adapted to pass over the conical surface of said plug and to be compressed thereby against the bung hole.

2,101,031
APPARATUS FOR HANDLING CONCRETE AND THE LIKE
Charles E. Little, Los Angeles, Calif.
Application August 28, 1933, Serial No. 687,105
14 Claims. (Cl. 94—46)

1. Apparatus for handling concrete and like material including, a hopper adapted to be operated along a form to pass material into the form, an element movable along the form with the hopper and extending through the material flowing from the hopper, means carrying the element for free vibration relative to the hopper, and means for vibrating the element to vibrate material in the hopper and the material in the form adjacent the discharge of the hopper.

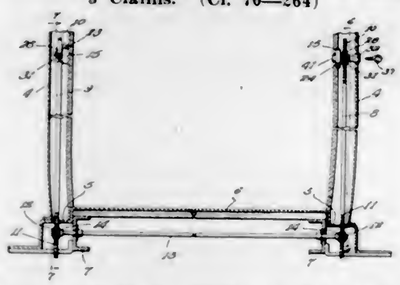
2,101,032
METHOD FOR THE RECOVERY OF ARALKYL ETHERS OF CELLULOSE
Eugene J. Lorand, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application October 6, 1934, Serial No. 747,209
10 Claims. (Cl. 260—152)

1. The method of recovering an aralkyl ether of cellulose in the form of a firm, porous, granular precipitate from the mixture resulting from the reaction leading to its formation, which includes first adding to the reaction mixture an organic liquid which is a solvent for organic impurities contained therein and a non-solvent for said aralkyl ether of cellulose selected from the group consisting of liquid aliphatic alcohols, liquid aliphatic ethers and liquid aliphatic hydrocarbons, in amount sufficient to substantially reduce the viscosity of the reaction mixture but insufficient to cause the separation thereof into two phases, and then admixing the thinned reaction mixture with an additional quantity of said organic liquid larger than that first added.



2,101,033
ANTENNA BELT
Sidney F. Mashbir, Washington, D. C., Frank G. Kear, Minersville, Pa., Gomer L. Davies, Cleveland, Ohio, and William H. Orton, Washington, D. C., assignors to Washington Institute of Technology, Washington, D. C., a corporation of Delaware
Application May 21, 1934, Serial No. 726,820
2 Claims. (Cl. 250—14)

1. An antenna belt comprising an endless hollow loop of impervious material having oppositely disposed portions thereof extending in opposite directions at acute angles to the plane of the loop, and other portions connecting said first-named portions and being disposed substantially at right angles to the plane of the loop, and a plurality of turns of wire disposed within the material of said loop.

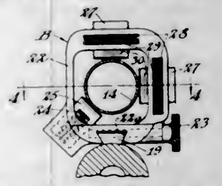


2,101,034
DRAWING AND MAP FILE
Alfred H. Meuche, Washington, D. C.
Application January 25, 1936, Serial No. 60,826
24 Claims. (Cl. 40—28)

1. In a filing unit for loose sheets, a pair of complementary hanger members, one of said hanger members being fixed, a support upon which the other hanger member is movable relative to the fixed member, overlapping relatively spaced pins carried by the respective hanger members engageable through registering holes in the sheets to be filed and upon which such sheets are capable of to and fro sliding motion, guide means for the movable hanger member by which the pins carried thereby are registered with corresponding holes in sheets suspended from the pins of the other member as the mov-

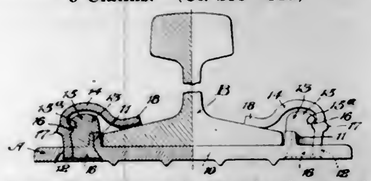
able hanger member approaches the fixed member, detent means for restricting the suspended sheets to the limits of the pins of the respective hangers when the hangers are separated, and means for automatically adjusting the detent means into and out of sheet restricting relation controlled by the relative movement of the movable hanger.

2,101,035
SECURING MECHANISM FOR AUTOMOBILE DOORS
John Mistretta, New York, N. Y.
Application July 24, 1936, Serial No. 92,401
3 Claims. (Cl. 70—264)



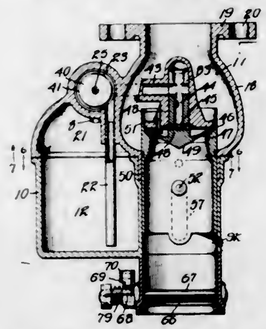
1. In a device for simultaneously locking all doors of a vehicle from a central point comprising a fastener for each pair of front and rear doors having a pair of rack plungers mounted therein, a pinion meshing with the racks of each pair of plungers whereby the latter may be moved in opposite directions, a pinion shaft for each pinion, a driven shaft mounted upon and extending transversely of the vehicle frame, gears keyed to the opposite ends of said driven shaft, rack bars each having racks at their lower ends for engaging said gears, and racks at their upper ends, means for operatively connecting the racks at the upper ends of said rack bars to said pinion shafts and means for rotating one of said pinion shafts from either side thereof.

2,101,036
SILO
George A. Olbrich, Minneapolis, Minn.
Application October 3, 1936, Serial No. 103,893
3 Claims. (Cl. 20—1.4)



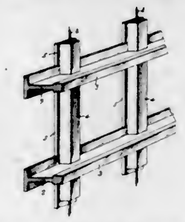
1. In a silo, a sectional construction unit comprising a group of staves, sectional rib members to which said staves are secured, one end of said rib members being offset and extending laterally of its group of staves, the central longitudinal areas of said ribs being bent outwardly from the side portions of the ribs a distance greater than the offsets at the ends of said ribs to form reinforcing shoulders and hoops encircling said silo and supported by said shoulders.

2,101,037
TELESCOPIC SIGHT FOR GUNS
Charles M. O'Neil, Hopkins, Minn.
Application January 11, 1936, Serial No. 58,663
7 Claims. (Cl. 33—50)



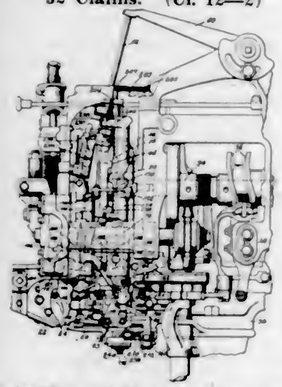
1. In telescopic gun sight construction, a telescope, a mounting engaging the forward portion of said telescope and permitting limited oscillation of said telescope relative to said mounting on a substantially vertical axis as well as on a substantially horizontal axis, a second mounting surrounding said telescope adjacent its rear end and comprising a telescope-surrounding member, a telescope-engaging member yieldingly mounted in said surrounding member and an adjustable telescope-positioning member, said positioning member being externally threaded and mounted in a portion of said surrounding member and an annular adjustment nut internally threaded and engaged with said positioning member and mounted also in a portion of said telescope-surrounding member, said positioning member extending normal to said adjustment nut.

2,101,038
RAIL SUPPORTING AND RETAINING MEANS
Victor C. Armstrong, Short Hills, N. J., assignor, by mesne assignments, to Poor & Company, a corporation of Delaware
Application September 12, 1936, Serial No. 100,551
5 Claims. (Cl. 238—349)



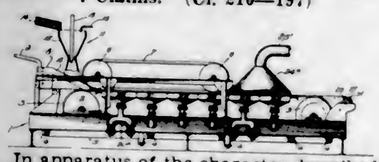
5. In combination, a tie plate having a rail seat and an opening of tapering form at one side of said seat, a filler block having a wedge-formation to interlock with said tapered opening, and a key member having an interlocking wedging engagement with said filler block and provided with a rail holding spring-tongue overlying the filler block and the rail flange, said filler block and said key member being disposed in their entireties above the bottom face of the tie plate.

2,101,039
CARBURETOR WITH CHOKE CONTROL
Arthur R. Baker, Indianapolis, Ind., assignor to Columbia Carburetor Company, Washington, D. C., a corporation of Delaware
Application March 20, 1933, Serial No. 661,809
Renewed July 29, 1935
6 Claims. (Cl. 261—64)



1. In a carburetor having a butterfly valve, means for operating said valve in response to load demands of the engine comprising means for creating a suction on the butterfly valve so as to open said valve slightly after starting of the engine, and means for maintaining said butterfly valve in an open position so long as the engine is operated at normal speed and under a normal load and means for minimizing the amount of suction required to maintain the valve in open position at operating load after the engine has come up to full operating speed, substantially as set forth.

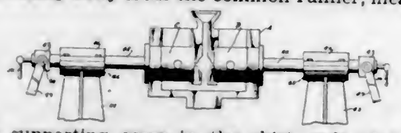
2,101,040
ALARM SYSTEM FOR DETENTION WINDOWS
Lee Bayley, Springfield, Ohio, and Robert L. Clingerman, Washington, D. C., assignors to The William Bayley Company, Springfield, Ohio, a corporation of Ohio
Application November 19, 1930, Serial No. 496,708
2 Claims. (Cl. 189—64)



1. A window assembly for penal institutions including a plurality of transversely disposed duofunctional muntin and detention bars T-shaped in cross section dividing the window into a plurality of spaces at least some of which are glazed and rectangular hollow bars extending adjacent to the stems of some of the T-bars, said bars cooperating with each other to prevent the escape of a human body through the window assembly.

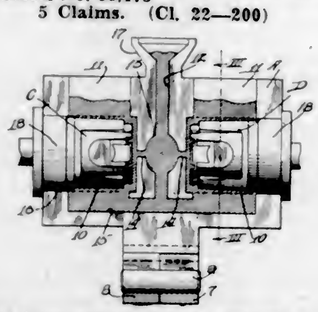
2,101,041
LASTING MACHINE
Benjamin B. Blanchard, Swampscott, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 8, 1936, Serial No. 114,840
32 Claims. (Cl. 12—2)

1. In a lasting machine, the combination with means for shaping an upper over a last, and a wiper for wiping the marginal portion of the upper inwardly over a sole on the last, of different devices arranged for alternative use respectively to drive fastenings to fasten the upper to the sole after the upper has been wiped inwardly by the wiper or to operate said wiper by a hammer blow to force the overwiped marginal portion of the upper into adhering relation to the sole in lasting the shoe with cement instead of with driven fastenings.



2,101,042
METHOD OF AND APPARATUS FOR TREATING MATERIALS
William Casey, Kingston, Ontario, Canada, assignor to Canadian Locomotive Company, Limited, Kingston, Ontario, Canada, a corporation of Canada
Application January 23, 1935, Serial No. 2,978
7 Claims. (Cl. 210—197)

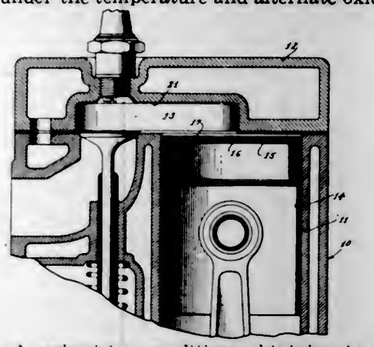
1. In apparatus of the character described, the combination with an endless filter web of means for supporting such web and causing a flow of air therethrough and the material supported thereon, said means comprising a stationary support provided with suction ports and a movable mat overlying said support and carrying said web, said mat provided with drainage grooves extending longitudinally of the mat and communicating with said suction ports.



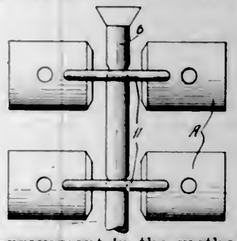
2,101,043
APPARATUS FOR MAKING PISTONS
George H. Blettner, Chicago, Ill., assignor to Renette Company, Chicago, Ill., a corporation of Illinois
Application March 2, 1935, Serial No. 8,987
5 Claims. (Cl. 22—149)

2. An apparatus for group casting of pistons comprising a mold formed with a common runner arranged to supply metal to a plurality of piston casting cavities, said mold being formed with a plurality of piston casting cavities arranged with the axes of the cavities horizontal and with the head ends of said cavities in proximity to said common runner and the skirt ends extending away from the common runner, means

for supporting cores in the skirt ends of said cavities to close said ends and form the interiors of the pistons, and a plurality of connections between said common runner and each of said cavities to supply molten metal to the larger voids of the cavities to compensate for shrinkage of the castings while cooling.



2,101,044
METHOD OF MAKING PISTONS
George H. Blettner, Chicago, Ill., assignor to Renette Company, Chicago, Ill., a corporation of Illinois
Original application March 2, 1935, Serial No. 8,987. Divided and this application March 12, 1936, Serial No. 68,473
5 Claims. (Cl. 22—200)

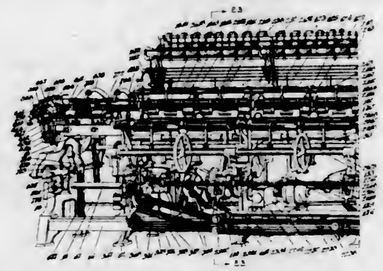


1. That improvement in the method of simultaneously casting a plurality of internal combustion engine pistons which comprises the steps of forming a plurality of piston casting cavities in a mold with the axes horizontal and the head forming ends of the cavities facing each other, forming in the mold a single feeder which when the mold is in casting position extends downwardly between and past the facing head forming ends of the cavities and sufficiently closely adjacent said ends to be in heat transfer relation therewith, forming in the mold a plurality of connections from the feeder to each cavity with one of the connections to each cavity opening into the cavity through a side of the same, and supplying molten metal to said feeder connections and cavities.

2,101,045
INTERNAL COMBUSTION ENGINE
George H. Blettner, Chicago, Ill., assignor to Renette Company, Chicago, Ill., a corporation of Illinois
Application June 6, 1936, Serial No. 83,888
3 Claims. (Cl. 123—191)

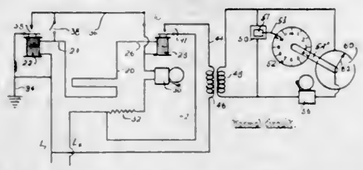
1. A piston for use in an internal combustion engine, said piston having that portion which is exposed to the gases of combustion formed of steel having a thermal insulating layer on its exposed surface consisting largely of a lacy membrane of oxides and carbides of iron, the thickness and kindling point of the steel being such that under the temperature and alternate oxidizing and carburizing conditions obtaining in the operation of an engine containing such piston said membrane of oxides and carbides of iron will persist by re-formation during continued engine operation.

2,101,046
ART OF CASTING PISTONS
George H. Blettner, Chicago, Ill., assignor to Renette Company, Chicago, Ill., a corporation of Illinois
Application July 1, 1937, Serial No. 151,335
3 Claims. (Cl. 22—209)



1. That improvement in the method of simultaneously casting a plurality of internal combustion engine pistons, which comprises the steps of forming in a mold a plurality of piston casting cavities in tier formation with their axes horizontal and with the head forming ends of the cavities in each tier facing each other, forming in the mold a single feeder which is vertical when the mold is in casting position and which extends downwardly in closely adjacent relation between and past the head ends of the cavities in the tiers, forming in the mold connections from the feeder to each cavity and pouring metal into said feeder to supply metal to the cavities on each side of the axis of each cavity in such manner that the heat of the metal in the feeder and connections tends to retard the rate of cooling of the head end portions of the piston castings.

2,101,047
METHOD OF TREATING RAILS
John Brunner, Chicago, Ill., and Arthur D. Beers, Gary, Ind.; Cora M. Brunner executrix of said John Brunner, deceased
No Drawing. Application May 16, 1933 Serial No. 671,422
2 Claims. (Cl. 148—20)

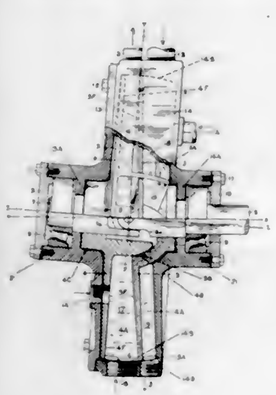


1. In the cooling of rails from a temperature above the upper critical temperature to atmospheric temperatures, the method which comprises cooling the rail to a temperature approximating but above the upper critical range, quenching the head of the rail at and adjacent its ends to a temperature below the critical range, cooling the remainder of the rail at the normal hot bed cooling rate until the head of the rail intermediate the quenched ends thereof approximates a temperature of 350° C. and retarding the cooling of the rail between the temperatures of 350° C. to about 100° C. at a rate determined by the specific steel composition and carbon content thereof.

2,101,048
UNINTERRUPTED KNITTING OF SHAPED FABRICS
Alfred E. Ischinger, Mount Penn, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania
Application September 4, 1936, Serial No. 99,503
250 Claims. (Cl. 66—82)

1. A straight united needle knitting machine of the character described, comprising means for automatically performing all operations essential to the production of one or more complete fashioned blanks in a continuous cycle of operation, a plurality of mechanisms for performing the knitting and fashioning operations in the production of the blanks, actuating means for said mechanisms, and pattern means for controlling said mechanisms during the continuous automatic cycle of operation of the machine.

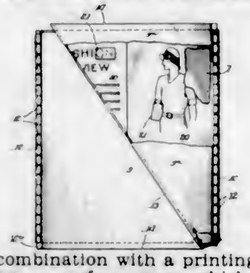
2,101,049
PROTECTIVE SIGNALING DEVICE
Robert L. Clingerman, Washington, D. C., assignor to The William Bayley Company, Springfield, Ohio, a corporation of Ohio
Application January 9, 1935, Serial No. 975
5 Claims. (Cl. 177—314)



1. A protective signaling system, comprising, a grounded source of E. M. F.; a normally closed protective circuit, including in series the winding of an emergency alarm relay, a protective conductor, the winding of a secondary alarm relay, and a primary alarm means; a secondary alarm means under the control of the contacts of the secondary alarm relay, to give a secondary signal upon deenergization of the secondary alarm re-

lay; means, including a normally open circuit, having a manually operable test switch and the contacts of the emergency alarm relay therein, connected in series with the primary alarm means, and in parallel with the winding of the secondary alarm relay; a normally open circuit energizable by the source of E. M. F., and having the contacts of the secondary alarm relay therein, and including means for energizing the secondary alarm means; whereby, opening of the protective circuit causes actuation of both alarm means, and opening of the manual switch silences both alarm means, if their actuation was caused by a ground imposed on the protective circuit, but only the primary alarm means, if their actuation was caused by an opening of the protective circuit.

2,101,050
POLISHING COMPOUND
Harry J. Hosking, Sea Cliff, N. Y.
No Drawing. Application December 19, 1936, Serial No. 116,821
6 Claims. (Cl. 51—280)

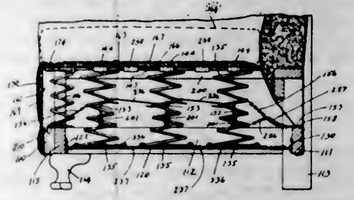


1. A composition of matter comprising a mixture of water, glue, glycerine, borax and alundum and the products of their combinations.

2,101,051
ROTARY FLUID DISPLACEMENT DEVICE
Ernest Alexander Cuny, New York, N. Y., assignor to Cunward, Inc., Brooklyn, N. Y., a corporation of New York
Application July 20, 1935, Serial No. 32,371
12 Claims. (Cl. 103—127)

2. In a fluid displacement device, a rotatable radially bladed element, a rotatable slotted element adapted to receive the blades of the first said element within its slots, a casing having a spherical chamber within which the said elements are adapted to rotate on oblique axes, suction ports in the said casing and in the said bladed element, discharge ports in the said casing, baffles associated with said bladed element adapted to periodically close said discharge ports, and means for rotating the said elements such that compression of a fluid is caused between the said elements and the said casing and is adapted to be drawn through and discharged from the ports thereof.

2,101,052
PRINTING PLATE AND METHOD OF MOUNTING THE SAME
Arthur B. Davis, Springfield, Ohio
Application June 26, 1931, Serial No. 546,951
4 Claims. (Cl. 101—415.1)

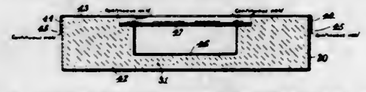


3. The combination with a printing press support having a surface upon which a printing member is to be mounted, of a separately formed expansible backing plate conforming to the contour of said surface and shiftable edgewise in any direction while lying against said support, said plate having fastening devices extending along opposite marginal edges and disposed above the surface of said support, a type-carrying sheet overlying said plate and having fastening elements spaced for engagement with said devices, said plate comprising at least two separate sections cooperating when in edgewise abutting relation to form a continuous backing for the type on said sheet and shiftable relatively to each other while said devices and elements are engaged, to expand the plate in an edgewise direction against said elements and thereby stretch said sheet over the plate surface to form a unitary printing plate assembly, and clamping devices on said support overlying the edges of said assembly and acting to fasten said assembly to said support, said clamping devices being detachable to permit of bodily edgewise adjustment of the assembly in any direction along the surface of said support.

2,101,053
FIRE ESCAPE
Peter V. Della Santina, Arthur Nelson, and Frank Della Santina, San Francisco, Calif.
Application March 18, 1935, Serial No. 11,640
6 Claims. (Cl. 228—17.3)

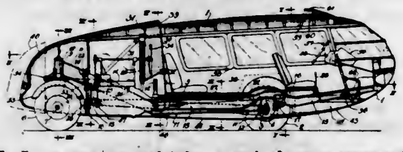
2. In a fire escape a balcony, a ladder carried by the balcony and vertically movable to raise or lower the same, a pair of guide members pivotally secured to the balcony between which the ladder is guided, means normally supporting the ladder in a raised position, means for releasing the support to lower the ladder between the guide members, and means carried by the ladder and cooperating with the pivoted guide members for swinging the lower end of the ladder outwardly to assume an inclined position as it reaches its lowered position.

2,101,054
OPEN BOTTOM, FLOATING TOP SPRING CUSHION CHAIR OR THE LIKE
Robert E. Eaton, Burlington, Iowa, assignor to Chittenden & Eastman Company, Burlington, Iowa, a corporation
Application April 27, 1935, Serial No. 18,524
7 Claims. (Cl. 155—179)



1. In a chair or the like structure including a peripheral frame of rails, in combination a spring unit including top border wire means, a plurality of cushion coils arranged in rows and in tandem relation in each row, a resilient bottom support structure for the coils suitably secured at opposite ends to a pair of opposed rails, said coils having their lower portions nested within the frame, said border wire means and top turns of the coils being operatively interconnected, and means independent of the bottom and connecting certain marginal coils to the frame to prevent undue swaying of the top of the unit, said means including a downwardly and frame directed metallic flexible connection from one turn of a coil toward the adjacent rail, and an upwardly and frame directed metallic flexible connection from a lower turn of the same coil toward the same rail, said metallic connections lying in substantially the same vertical plane, and another metallic flexible connection at one end connecting together the frame directed ends of the other metallic connections and connected at its opposite end to the said rail.

2,101,055
BRINE ICE
Crosby Field, Brooklyn, N. Y., assignor to Flakice Corporation, Brooklyn, N. Y., a corporation of Delaware
Original application August 14, 1931, Serial No. 557,108. Divided and this application April 24, 1935, Serial No. 18,050
2 Claims. (Cl. 62—1)

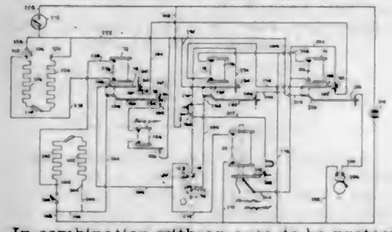


1. As a product of manufacture, a mass of dry brine ice in bulk form comprising relatively thin, at least partially pre-formed pieces having substantially the same salt concentration and each piece having the salt and water distributed substantially evenly throughout so that the product is substantially homogeneous, each piece also having two principal exposed surfaces, at least one of which surfaces has portions out of rectilinear alignment with other portions of the surface and materially less extensive side or edge portions adjoining said principal surfaces whereby the ratio of surface area to mass is increased to provide greater surface for heat transfer.

2,101,056
MEANS FOR COVERING CARGO HATCHES AND OTHER OPENINGS
Henry E. Frick, Upper Montclair, N. J., assignor to The Metal Lumber Corporation of New Jersey, New York, N. Y.
Application July 18, 1936, Serial No. 91,287
6 Claims. (Cl. 114—201)

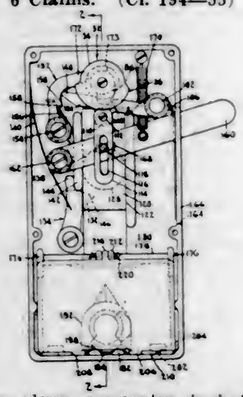
1. A plank for covering hatches and other openings consisting of an elongated casing formed of two thin metal sheets constituting two sections, a portion of one of which is inserted within the other, said casing having between and parallel with its narrower longitudinal sides U-shaped reinforcing partitions formed of one of said thin metal sheets and having abutting portions welded together, and continuous weld means uniting overlapping portions of said sections together thereby forming an enclosed casing.

2,101,057
MOTOR VEHICLE
Buckminster Fuller, Bridgeport, Conn., assignor to The Dymaxion Corporation, Bridgeport, Conn., a corporation of Connecticut
Application October 18, 1933, Serial No. 694,068
In Great Britain September 8, 1933
26 Claims. (Cl. 180—27)



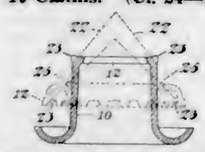
7. In a motor vehicle, a sub-frame supported at one end on the axle structure of two forward wheels and at the other on a single rear steering wheel, and adapted to maintain the steering axis rigidly in a plane having a fixed relation to the planes of the forward wheels, a main frame supported at its after end on said sub-frame and spring supported on said axle structure and extending forwardly thereof and of the sub-frame and a streamline body on and covering both frames and all the wheels, said frames having their longitudinal portions extending substantially at the same level.

14. An automobile comprising body, wheels and engine in the following form and relation viz., the body having the form of a unitary aeronautic streamline body with substantially unbroken external curvature from end to end, in plan and elevation, and its maximum cross section occurring at about one-third of the distance from the bow end; the engine being in the rearmost part of such body; the road wheels including front tractor and rear steering wheels all located within and laterally shielded from the external air flow by such body, the forward wheels being rearwardly spaced from the bow end to provide a substantial forward overhang of the body counterbalancing the engine weight so as to establish the center of



gravity of the unloaded vehicle at a point forward of the wheel base center; the passenger or load-receiving space within the body being forward of the engine and having a substantial part in advance of said forward wheels.

2,101,058
ALARM SYSTEM
Benjamin Goldstone, Long Beach, N. Y.
Application July 30, 1932, Serial No. 626,444
19 Claims. (Cl. 177—314)

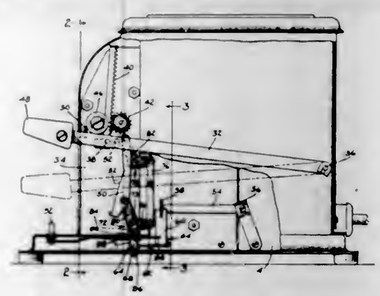


1. In combination with an area to be protected and having exits therefrom, means for guarding the exits against unwarranted passage therethrough, means for initiating an alarm upon attempting to effect passage past the guarding means, one of the exits having a door, means for locking the door against passage therethrough, said locking means, comprising means when actuated to locking position, for making the alarm-initiating means effective, circuit means for indicating the time when the door was locked and the alarm-initiating means made effective, and means to prevent the locking means from being operated through more than a single cycle from unlocked position to a position where it retains the door locked, and thereafter to a position where it is no longer effective to lock the door, whereby, in such cycle, the door may be retained locked for only a single continuous period.

2,101,059
ALARM APPARATUS
Benjamin Goldstone, Long Beach, N. Y.
Application July 24, 1933, Serial No. 681,847
6 Claims. (Cl. 194—55)

4. For an alarm apparatus including a protective circuit, an alarm-indicating device, and means for energizing the device including a circuit, means for controlling operation of the apparatus by closing or opening one of the circuits, the controlling means including an electric switch, means for moving the switch to make the apparatus operative, means for locking the switch-moving means against movement including an arm and means on the switch-moving means and the arm cooperating when the arm and switch-moving means are in a predetermined relation to each other to prevent actuation of the switch-moving means to circuit-closing position, a lug for engaging the arm to make the cooperating means on the switch-moving means and the arm inoperative for actuation-preventing purposes and to latch the arm in position to continue the cooperating means in inoperative condition, the switch-moving means, immediately that it is actuated after being unlatched, releasing the actuation-preventing means for actuation preventing purposes, a link carried by the arm, and means permitted limited reciprocating movement relative to, but beyond one limit of such movement engaging with, the link to move the arm out of cooperating relation to the switch-moving means and into engagement with the lug.

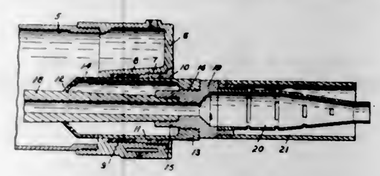
2,101,060
EYELET
Sylvester L. Gookin, Quincy, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application April 16, 1935, Serial No. 16,644
Renewed December 23, 1936
10 Claims. (Cl. 24—141)



1. An eyelet of ductile metal having a barrel provided with a blunt clenching end thicker in cross-section than any other portion of the barrel and including an internal unscored bead of supplemental metal the axial extent of which is so great in comparison with its extent of radial projection that when the pilot of a roll-clenching tool is inserted into the barrel the bead will not be bent back or folded by the operation thereon of such tool.

2,101,061
CASTING
Wallace E. Gordon, Wilmington, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application November 22, 1935, Serial No. 51,089
6 Claims. (Cl. 106—22)

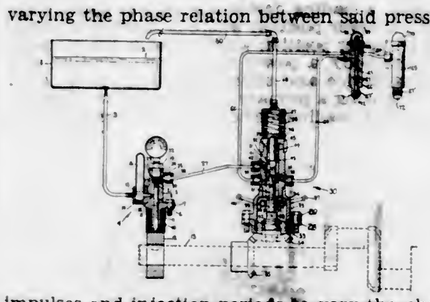
1. A flowable casting syrup comprising a preformed polymer from the group consisting of polymeric mono-methacrylic acid esters and polymeric mono-acrylic acid esters, dissolved in a monomer from the group consisting of monomeric methacrylic acid esters and monomeric acrylic acid esters, the proportion of polymer being at least 1% by weight of the syrup.



2,101,062
AUTOMATIC TOASTER
Maurice H. Graham, Minneapolis, Minn.
Application March 10, 1933, Serial No. 660,271
13 Claims. (Cl. 219—19)

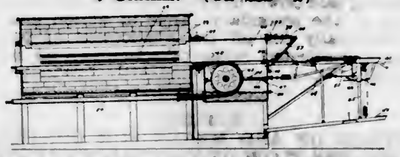
1. In a bread toaster having a toasting space for bread slices, means for initiating the toasting of a bread slice, a timing mechanism, means under the control of the timing mechanism for terminating the toasting of the bread slice, and thermostatic means responsive to toasting space con-

ditions for setting the timing mechanism upon initiation of the toasting interval to fix the duration thereof in accordance with initial toasting space temperatures.



2,101,063
MUZZLE ATTACHMENT FOR GUNS
Samuel G. Green, Gray, Ga.
Application October 16, 1936, Serial No. 105,951
3 Claims. (Cl. 89—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In combination with a jacket adapted to contain a fluid medium, a bearing at the end of the jacket, a gun barrel arranged to reciprocate within the jacket, a tubular adapter on the muzzle of the gun barrel and having an enlarged head spaced from the end of the gun barrel and capable of moving into the bearing, a sleeve attached to the adapter forwardly of the gun barrel and bearing against the head of the adapter, said sleeve slidably mounted in the bearing and having apertures for circulation of the fluid medium, and a device mounted on the head of the adapter for receiving the gases of explosion and having a diameter less than the bearing whereby it is capable of moving into the bearing.



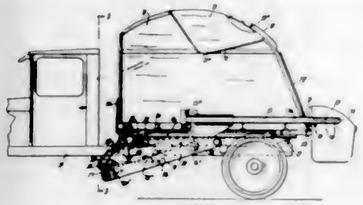
2,101,064
FUEL SYSTEM FOR INTERNAL COMBUSTION ENGINES
Richard W. Hautzenroeder, Mansfield, Ohio
Application September 26, 1933, Serial No. 691,040
24 Claims. (Cl. 123—139)

1. The method of injecting a fuel charge into the combustion chamber of a Diesel engine, which comprises subjecting an impounded quantity of fuel under pressure to intermittent pressure impulses, venting a quantity of such impounded fuel to the combustion chamber during injection periods which occur in predetermined timed relation to said pressure impulses, and varying the phase relation between said pressure

impulses and injection periods to vary the character of the injection.

2,101,065
HEAT TREATMENT FURNACE
Carl I. Hayes, Providence, R. I.
Application March 28, 1935, Serial No. 13,451
7 Claims. (Cl. 263—2)

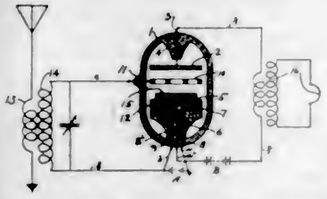
1. In a heat treatment furnace, a heat treatment chamber, a cooling chamber communicating therewith, means for enveloping work in said chambers in an atmosphere of inflammable gas, and means comprising igniting material positioned in the base of the cooling chamber and contacted by said atmosphere for preventing formation of an explosive mixture in said furnace.



2,101,066
NITROCELLULOSE EMULSION
Cleveland B. Hollabaugh, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application February 2, 1937, Serial No. 123,725
12 Claims. (Cl. 134—79)

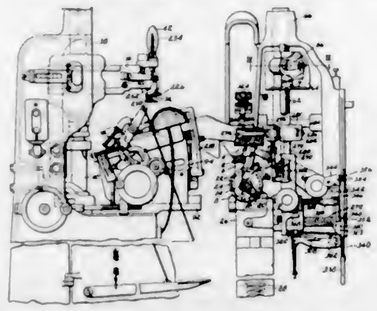
1. A nitrocellulose emulsion for the formation of a continuous, non-porous, adherent film on the surface of porous, absorbent material comprising a viscous, substantially water-immiscible solution of nitrocellulose emulsified in disperse phase in an aqueous solution of an emulsifying agent, the viscosity of the emulsified nitrocellulose solution being adjusted with respect to a given porous material by forming the solution with nitrocellulose of a viscosity characteristic and in amount with relation to the volatile content of the solution so that upon drying on the surface of the porous material a continuous film of nitrocellulose will be deposited upon the surface of the material without substantial penetration into the body thereof and the emulsion being stabilized by mechanical treatment, as by treatment with a colloid mill or homogenizer.

2,101,067
MATERIAL HANDLING APPARATUS
William S. Howard, Detroit, Mich., assignor to B. Nicoll & Company, Inc., New York, N. Y., a corporation of New York
Application October 22, 1935, Serial No. 46,068
7 Claims. (Cl. 214—77)



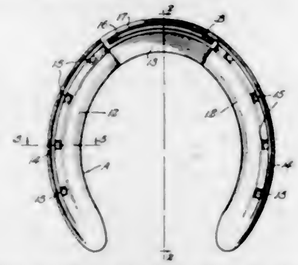
1. Apparatus for handling material comprising in combination, a chassis, a body tiltably mounted

thereon, a loading device mounted to operate between a lower position where it receives material and an upper position where it loads the material into the body, a power device for operating said loading device and tilting said body, said power device having a primary range of action for operating said loading device and a secondary and



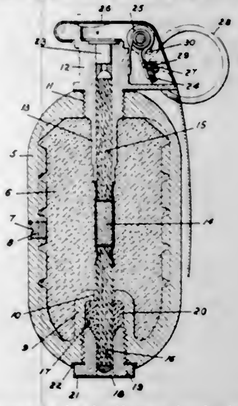
greater range of action including said primary range of action, and in the same direction, for raising said body, and means for selectively conditioning said power device to act through the primary or the secondary range of action and to automatically cut off the application of power when the selected range of action has been attained.

2,101,068
METHOD OF AND MEANS FOR CONTROLLING THE FLOW OF ELECTRIC CURRENT
Merion J. Huggins, Upper Saddle River, N. J.
Application July 12, 1935, Serial No. 30,963
5 Claims. (Cl. 250—27)



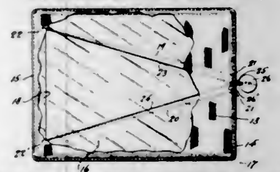
1. The method of controlling the transfer of electric energy through space, comprising providing an evacuated vessel having sealed therein oxygen gas and a plurality of electrically chargeable electrode elements including an oxidizable electrode element at which the gas is accumulated and electro-chemically effecting oxidization of said electrode and the composition of an oxygenic atomic conductor at the oxidizable electrode and another of said electrode elements co-operating with the oxidizable electrode element, initiating de-oxidization of the oxidizable electrode element and atomic conductor and emission of oxygen atoms therefrom by an electric charge on said oxidizable electrode element, effecting the emission of oxygen from and a degree of de-oxidization and electric conductivity of the atomic conductor and the discharge of a constant carrier current between said electrodes by said emitted atoms by an electric charge on the co-operating electrode element, and effecting an increase in the emission of oxygen atoms from and the de-oxidization and electric conductivity of the atomic conductor and electric energy discharge to vary the electric energy discharge between the oxidized and co-operating electrode elements by and conformably with an electric charge on a third of said electrode elements.

2,101,069
LASTING MACHINE
Bernhardt Jorgensen, Marblehead, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 18, 1936, Serial No. 116,589
34 Claims. (Cl. 12—12)



17. In a lasting machine, wiping means for wiping the marginal portion of an upper inwardly over a convex bottom face of a last, and means for effecting a predetermined amount of relative movement of said wiping means and the last heightwise of the last in automatically determined time relation to the wiping operation to maintain the pressure of the wiping means on the marginal portion of the upper substantially uniform during that operation.

2,101,070
HORSESHOE
Shawl J. Kelley, Baltimore, Md.
Application June 15, 1936, Serial No. 85,421
1 Claim. (Cl. 168—4)



A racing horse-shoe comprising a body member formed of light weight material shaped to fit the foot of the horse, said body member having a raised rim and side portions whose ground engaging faces are convex and slope gradually from the raised rim toward the interior, a built-up toe portion intermediate the side portions of substantially greater thickness than the side portions, and a steel insert at the rim of the toe portion forced into the body member while said body member is hot and plastic, said insert having a crimped root portion anchored within the metal of the body member the exposed portion of said insert being vertical on the inside and beveled on the outside, the bevel sloping from the tip of the insert toward the body member, said insert being of substantially the same length as the built-up toe portion of the body member, and being braced by the extra thickness of said built-up portion.

2,101,071
GRENADE
John M. King, Dover, N. J.
Application September 30, 1935, Serial No. 42,868
2 Claims. (Cl. 102—29)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

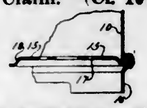
1. In a grenade including a body having coaxial apertures in opposite ends, a fuse unit comprising a fuse head mounted in one of the apertures and extending into the body, a tube on the inner end of the fuse head, a detonator in the tube, a first time fuse in the fuse head leading to the detonator, a second time fuse carried by the end of the tube and extending through the other aperture in the body, and a firing mechanism carried by the fuse head for igniting the first time fuse.

2,101,072
WAXING DEVICE
Russell B. Kingman, Orange, N. J.
Application January 21, 1937, Serial No. 121,393
10 Claims. (Cl. 91—54.7)

1. A pad having an expressible polishing content and a pervious facing member therefor through which said polishing agent may be gradually expressed by pressure and movement imparted to the pad in use, an impervious protective material initially disposed intermediate said polishing agent content and said facing member, and manipulatable means cooperative with said protective material operable to condition the same to permit communication of said polishing agent content to said facing member for exudation therethrough.

2,101,073
STRUCTURAL BUILDING ELEMENT AND BUILDING MADE THEREFROM
Guy F. Kotrbaty, New York, N. Y., assignor to Ferrocon Corporation, Bryn Mawr, Pa., a corporation of Delaware
Application December 20, 1934, Serial No. 758,345
29 Claims. (Cl. 72—1)

1. An improved wall and floor joint construction, including, in combination, vertical channel supporting members having locking flanges in mutually abutting engagement forming a composite structural member, and stirrup members



around the composite structure of the channel members and provided with lateral flanges respectively spaced from each other, and adapted to receive floor supporting members.

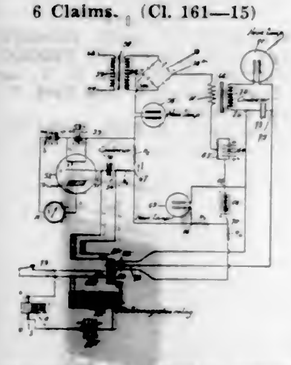
2,101,074
BUILDING SYSTEM AND CONSTRUCTION UNITS AND ELEMENTS THEREFOR
Guy F. Kotrbaty, New York, N. Y., assignor to Fer-O-Con Corporation, New York, N. Y., a corporation of Delaware
Application April 22, 1935, Serial No. 17,591
18 Claims. (Cl. 72—1)

1. A structural composite stud member comprising a two-part abutted and latticed channel construction, one side edge of each channel having unilateral mating sections including a channeled angular flange on one section and a straight, angular flange on the other sections fitting the channeled flange in a sliding fit, and movable laterally into operative position therein, bent-over key-receiving flanges on the other edges of the channels, and bi-laterally channeled keying means fitting over and engaging the said keying flanges in longitudinal sliding keying engagement.

2,101,075
FOOD DISPENSING DEVICE
Franz Kielsen Krag, Chicago, Ill.
Application June 3, 1935, Serial No. 24,679
1 Claim. (Cl. 107—52)

A dispensing device comprising a cylinder, a piston slidably mounted in the cylinder, a perforated disk removably mounted in the lower end of the cylinder, said disk having an annular flange extending angularly therefrom, the outer diameter of the flange being less than the diameter of

the bore of the cylinder, and a second annular flange extending outwardly from the outer edge of the former flange, and means for detachably clamping the second flange onto the end of the cylinder with the disk surface above or below the second flange as desired.



2,101,076

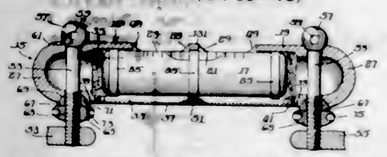
ELECTRIC TIME INDICATOR FOR SOUNDING APPARATUS

Louis Auguste Marie Joseph Laboureur, Paris, and Raymond Dubois, Asnieres, France

Original application May 11, 1932, Serial No. 610,676. Divided and this application August 7, 1933, Serial No. 684,110. In France May 20, 1931

6 Claims. (Cl. 161—15)

1. An electric time indicator comprising: a condenser, a triode lamp having a filament, a grid, and a plate, a source of plate tension, a source of filament tension, a condenser charging circuit comprising a resistance, a source of constant potential difference and the filament to grid space of the said triode lamp and including said condenser, said space functioning as a unilateral conductor permitting the charge of the condenser but preventing its discharge; means for starting the charging of the condenser, means for stopping said charging at the end of the phenomena to be measured, and means for measuring the variation in anodic current of the triode lamp under the action of the charge acquired by the condenser, from the variation of which the time is measured.



2,101,077

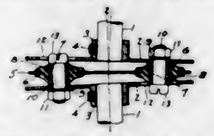
SPIRIT LEVEL AND MOUNTING

Adolph Langsner, Chicago, Ill., assignor to Eugene Dietzgen Company, Chicago, Ill., a corporation of Delaware

Application November 2, 1934, Serial No. 751,241

20 Claims. (Cl. 33—73)

1. A spirit level comprising a substantially cylindrical vial and a housing in which said vial is mounted, said housing comprising a cylindrical shell provided with spaced openings on one side and an elongated opening on the opposite side, and a removable cover for said elongated opening, said cover comprising a strip of less width than said elongated opening and secured at its opposite ends on said shell and having lateral ears extending to and engaging the opposite side edges of said elongated opening.



2,101,078

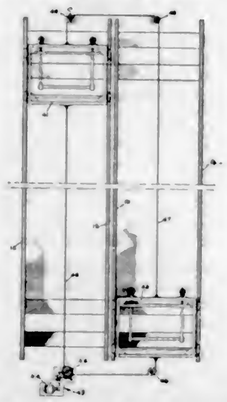
FLEXIBLE COUPLING

Hugh C. Lord and Thomas Lord, Erie Pa.; said Thomas Lord assignor to said Hugh C. Lord

Application July 10, 1935, Serial No. 30,653

12 Claims. (Cl. 64—13)

1. In a flexible coupling, the combination of two rotating members spaced axially, one of the members having a joint, comprising a plate with an opening therethrough offset from the axis of the coupling, and an element of resilient material overlapping the plate at the edges of the opening, and secured to the overlapping surface by a surface union, said element projecting into free space within the opening, and being secured at a point spaced from the edges of the opening to the companion member.



2,101,079

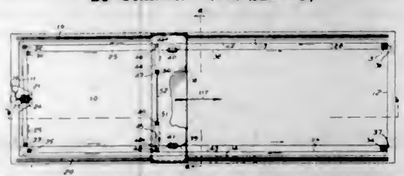
SEDIMENTATION APPARATUS

Nels B. Lund, Seaford, N. Y., assignor to The Dorr Company, Inc., New York, N. Y., a corporation of Delaware

Application October 3, 1934, Serial No. 746,676

15 Claims. (Cl. 210—55)

4. In a sediment collecting reciprocating mechanism for settling tanks, a frame depending into the tank and operable between angular positions in a manner to convey sediment along the tank bottom while travelling in the one direction and to run idle in the other direction, means for holding said frame inoperative during its idle travelling movement and swung out from the bottom in the direction of such movement, an obstruction in the path of the frame and adapted to engage directly upon the frame along the projecting portion thereof for resetting the same to operative position during the final phase of the carriage movement.



2,101,080

RAKING MECHANISM FOR SEDIMENTATION TANKS

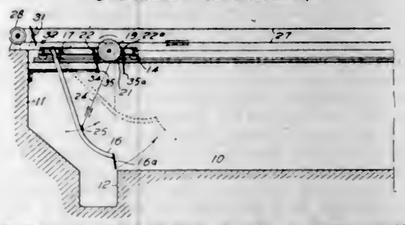
Nels B. Lund, Seaford, N. Y., assignor to The Dorr Company, Inc., New York, N. Y., a corporation of Delaware

Application January 4, 1935, Serial No. 356

10 Claims. (Cl. 210—3)

7. In combination with a rectangular settling tank having a sediment collecting element movable along a path parallel to two opposite walls of the tank and extending substantially transversely with respect to said path; propelling means for said sediment collecting element, including a rope portion operatively supported for driving one end of the sediment collecting element, a plurality of guide means for said rope portion and arranged with respect to the ends of the tank so that the rope portion is in the form of a loop, a part of which extends parallel to and along the length of the path of the sediment collecting element, said rope portion being attached to one end of said sediment collecting element and extending from that element along the path thereof to one of said guide means, thence back over at least another one of said guide means, thence to rotatable rope winding means and back to one end of said sediment collecting element by way of at least one of said guide means; and a second in effect substantially similar rope portion and a similar guide means for the other end of said sediment collecting element; and rotatable rope winding means having stationary mountings, so constructed and arranged as to drive both rope portions.

2,101,081



RAKING MECHANISM FOR SEDIMENTATION TANKS

Nels B. Lund, Seaford, N. Y., assignor to The Dorr Company, Inc., New York, N. Y., a corporation of Delaware

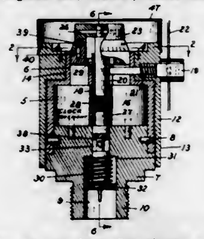
Application January 4, 1935, Serial No. 357

Renewed June 19, 1937

9 Claims. (Cl. 210—3)

1. In a sedimentation tank, a reciprocating sludge collecting and conveying mechanism which comprises a carriage; a sludge raking element depending from said carriage supported therefrom for operative and inoperative sludge rake positioning relative to the tank bottom, a reversible carriage-driving means including a linear flexible element for imparting driving pull to the carriage, mechanism associated with said flexible driving element and operable thereby upon the carriage for controlling the positioning of the sludge raking element, abutment means stationary relative to the carriage and control means upon the carriage responsive to said abutment means, said control means thereby, effective to operate the rake positioning mechanism through the driving pull of said flexible element substantially at a point where continued movement of the carriage is arrested.

2,101,082



FUSE

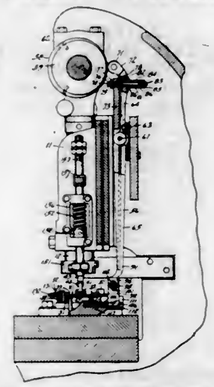
Marvin L. Mathsen, Wharton, N. J.

Application June 4, 1935, Serial No. 24,881

10 Claims. (Cl. 102—37)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a fuse, a casing having a neck and a centrally apertured base, an arming sleeve threaded on the outer side of the casing, vanes on the sleeve, a timing unit within the casing and having a rotatable tube extending into the neck of the casing and provided with a slot, a releasable bolt for holding the arming sleeve and tube against rotation, a striker including a locking ring slidably and non-rotatably mounted in the neck of the casing, a cap rotatably mounted on the locking ring, a firing pin fixed to the cap and extending through the timing unit and into the apertured base, a firing pin spring, spring-pressed bolts in the casing and retained by the arming sleeve in the path of the striker, a sleeve on the firing pin, a shear pin connecting the sleeve and firing pin, and a pin on the sleeve engaging the brim of the tube and adapted to enter the slot therein.

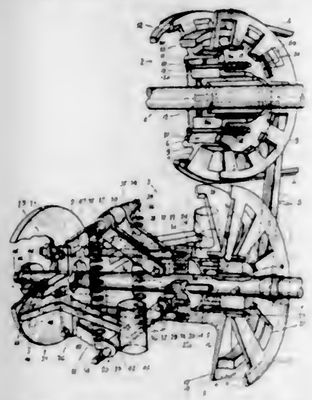


2,101,083

PRESS GAUGE

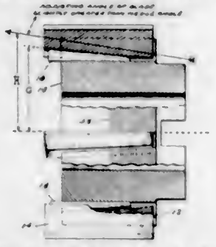
William J. Mercer, Berkeley, Calif., assignor to American Can Company, New York, N. Y., a corporation of New Jersey

Application February 25, 1936, Serial No. 65,728



7 Claims. (Cl. 164—59)

1. In a machine adapted to remove an inner



portion of a strip having a scroll edge which embodies adjacent recesses, the combination of die means for severing a portion from the strip which lies between adjacent recesses, and means operating on the sides of two adjacent recesses prior to said severing operation for gauging the strip relative to said die means.

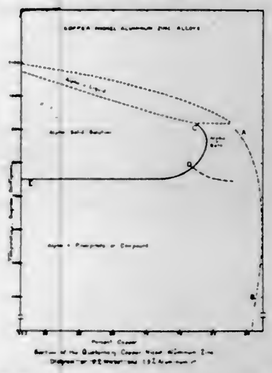
2,101,084
CONSTANT SPEED CONTROLLED DRIVE
Charles J. Meyers, Wilmar, Calif., assignor to William F. Hackett, Los Angeles, Calif.
Application August 11, 1934, Serial No. 739,430
25 Claims. (Cl. 74—230.17)

1. In a device of the kind described, a shaft, a pulley mounted on said shaft, said pulley being composed of parts one of which is rigidly mounted on said shaft and the other axially movable with relation thereto, a disc member loosely mounted on said shaft, a spider fixedly mounted on said shaft, means independent of one another connecting said disc member and said spider with the movable part of said pulley, the connecting means of the spider and movable pulley part comprising oppositely disposed sets of linkage, yieldable means connecting the joints of said linkage, and means initiated by centrifugal force fastened to said spider and acting against said disc member to expand the joints of said linkage in opposition to said yieldable means.

2,101,085
INSERTED BLADE CUTTER
Frank P. Miller, Meadville, Pa.
Application March 31, 1934, Serial No. 718,485
4 Claims. (Cl. 29—105)

1. In an inserted blade cutter, a carrier having a slot, a blade in said slot and having a cutting end portion, a wedge in said slot and disposed beneath and in lifting relation to the blade, said slot and said blade being formed with complemental side walls diverging in the direction of the cutting end portion of the blade and converging radially outward to define a blade adjusting line at an acute angle to the longitudinal axis of the body, said wedge being formed with a lifting angle less than the angle of the blade adjusting line with respect to the longitudinal axis of the body.

2,101,086
GUN
Wiley T. Moore, United States Army, Wright Field, Ohio
Application April 14, 1934, Serial No. 720,625
18 Claims. (Cl. 89—2)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

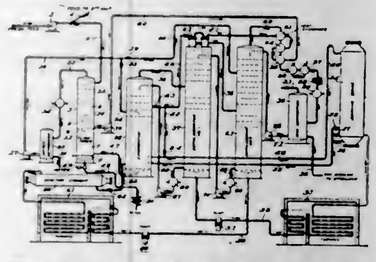


1. In a gun, a receiver having recesses with locking faces, a barrel attached to the receiver, a slide mounted for reciprocal movement in the receiver, a breech bolt disposed in the receiver and supported on the slide, said bolt having recesses at opposite sides adjacent its front end, a pair of locking levers carried by the bolt and each pivotally mounted at its front end for movement into and out of one of the recesses in the bolt and into one of the recesses in the receiver, each locking lever having an eccentric rear face engageable with the locking face of the receiver, a crank arm on each lever and having a cam slot, and a stud on the slide inserted in the cam slot of each crank arm.

5. In a gun, a receiver, a reciprocating breech bolt in the receiver, a sear carried by the bolt, a casing on the receiver, a plunger in the casing, an arm on the upper end of the plunger and having a cam face, a second arm on the upper end of the plunger and having rectangular faces, a compression and torsion spring normally depressing the plunger so that its lower end projects from the casing and the arms are out of the plane of the sear, means for restricting the plunger to a vertical movement when the arm with the cam face is positioned in the path of the sear, and means for restricting the plunger to a vertical movement and to a limited rotational movement when the second arm is positioned in the path of the sear, and means for elevating the plunger.

10. In a gun having a cartridge belt feed-way, a cover for the feed-way having a centrally located opening, a member on the upper side of the cover and having a lug extending through the opening and adapted to serve as a link-stripper, and a spring yieldingly holding said member in place.

16. In a gun, a receiver, a cover for the receiver having a longitudinally extending opening, a breech bolt reciprocally mounted in the receiver and having a rib on its upper side riding in the opening in the cover, a plate secured to the cover and having a channel for accommodating the rib on the breech bolt and means on said plate projecting through the cover and serving to eject a cartridge from the breech bolt upon recoil of said bolt.

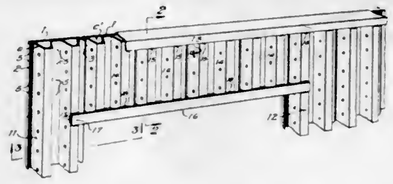


2,101,087
COPPER BASE ALLOY
Elmer L. Munson, Naugatuck, Conn., assignor to The American Brass Company, Waterbury, Conn., a corporation of Connecticut
Application February 18, 1937, Serial No. 126,389
10 Claims. (Cl. 75—155)

1. An alloy composed of copper, nickel, zinc and aluminum in proportions within the following ranges:

	Percent
Copper	66 to 95.5
Nickel	3 to 30
Aluminum	0.5 to 4
Zinc	1 to 30.5

2,101,088
TREATING HYDROCARBON OILS
Charles W. Nofsinger, Orange, and Percy C. Keith, Jr., Short Hills, N. J., assignors to Gasoline Products Company, Inc., Newark, N. J., a corporation of Delaware
Application December 1, 1931, Serial No. 578,374
7 Claims. (Cl. 196—48)

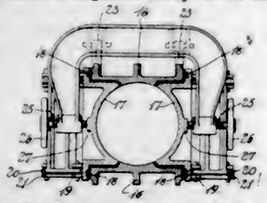


6. The process of treating hydrocarbon oil which comprises passing a clean distillate oil through a cracking zone wherein said oil is raised to a cracking temperature and subjected to conversion, introducing the resulting cracked products into a low point in an evaporating zone wherein vapors separate from liquid residue, passing resulting vapors upwardly through said evaporating zone and into a fractionating zone wherein fractional condensation thereof occurs, removing the fractionated vapors and condensing them as a desired product, utilizing resulting reflux condensate as a source of said clean distillate oil first mentioned, removing liquid residue from said evaporating zone and introducing it into a separate flashing zone wherein vaporization of lighter fractions thereof occurs, contacting fresh relatively heavy charging stock with resulting flashed vapors to cause partial vaporization thereof, collecting unvaporized portions of said fresh charging stock and condensed heavier fractions of the flashed vapors and introducing the resulting mixture, without intermediate passage through a cracking zone, into a higher point in said evaporating zone above the liquid level therein in countercurrent contact with the vapors rising therethrough so that said mixture is subjected to partial vaporization before any portion thereof contacts directly with the hot cracked products at the point of introduction thereof into said evaporating zone and at the same time introducing into said evaporating zone at a still higher point a lighter, relatively clean distillate oil, as a refluxing medium which serves to wash from the rising vapors undesirably heavy constituents.

2,101,089
LATEX STABILIZATION
Izador J. Novak, Bridgeport, Conn., assignor to Raybestos-Manhattan, Inc., Bridgeport, Conn., a corporation of New Jersey
No Drawing. Application November 21, 1934, Serial No. 754,124
10 Claims. (Cl. 18—50)

1. A liquid system for impregnating fibrous materials, comprising, rubber latex, a stabilizing agent for said latex including essentially an alkali metal salt of a polybasic weak acid, and an anti-foaming agent compatible with said system.

2,101,090
COMPOSITE GIRDER CONSTRUCTION
George Vincent Palmer, Los Angeles, Calif., assignor, by mesne assignments, to Roy Lacy, Los Angeles, Calif.
Application April 15, 1936, Serial No. 74,447
7 Claims. (Cl. 189—37)

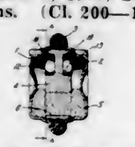


1. A composite girder which comprises a plurality of vertically extending sectional metal elements each provided with one or more vertically extending hollow cells and disposed in contiguous relationship to form a wall, a transverse compression member extending along one end of said elements and secured thereto, and a transverse tension member extending along the other end of said elements and secured thereto.

2,101,091
STONE BOX
Paul R. Parker, Brooklyn, N. Y., assignor to Bucyrus-Erie Company, South Milwaukee, Wis., a corporation of Delaware
Application July 23, 1936, Serial No. 92,059
3 Claims. (Cl. 302—64)

1. In a stone-box for the pipe line of a hydraulic dredge, the combination of: a section of cylindrical pipe; on each side thereof a door of substantially the height of the pipe, hinged to

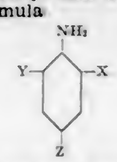
the pipe, and swingable away so as to completely



clear the door-opening; and unitary clamping means for the two doors.

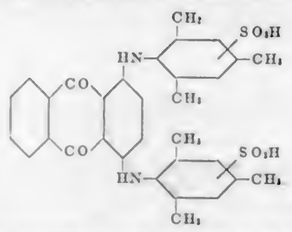
2,101,092
LIQUID CONTACT SWITCH
John H. Payne, Jr., Ballston Spa, N. Y., assignor to General Electric Company, a corporation of New York
Application December 28, 1934, Serial No. 759,527
5 Claims. (Cl. 200—152)

1. An electric switch comprising the combination of a plurality of dished metal members shaped to form an enclosure, an apertured partition of arc-resisting material interposed between said members and spacing them apart, a fillet of glass sealed to said members and to said partition at the peripheral edges thereof for hermetically sealing the enclosure formed by said members, and a body of liquid conducting material in said enclosure whereby electrical circuit between said members may be made and broken.



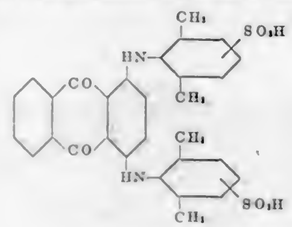
2,101,093
BARRIER FOR MERCURY SWITCHES
John H. Payne, Ballston Spa, N. Y., assignor to General Electric Company, a corporation of New York
Application November 1, 1935, Serial No. 47,801
5 Claims. (Cl. 200—152)

1. In an electrical switch containing a liquid contacting medium, a contact-governing barrier having an aperture therein adapted to be successively immersed in and withdrawn from said medium by rotation of said switch, said barrier being provided with a depression extending only partially therethrough and positioned to be immersed in said medium as said aperture is withdrawn therefrom.



2,101,094
ARYLAMINO ANTHRAQUINONE DYESTUFFS AND PROCESS FOR THEIR MANUFACTURE
Albin Peter, Basel, Switzerland, assignor to the firm Chemical Works formerly Sandoz, Basel, Switzerland
No Drawing. Original application March 13, 1935, Serial No. 10,938. Divided and this application December 28, 1936, Serial No. 117,973. In Germany March 21, 1934
8 Claims. (Cl. 260—60)

1. A process for the manufacture of anthraquinone dyestuffs, consisting in condensing anthraquinone derivatives containing in α-position two members of the group consisting of halogen and hydroxy with an aromatic amine of the general formula



wherein X stands for a member of the group consisting of methyl and ethyl, Y stands for a member of the group consisting of methyl, ethyl and halogen and Z stands for a member of the group consisting of hydrogen and methyl.

7. The anthraquinone dyestuff of the formula

8. The anthraquinone dyestuff of the formula

2,101,095
PROCESS OF MAKING ELECTRICAL HEATERS
George E. Price, Mansfield, Ohio, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 12, 1934, Serial No. 748,027
13 Claims. (Cl. 201—67)

1. The method of increasing the value of the electric-insulation characteristic of a layer of magnesium oxide located around a resistor and inside of an open ended metal casing which includes the steps of locating the assembly in a substantially vertical position in a heated solution of boric acid for a length of time of from one-half hour to six hours to cause the solution to circulate through the casing and deposit a coating of boric acid on the magnesium oxide and then subjecting the assembly to a temperature on the order of 600° F. to 900° F. for a length of time on the order of three hours.

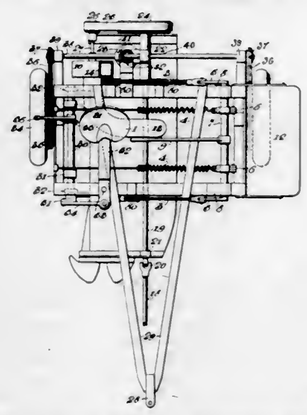
2,101,096
PRODUCTION OF MERCAPTANS
Raymond Reuter, Upper Aetna Lake, Medford Lakes, N. J., and Frank L. Gaus, Philadelphia, Pa., assignors to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Application February 15, 1935, Serial No. 6,652
8 Claims. (Cl. 260—156)

1. A process for producing mercaptans having a lesser number of carbon atoms to the molecule than the olefine hydrocarbons from which they are produced, which comprises reacting a branched-chain olefine hydrocarbon polymer with hydrogen sulfide at a temperature of from about 100° C. to about 300° C., and under superatmospheric pressure, in the presence of a catalyst for promoting depolymerization of the olefine hydrocarbon polymer and reaction thereof with hydrogen sulfide.

2,101,097
PRODUCTS FOR RENDERING THE URINE BACTERIOSTATIC
Theodore H. Rider, Mariemont, and Robert Shelton and John Haynes, Cincinnati, Ohio, assignors to The Wm. S. Merrell Company, Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application July 26, 1934, Serial No. 737,102
8 Claims. (Cl. 167—65)

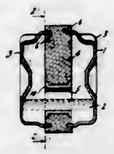
1. A therapeutic agent for oral administration for rendering the urine bacteriostatic comprising the esters of those simple organic acids selected from the group consisting of aceto acetic acid, hydroxy-butyric acid, butyric acid, phenol butyric acid, valeric acid, iso-valeric acid and crotonic acid, the administration of which acids is known to cause the excretion of acetone bodies in the urine when administered as acids.

2,101,098
METHOD OF MAKING ELECTRIC HEATING UNITS AND RESULTANT PRODUCT
William J. Russell, Mansfield, Ohio, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 12, 1934, Serial No. 748,024
9 Claims. (Cl. 219—37)



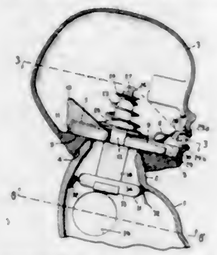
1. The method of making an enclosed electric heating unit embodying similarly grooved metal plates which includes the steps of locating a resistor in the grooves, disposing the plates in face-to-face position, locating a yieldable gasket between the outer peripheral portions of the plates, securing the plates together at a plurality of spaced points within the periphery of the plates and sealing said peripheral portions by lapping one over the other to tightly compress the gasket between them.

2,101,099
MANGANESE COMPOUNDS OF NUCLEOTIDES AND OF THEIR HYDROLYTIC DECOMPOSITION PRODUCTS
Simon L. Ruskin, New York, N. Y., assignor to Frances R. Ruskin, New York, N. Y.
No Drawing. Application December 27, 1932, Serial No. 648,993
8 Claims. (Cl. 167—68)



1. The combination of manganese and an isolated mononucleotide.

2,101,100
COTTON PICKING MACHINE
John D. Rust and Mack D. Rust, Memphis, Tenn.
Application October 16, 1935, Serial No. 45,337
20 Claims. (Cl. 56—14)



1. In a cotton picking machine, an endless-chain-carried set of spindle-carrying slats whose spindles are arranged in a plurality of horizontal rows, a tunnel through which the spindles are carried to gather cotton, and a combined shock-absorbing and spindle-surface-conditioning means located adjacent the entrance of the tunnel.

2,101,101
LIQUID CONTACT CIRCUIT CLOSER
Robert F. Sambleson, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York
Application January 14, 1937, Serial No. 120,546
6 Claims. (Cl. 200—152)

1. In a liquid contact circuit closer, an envelope containing a quantity of mercury, the major portion of said envelope comprising opposed metal terminals, a diaphragm of glass therebetween having a glass-to-metal seal with the edges of said terminals for completing the enclosure of the envelope, said diaphragm being adapted to separate the mercury into two pools in one position of the circuit closer whereby the circuit between the terminals is interrupted and having an opening therein arranged to be submerged in the mercury in another position of the circuit closer whereby the circuit between the terminals is completed through the mercury, said opening being arranged so that the circuit between the terminals is completed and interrupted in the mercury within said opening as the circuit closer is moved between said positions, and a lining for the opening of insulating material resistant to wear under the influence of an electric arc.

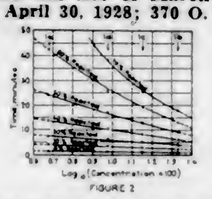
2,101,102
DOLL
Edward G. Schaeffer, New York, N. Y., assignor to Cecilia E. Bowers, Washington, D. C.
Application July 9, 1935, Serial No. 30,553
16 Claims. (Cl. 46—135)

1. A doll including a torso, a hollow head movably mounted on the torso and provided with a face having an elastic portion surrounding the mouth, mechanism for varying the facial expression of the doll including movable members cooperable with said elastic portion, and means controlled by relative movement of the head and torso for actuating said movable members.

2,101,103
METHOD OF TREATING MILK
Edward W. Smith, Melrose, Mass., assignor to Submarine Signal Company, Boston, Mass., a corporation of Maine
No Drawing. Application March 17, 1936, Serial No. 69,365
8 Claims. (Cl. 99—54)

8. Method of treating whole milk which comprises separating most of the cream from the milk, passing the separated milk containing a very small quantity of cream through a pressure homogenizer adjusted to produce a sufficiently fine dispersion of the cream in the milk to preclude substantial subsequent separation and thereby reduce the curd tension of the milk and passing the milk so treated together with the initially separated cream through the pressure homogenizer adjusted to disperse the cream in sufficiently large particles to permit subsequent separation thereof from the milk.

2,101,104
CATALYST FOR HYDROGENATING HYDROCARBONS
Harold M. Smith and Harry T. Rall, Bartlesville, Okla.
Application April 26, 1934, Serial No. 722,518
11 Claims. (Cl. 260—168)
(Granted under the Act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



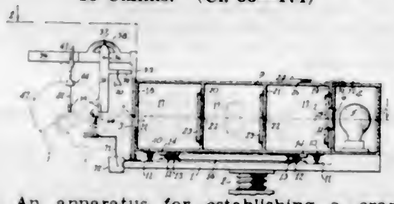


FIGURE 2

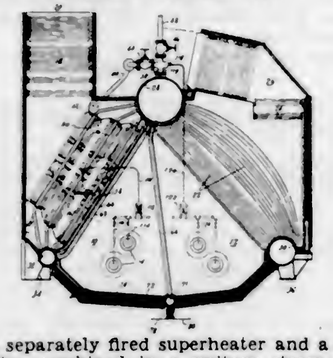
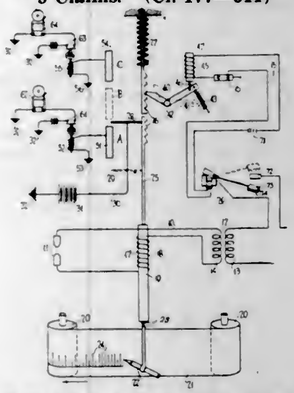


1. A method for effecting controlled hydrogenation in a continuous flow process wherein hydrogen evolved concurrently with a mixture of hydrocarbons, containing a polynuclear aromatic is caused to react with and to effect a controlled saturation of the aromatic and which consists in contacting the reactants with a hydrogenating catalyst for a time interval, which at a constant hydrogen pressure within the pressure range of 10 to 60 cm. of mercury and at a temperature within the temperature range of 95° to 200° C. is determined as being a function of the concentration of the catalyst for the amount of reaction desired.

2,101,105
APPARATUS FOR ESTABLISHING A STANDARD CRANIAL POINT OF ORIENTATION
Edgar W. Snell, San Francisco, Calif.
Application November 17, 1933, Serial No. 698,529
13 Claims. (Cl. 33—174)

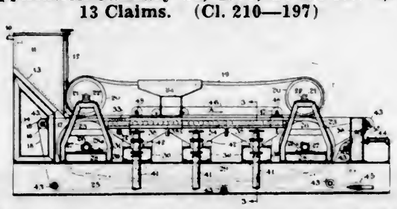
1. An apparatus for establishing a cranial point of orientation comprising a platform, means for raising and lowering the same, a mirror arranged vertically on the platform and having a horizontal slot therein, a light chamber rearwardly of the mirror and spaced therefrom and having a light opening toward the mirror, and a box interposed between the mirror and the light chamber and having slots in horizontal alinement with the slot of the mirror.

2,101,106
SUPERHEATER BOILER
Thomas B. Stillman, South Orange, N. J., assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey
Application July 12, 1935, Serial No. 30,950
7 Claims. (Cl. 122—473)



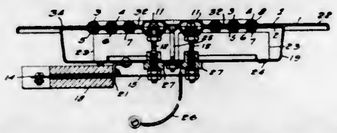
1. A separately fired superheater and a steam generator combined in a unitary steam power installation from which wholly saturated steam or wholly superheated steam may be optionally supplied, means forming a steam and water chamber which acts as a separator, means forming two independently operable furnaces with separate gas outlets on opposite sides of the separator, means forming submerged water chambers below the separator and on opposite sides thereof, inclined steam generating tubes arranged in opposite banks each of which directly connects one of said water chambers to the separator, the tubes of each bank being respectively wholly disposed over one of said furnaces, upright tubes disposed between said furnaces and connected to said separator, means connecting said upright tubes into the boiler circulation, refractory means supported by the upright tubes and closing the inter-tube spaces to complete a fluid cooled wall separating the furnaces, a superheater disposed wholly over one of said furnaces, and means for optionally discharging steam from said separator through said superheater or direct to use.

2,101,107
MOLDING COMPOSITIONS AND PROCESS OF MOLDING
Daniel E. Strain, Wilmington, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 26, 1935 Serial No. 18,391
16 Claims. (Cl. 18—55)



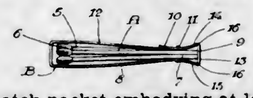
1. Process of molding methacrylic acid esters which comprises intimately admixing a polymeric mono-methacrylic acid ester with a monomeric poly-methacrylic acid ester and molding the resulting composition under pressure and at a temperature of not less than about 80° C. whereby said monomeric poly-methacrylic acid ester is substantially polymerized.

2,101,108
WELD EFFICIENCY INDICATOR
John P. Tarbox, Philadelphia, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application May 13, 1932, Serial No. 611,223
5 Claims. (Cl. 177—311)



4. In a weld energy consumption indicator the combination of a spot welding circuit, a control circuit operable upon energization to supply a welding impulse to the welding circuit, a solenoid connected with said welding circuit and having an armature responsive in the extent of its movement to the product of a function of the current flowing therein multiplied by the time of flow, means for retaining said armature in actuated position, means selectively responsive to successive degrees of movement of said armature for indicating different current-time products, and means operable upon de-energization of the control circuit to release said retaining means.

2,101,109
METHOD OF AND APPARATUS FOR THE EXTRACTION OF LIQUID FROM MATERIALS
William R. Thomson, Toronto, Ontario, Canada
Application January 23, 1935, Serial No. 2,977
13 Claims. (Cl. 210—197)



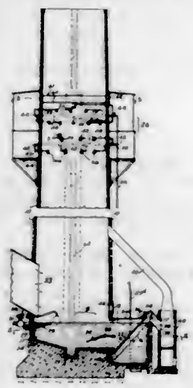
1. In apparatus of the character described, the combination of a stationary suction member provided with a suction port, an endless flexible suction mat provided on one surface with a drainage groove, a soft non-metallic filter web supported on said mat, means integral with said mat maintaining said filter web in slightly spaced relation to the body of said mat, and passages in said mat respectively leading from said groove to spaced openings on the body of said mat and providing communication between said groove and the suction port in said stationary member.

2,101,110
HEATING UNIT
Frank Thornton, Jr., Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application July 1, 1932, Serial No. 620,402
6 Claims. (Cl. 219—37)

1. In an electric heating device for operation in air at red heat, a resistance heater comprising a helically wound resistor conductor and a body of homogeneous, thermally-conductive, compressed, electrically-insulating material surrounding said conductor over its entire length and surface and substantially plane sheet metal members formed to enclose said heater and closely contact with said insulating material, said sheet metal members being united to hermetically seal said heater.

2,101,111
MATCH PACKET
Henry C. Traute, Monmouth Beach, N. J., assignor to The Diamond Match Company, Wilmington, Del., a corporation of Delaware
Application December 11, 1936, Serial No. 115,291
4 Claims. (Cl. 206—29)

1. A match packet embodying at least one card or comb of matches provided with a flexible cover comprising a body having a fold which overlies the proximate face of the butt portion of the card or comb, and a rectangular end portion providing a flat friction bearing surface of substantial



width connecting said body and fold, said end portion being exteriorly coated with ignition material and extended laterally beyond and medially supported longitudinally of the opposing free edge of the said butt portion, and means closely uniting the said fold, butt portion and cover, said means being spaced from the free edge of the butt portion, and the parts of the fold and cover body adjacent the rectangular end portion of the cover diverging from said butt portion to the respective longitudinal edges of said end portion and serving as lateral braces therefor.

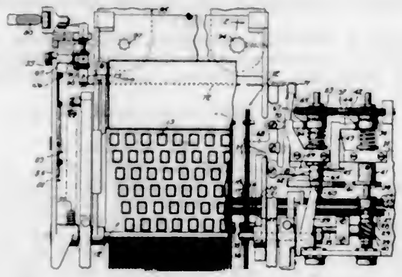
2,101,112

APPARATUS FOR THE UTILIZATION OF THE HEAT OF FLUE GASES OF A FURNACE TO HEAT A LIQUID

Edward Henry Vicary, Port Angeles, Wash., assignor to Rainier Pulp & Paper Company, San Francisco, Calif., a corporation of Delaware

Application October 19, 1934, Serial No. 749,130
6 Claims. (Cl. 159—16)

5. In a device for the utilization of the heat of flue gases to heat a liquid, the combination of a stack and a spray means disposed in said stack, said spray means comprising a plurality of downwardly directed nozzles, each of which is adapted to spray liquid over a circular area, a part of which nozzles are disposed in a circle, a part in another circle concentric with and of less diameter than said first mentioned circle and the spray area of the nozzles in one circle overlapping with the spray area of the nozzles in the other circle, another part of said nozzles disposed in like concentric circles but substantially superimposed above said first mentioned circles, and said last mentioned nozzles being disposed in off-set relation with respect to the nozzles of said first mentioned circles.



6. A device for the utilization of the heat of flue gases to heat a liquid embodying a stack; a flue conducting heated gases to the bottom portion of said stack and upon the surface of the liquid; and a reservoir containing liquids to be heated located in the bottom portion of said stack and positioned to have the surface portion thereof swept by flue gases, said reservoir comprising a portion in which the surface of the liquid to be heated is relatively disturbed by said heated gases and a pocket in which the surface of the liquid to be heated is relatively undisturbed by said heated gases and into which said flue gases floatingly urge the surface portion of the liquid, the surface of the liquid in said pocket and said portion being continuous whereby bodies of matter may be floatingly passed from the disturbed portion of the liquid to said pocket.

2,101,113

CONTROL UNIT FOR LINE CASTING MACHINES

Lester M. Walden, Chicago, Ill., assignor, by mesne assignments, to Teletypesetter Corporation, a corporation of Delaware

Application February 16, 1933, Serial No. 656,984
19 Claims. (Cl. 199—18)

1. In a line composing machine, an automatic control unit, an elevator for raising assembled matrices initiated by said unit, means for arresting the operation of said unit during the transit of said elevator and until it returns to a normal position, and means for permitting a partial return only of said elevator and for thereby preventing the resumption of operation of said unit in the event of an unsuccessful attempt at operation of said elevator.

2,101,114

FLUID FLOW ELECTRIC SWITCH AND METHOD OF AND APPARATUS FOR MANUFACTURE OF SAME

Warren R. Walker, Short Hills, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey

Application June 26, 1935, Serial No. 28,560
12 Claims. (Cl. 200—152)

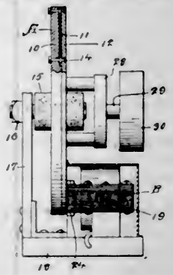
1. An electric switch comprising the combination of an apertured disc, a pair of metallic members whose rims are shaped to closely fit the edges of said disc for an appreciable distance without making contact with each other, a thin coating of thermoplastic insulating material between the overlapping portions of said disc and each of said metallic members, whereby the foregoing elements comprise a hermetically sealed envelope having two chambers connected by the aperture in said disc, said thermoplastic material having a composition which is workable to hermetically seal said envelope at a low temperature, and mercury within said envelope to connect said metallic members through said aperture in one position of said switch.

2,101,115

ELECTRIC SWITCH OF THE FLUID FLOW TYPE

Warren R. Walker, Short Hills, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey

Application October 29, 1935, Serial No. 47,299
6 Claims. Cl. (200—152)



1. An electric switch comprising, in combination, a pair of metallic members hermetically sealed together to form a substantially all metal envelope, said members being insulated from each other, mercury within said envelope in contact with said metallic members over an extensive area, said envelope having a relatively high contact resistance with said mercury despite said large contact area, a refractory member dividing said envelope into two chambers, said refractory member having an opening therein to permit mercury flow therethrough in the closed circuit position of said switch to electrically connect said metallic members, and a coating of platinum of relatively small area in electrical contact with each of said metallic members and with said mercury when said switch is in said closed circuit position to reduce the electrical resistance between said members and said mercury.

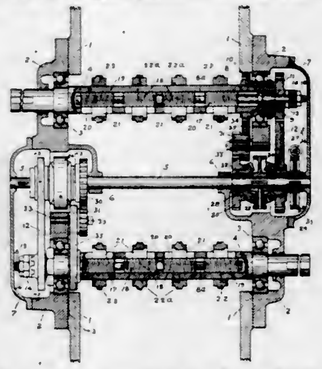
2,101,116

ELECTRIC MOTOR

Paul Warnick and Walter H. Scott, Chicago, Ill., assignors to John L. Berggren, Chicago, Ill.

Application June 24, 1935, Serial No. 28,192
6 Claims. (Cl. 172—278)

1. An electric motor comprising a stator having successive poles increasingly lagged, and a rotor having a part of its area continuously exposed to the inductive action of the stator poles, the rotor comprising a duality of flat metal elements of which one is magnetic and the other non-magnetic, the magnetic element being of a high degree of magnetic retentivity.



2,101,117

MECHANICAL CONTROL DEVICE

Milton T. Weston, Keansburg, N. J.

Application May 25, 1936, Serial No. 81,597
6 Claims. (Cl. 74—393)

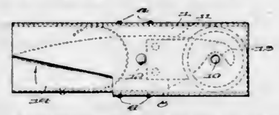
1. In a mechanism of the character described the combination with revolvable parallel tubular shafts one of which may be driven from the other, of co-acting control shafts mounted interior to said tubular shafts and normally revolving therewith but capable of independent rotation therein, and positive means for rotating said co-acting control shafts independently of said tubular shafts at the same or at different rotational speeds at will.

2,101,118

ALUMINUM ALLOY

Henry L. Whitman, Los Angeles, Calif.

No Drawing. Application August 26, 1936, Serial No. 98,076
2 Claims. (Cl. 75—140)



2. An aluminum alloy consisting of from 85% to 90% aluminum, from 4% to 6% of copper, from 2% to 3% of tin, from ½% to 1% of nickel, from ½% to 1% of magnesium, from 1% to 2% of manganese, from ¼% to ½% of silver, the quantity being alloyed together to produce a complete product by fushion at high temperature.

2,101,119

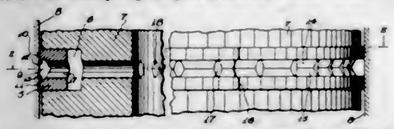
IMPRESSION SEAL

Thomas B. Wilder, Aberdeen, N. C.

Application April 22, 1936, Serial No. 75,823
8 Claims. (Cl. 101—3)

1. In an impression seal, the combination of an impression die movable toward and from the cooperating surface and having a rounded projection thereon, a cam member arranged for wedging movement in a plane extending transversely of the direction of movement of the die for engaging said rounded projection to move the die, and means for operating said cam member.

2,101,120



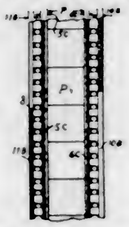
PISTON RING

Frederick W. Wilkening, Narberth, Pa., assignor to Wilkening Manufacturing Company, Philadelphia, Pa., a corporation of Delaware

Application January 12, 1933, Serial No. 651,327
Renewed December 12, 1935
3 Claims. (Cl. 309—45)

1. A piston ring comprising a generally annular body interrupted at one point to permit radial expansion thereof, a pair of opposed and substantially equal and spaced cylindrical cylinder-contact surfaces along the outer periphery of the

piston ring, a generally annular outer groove intermediate said two cylindrical cylinder-contact surfaces of a maximum radial depth not substantially greater than one-half of the overall radial thickness of the cross section of the ring, and having outwardly converging conical walls forming with said cylindrical cylinder-contact surfaces opposed and generally equal acute oil-scooping edges spaced from each other



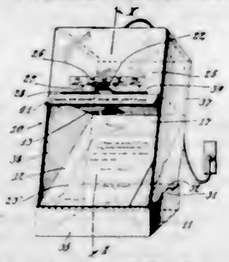
at a distance substantially greater than the axial width of each of said two cylindrical cylinder-contact surfaces and more or less the same as the combined axial widths of the same, and a series of circumferentially distributed generally radial apertures extending through the piston ring from said annular groove to the inner periphery thereof generally in the median plane of the ring at a right angle to the axis thereof.

2,101,121

SOUND RECORDING AND REPRODUCING EQUIPMENT

Howard H. Wixon, Chicago, Ill.

Application May 3, 1929, Serial No. 360,252
16 Claims. (Cl. 179—100.3)



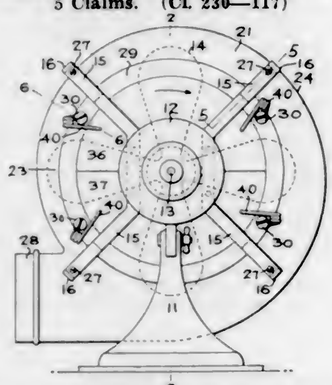
1. A sound film having a multiple sound track recorded thereon, and a switch track also having a switching signal recorded thereon for the purpose of controlling the recorded sounds in relative reproduction upon separate speakers as described.

2,101,122

LIGHT INTENSITY INDICATOR

Cornelius S. Woodside, Verona, N. J., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application March 8, 1935, Serial No. 9,991
5 Claims. (Cl. 35—19)



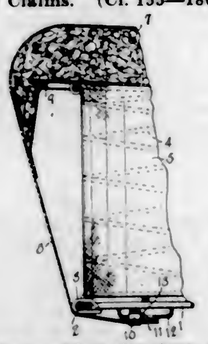
1. A light intensity indicator comprising a housing having an upper chamber with a closed front wall, a lower chamber with a large front opening, a light source in said upper chamber, a member in said lower chamber adapted to receive light from said upper chamber and support a seeing task for inspection through said opening, means between said chambers and movable intermediate said light source and surface for varying the intensity of light illuminating said surface, and means indicating the degree of intensity of light falling on said surface or seeing task in terms of lamp wattage.

2,101,123

BLOWER

Christopher L. Wyche, York, Pa.

Application December 29, 1936, Serial No. 118,629
5 Claims. (Cl. 230—117)



1. An apparatus of the class described, comprising a rotatable fan, an electric motor for operating said fan, a spiral casing enclosing said fan and having an inlet opening adjacent one end of the motor and an outlet opening, a plurality of arms carried by the motor and projecting outwardly therefrom, means for detachably connecting the extremities of said arms with said casing whereby the casing is supported solely by said motor, a ring detachably mounted in said inlet opening of the casing, and a plurality of disks detachably carried by said ring for varying the area of said inlet opening.

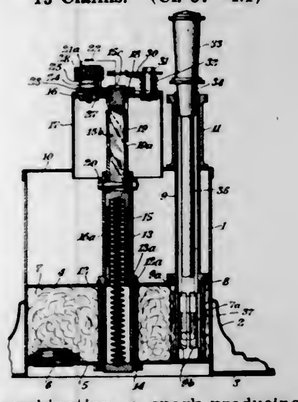
2,101,124

SPRING STRUCTURE

Leonard A. Young, Detroit, Mich.

Application December 13, 1935, Serial No. 55,805
10 Claims. (Cl. 155—180)

1. In a spring cushion structure, the combination with a spring supporting base comprising a



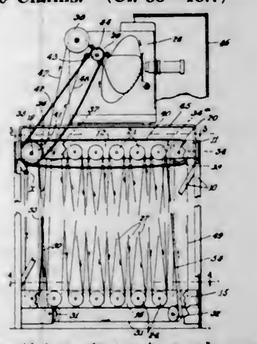
border frame, of body springs assembled on said base, upholstery supported by said springs and provided with a depending skirt having T-studs secured at the edges thereof, the skirt being drawn around the base border frame, and an upholstery attaching frame of channel section disposed on the under side of said base within the border frame and facing upwardly, said upholstery attaching frame having key-hole slots therein disposed with their reduced portions outwardly and receiving said studs, portions of the edges of the slots being struck inwardly to provide detents for said studs.

2,101,125

FLAME PRODUCING MECHANISM

Louis V. Aronson, Newark, N. J., assignor to Art Metal Works, Inc., a corporation of New Jersey

Application October 25, 1934, Serial No. 749,903
15 Claims. (Cl. 67—4.1)



9. In combination, a spark-producing device, means for guiding said device along a path, and means for operating said device to produce sparks during movement thereof along said path, said operating means comprising a torch member partaking of movement with said device, said torch member, during operation of said device, being positioned in the path of the sparks.

2,101,126

ADVERTISING CINEMATOGRAPH

George H. Babb, Brooklyn, N. Y.

Application November 17, 1936, Serial No. 111,209
9 Claims. (Cl. 88—18.7)

1. An advertising cinematograph consisting in the combination with a projector having a film feeding mechanism, of a magazine embodying therein a plurality of closely adjacent upper rows of guides, film feeding means including sprocket wheels at the opposite ends of adjacent rows of guides, a plurality of closely adjacent lower rows of guides spaced vertically from said upper rows of guides, means upon the opposite sides of the guides of each row spacing the guides of one row from those of another row and controlling the run of the film about the guides of each row, and cross-over rollers parallel with each other and having axes oblique to the axes of said guides, whereby an endless film, after passing about guides in said rows, is transferred from a guide on one side of the magazine to a guide at the opposite side thereof, means entraining the film feeding mechanism of said projector and the film feeding means of said magazine, and a guide roller upon said projector adjacent said film feeding mechanism.

2,101,127

MAGAZINE AND FILTER CIGARETTE HOLDER

Paul F. Bruins, Jamaica, N. Y.

Application November 19, 1935, Serial No. 50,515
2 Claims. (Cl. 131—10)

1. A magazine and filter cigarette holder comprising a primary tubular member provided with a mouthpiece and adapted to enclose a cigarette, said member having catch means at its end opposite the mouthpiece and a short non-combustible tube having complementary catch means, said tube being adapted to simultaneously hold two oppositely projected cigarettes, one within the primary tubular member, and one exposed and projected forwardly thereof, and the two being adapted for support by the primary tubular member in either one of two positions, one reversed to the other.

2,101,128

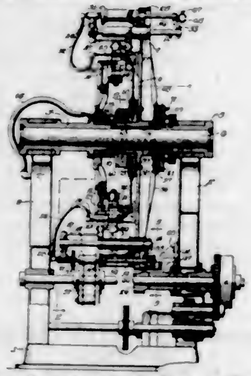
COMPOSITE ARTICLE

Charles A. Cabell, Washington, D. C., assignor to Economy Fuse & Manufacturing Company, Chicago, Ill., a corporation of New York

No Drawing. Application September 30, 1935, Serial No. 42,886
4 Claims. (Cl. 49—92)

1. A transparent article of commerce in the form of a tube, or the like, comprising a homogeneous mass of predetermined thickness composed of laminations of transparent cellulosic sheet material tightly adhered and contracted on a base of glass.

2,101,129



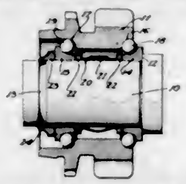
CAN TESTER

Allan M. Cameron, Oak Park, Ill., assignor to Cameron Can Machinery Co., Chicago, Ill., a corporation of Illinois

Application February 24, 1936, Serial No. 65,335
5 Claims. (Cl. 73—51)

1. In a can testing machine, the combination of a testing wheel carrying a plurality of testing receptacles, a delivery wheel provided with a plurality of pockets for receiving cans from said wheel, a defective can chute and a good can chute associated with said delivery wheel, means

including can engaging fingers carried by said delivery wheel for mechanically gripping defective cans to carry them past the good can chute to the defective can chute, and means controlled by the tested cans for actuating said fingers, said



last mentioned means including a dog movable with each finger, a spring pressed lock pin controlling the position of each dog and finger and having a recess for the reception of said dog and means for actuating said pin relatively to said dog.

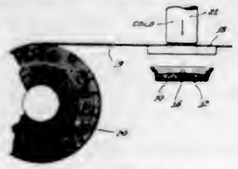
2,101,130

MOTOR VEHICLE

John M. Christman, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application June 29, 1935, Serial No. 29,167
16 Claims. (Cl. 29—84)

1. The method of assembling a pair of ball bearings in connection with a support in which the bearings are separated by a deformable separator comprising pressing one bearing towards the other to a degree causing deformation of the spacing means beyond its elastic limit and continuing the pressure until the balls of the bearings are under appreciable load, and then securing the bearings to the support with the balls thereof preloaded and with the spacer in its deformed condition.



2,101,131

METHOD OF MAKING CENTER SPOT CROWNS

Benno Cohn, Brooklyn, N. Y., assignor to Ferdinand Gutmann & Co., Brooklyn, N. Y., a corporation of New York

Application August 21, 1936, Serial No. 97,094
5 Claims. (Cl. 113—80)

1. A method of making center spot crowns embodying therein the coating of a colloidal solution of albumen upon the exposed face of the cushion disc of a crown, removing a portion of the vehicle of said solution and making it tacky by subjecting it to heat, cutting a center spot disc from an uncoated strip of facing material and forcing it into contact with said coating while it is still tacky, and thereafter subjecting

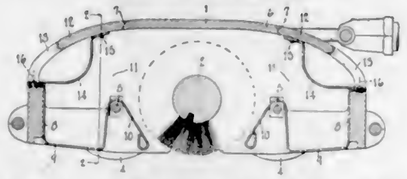
said center spot to a continuing pressure and to heat to bring said coating to a temperature which will coagulate the albumen.

2,101,132

DEVICE FOR APPLYING MASCARA AND SIMILAR MATERIALS

Lewis Daly and Margaret Johannsen, New York, N. Y.

Application November 9, 1935, Serial No. 48,990
17 Claims. (Cl. 132—1)



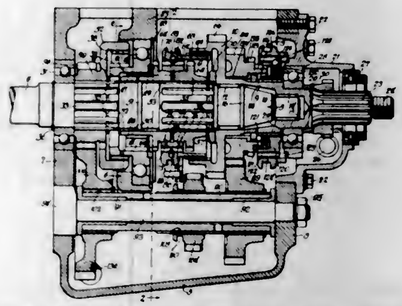
1. An elongated, thin-walled container for plastic materials which has a relatively small area of its walls adjacent one end cut away at a plurality of points and the intervening portions creased to form a plurality of equally spaced apart, substantially V-shaped, outwardly projecting portions together constituting a comblike row of teeth with openings through some portions of each of the oppositely disposed faces thereof communicating with said container's interior; whereby a comblike structure with attached reservoir is produced, the interior of which reservoir is in communication with each space lying between any two adjacent teeth of the comb.

2,101,133

CARPET SWEEPER CASE AND DUSTPAN CONSTRUCTION

Herbert C. Dilliard, East Bangor, Pa., assignor to Bissell Carpet Sweeper Company, Grand Rapids, Mich.

Application April 6, 1936, Serial No. 72,870
2 Claims. (Cl. 15—41)



1. In a carpet sweeper having a casing, an elongated rotary brush therein, and floor wheels with an axle extending through the casing, the combination of a removable dust pan disposed parallel with said brush, a guide extending upwardly from adjacent said brush over said axle and to said pan, said pan having an opening to receive sweepings passing over said guide from said brush, the top of said casing having an opening for the removal of said dust pan and said dust pan having a top closing said opening and forming a portion of the top of the casing when said pan is in position in said casing.

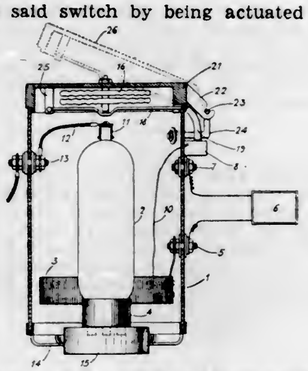
2,101,134

TRANSMISSION

Thomas L. Fawick, Akron, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application April 11, 1935, Serial No. 15,764
14 Claims. (Cl. 74—332)

1. A gear set for motor vehicles having, in combination, an internal gear, a composite gear having external teeth meshing with the internal teeth of said internal gear, a first driven member having external teeth meshing with the internal teeth of said composite gear, a driving member fixed to said internal gear and extending through said internal gear, said composite gear and said first driven member, a second driven member fixed on the extending end of said driving member, a driven shaft, a low ratio spur gear on said driven shaft, a countershaft, an external gear section on said internal gear for driving the countershaft, a spline gear shiftably mounted on said countershaft and adapted to be engaged with said low ratio spur gear and to be disposed forwardly of the latter when disengaged therefrom, and a shiftable member disposed generally in the transverse plane of said spline gear in its disengaged position and having permanent slidable splined driving engagement with said low ratio gear for connecting said first and second driven members selectively to said driven shaft.



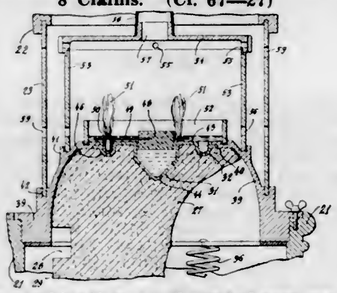
2,101,135

TEMPERATURE CONTROL CONTAINER

James L. Finch, Patchogue, and Lloyd L. Young, Rocky Point, N. Y., assignors to Radio Corporation of America, a corporation of Delaware

Application August 15, 1935, Serial No. 36,342
6 Claims. (Cl. 219—19)

3. A temperature controlled container for enclosing a rectifier tube comprising a container having a pivoted lid portion to provide the circulation of cooling air around said rectifier tube, a thermostat secured to said lid portion and located within said container, a link member adjacent said thermostat and pivoted at one end of said lid, a heating unit within said container to provide heating means therefor, a switch connected to said heating unit, said link member arranged to operate said switch by being actuated by the



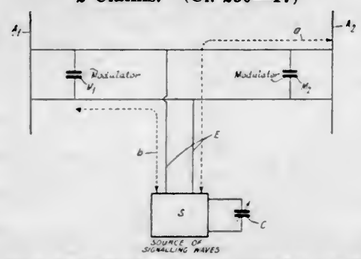
thermostat upon a change of temperature within said container.

2,101,136

CANDLE HOLDER AND CANDLE

Henry Fraternali, Dobbs Ferry, N. Y.

Application December 9, 1936, Serial No. 114,892
8 Claims. (Cl. 67—27)



1. In combination, an elongated wax candle, a disk resting on the top of said candle and having depressed portions for holding wax, a plurality of wicks floatingly supported in said depressed portions by said disk in engagement with the wax and mechanism for holding the candle and disk in abutting relationship.

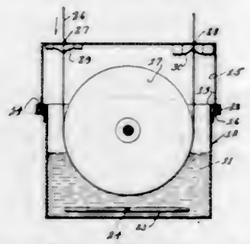
2,101,137

WAVE MODULATION

Karl Fritz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin Germany, a corporation of Germany

Application January 8, 1936, Serial No. 58,066
In Germany February 25, 1935
2 Claims. (Cl. 250—17)

1. In a signalling system a tunable oscillation generator, a plurality of radiators, a separate



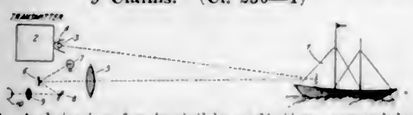
feed line comprising two leads connecting each radiator to said generator, a separate modulating means adjustably connected to each line, and means for simultaneously tuning said generator and adjusting the position of said modulating means along said lines.

2,101,138

APPARATUS FOR REACTING STRIP MATERIAL WITH A LIQUEFIED REAGENT

Erich Gebauer-Fuelnegg, deceased, late of Evanston, Ill., by Marie Gebauer-Fuelnegg, administratrix, Evanston, Ill., and Edouard M. Kratz, Gary, Ind., assignors, by mesne assignments, to Marbo Patents Inc., a corporation of Delaware

Application February 6, 1935, Serial No. 5,218
Renewed June 13, 1936
3 Claims. (Cl. 23—285)



1. Apparatus for reacting strip material with a liquefied reagent, comprising a tank for said liquefied reagent, a removable cover for said tank, sealing means associated with said tank for sealing the joint between said cover and tank, a roll within said tank for carrying strip material into contact with said reagent, means for driving said roll, refrigerating means within said tank and continuous flexible reticulated belts trained to contact said roll for guiding said strip material about said roll.

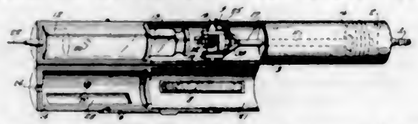
2,101,139

VISIBLE DETECTOR OF INVISIBLE RADIATION

Clarence Weston Hansell, Rocky Point, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application December 31, 1934, Serial No. 760,057
9 Claims. (Cl. 250—1)

1. A detector for invisible radiation comprising a screen for receiving said invisible radiation, a metal salt including water of hydration located on the face thereof and means for mounting said screen within a partial evacuated glass vessel containing a sufficient amount of water vapor to maintain said metal salt in a subsaturated condition.



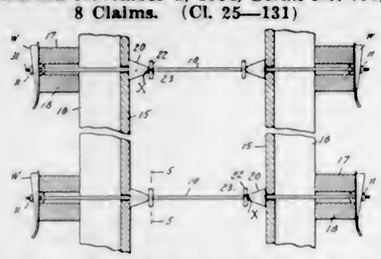
2,101,140

AUTOMATIC INJECTING SYRINGE DEVICE

Raymond W. Hege, San Diego, Calif.

Application March 23, 1935, Serial No. 12,675
6 Claims. (Cl. 128—215)

1. An automatic injecting syringe device comprising, a case adapted to hold a syringe with a plunger in a stationary operable position relative to said case and further adaptable to releasing said syringe, an automatic coupling element adapted to engage, hold, and release the plunger of the said syringe, actuating means with a moveable member operable to move said coupling element back and forth whereby the plunger of the said syringe is moved to fill or empty the said syringe, releasable means comprising a member mounted with the said coupling element and adapted to bear on the inner face of the said case whereby when the said case is operated to release the said syringe the said member operates to allow the said coupling element to release the said plunger, control means comprising a manually operable element mounted on the said case and adaptable to bearing on one or more of the longitudinally moveable elements to control the movement of the said plunger, and operating control means mounted on the said case and adapted to start, stop, or reverse the operative force acting upon the said actuating member whereby the movement of the said actuating member is controlled.



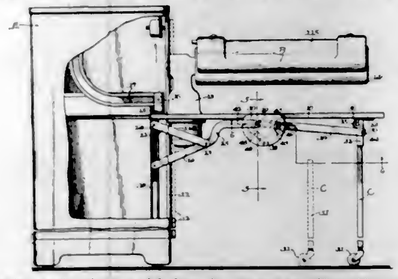
2,101,141

TIE FOR CONCRETE FORMS

Daniel C. Hungerford, Chalfont, Pa., assignor, by mesne assignments, to Star Expansion Bolt Company, New York, N. Y., a corporation of Illinois

Application November 1, 1934, Serial No. 750,921
8 Claims. (Cl. 25—131)

1. In combination, a tie rod having a head adjacent one end and a portion, having flat sides, adjacent said head, a wedge having an opening to receive said head and a slot dimensioned to receive the rod and having a notch communicating with the opening dimensioned to fit the flat sided portion of the rod.



2,101,142

SUPPORTING MECHANISM FOR CABINET IRONERS

Joseph W. Jensen and Alfred J. Shute, Chicago, Ill., assignors to Electric Household Utilities Corporation, Chicago, Ill., a corporation of Illinois

Application June 3, 1936, Serial No. 83,235
14 Claims. (Cl. 312—28)

1. In a structure of the class described, the combination with a cabinet; of an elongated ironer unit adapted to occupy a vertical position in the cabinet or a horizontal position outside of the cabinet; means connected with the cabinet and ironer unit for supporting and guiding the unit as it is moved from one position to the other; an outboard leg carried by the ironer unit, said leg being hinged to the ironer unit and adapted to swing into folded relation thereto; and motion transmitting mechanism actuated by said ironer supporting means for positively swinging said leg in reverse directions as the unit is swung from one position to the other, said motion transmitting mechanism including means for holding said leg in extended supporting position during part of said movement of the unit.

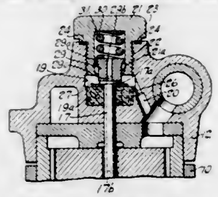
2,101,143

SHOCKPROOF X-RAY UNIT

Alfred H. Laidig, Verona, N. J., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application December 31, 1935, Serial No. 56,897
6 Claims. (Cl. 250—35)

1. A shockproof X-ray apparatus comprising an X-ray tube having an envelope provided with a thermionic cathode and an anode therein, electrode terminals for said anode and cathode, an X-ray opaque housing surrounding said X-ray tube and provided with a pervious window therein in alignment with the ray projecting portion of said X-ray tube, means forming an axial support for said X-ray tube and housing to enable rotation thereof to various positions and connected to said housing and X-ray tube for grounding said housing to render the same shockproof and for supplying electrical energy to said X-ray tube and a cooling and insulating medium to the anode thereof, and said means including flexible conduits integral with a portion of said means and extending longitudinally thereof and forming a fluid-tight seal with said anode terminal, and said means being axially yieldable interiorly of said housing to enable said X-ray tube and housing to be rotated as a unit to various axial positions about said means without destroying the fluid-tight seal or collapsing and straining said flexible conduits.



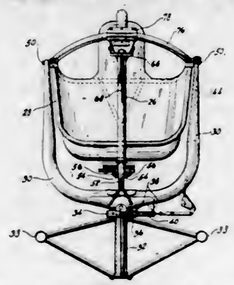
2,101,144

AIR OR WATER TUBE CONNECTION FOR ROCK DRILLS

Earl B. Lear, Detroit, Mich., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey

Application January 7, 1936, Serial No. 57,897
2 Claims. (Cl. 121—10)

1. In a rock drill, a cylinder, a back head therefor having a rearwardly facing recess, a tube coaxial with the cylinder and adapted to conduct cleansing fluid therethrough, said tube projecting into the recess and having a flange formed on its rear extremity, a packing member seated in the closed end of the recess, said flange being seated on said packing member, means for supplying cleansing fluid to the recess, a plug threadably connected to the back head to close the rear end of the recess, said plug having an opening therein which terminates short of the rear end of the plug and which is in communication with the fluid supplying means, a plunger abutting said flange and projecting into the opening in the plug, and a compression spring in the plug having its ends in engagement with the plug and plunger respectively, whereby to urge the plunger, plug and flange forwardly to compress the packing, said plunger and plug being formed with cooperating stop means to prevent removal of the plunger and spring from the plug when the latter is removed from the back head.



2,101,145

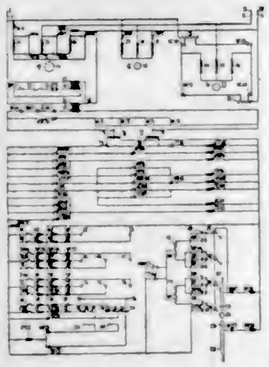
ADJUSTABLE GUNNER'S SEAT

John G. Lee, Avon, Conn., assignor, by mesne assignments, to United Aircraft Corporation, a corporation of Delaware

Application November 10, 1933, Serial No. 697,423
19 Claims. (Cl. 89—37.5)

1. A combined gun support and gunner's seat, comprising a swivel support, a seat, means to pivotally suspend said seat from said support, a gun standard, means to pivotally mount said standard on said seat, and means carried by said seat for limiting the movements of said gun standard to a predetermined path with respect to the seat.

2,101,146



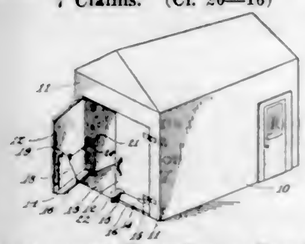
CONTROL SYSTEM

Jacob Daniel Lewis, Yonkers, N. Y., Harold Waters, Hohokus, N. J., and Otto Albert Krauer, Yonkers, N. Y., assignors to Otis Elevator Company, New York, N. Y., a corporation of New Jersey

Application June 15, 1936, Serial No. 85,288
34 Claims. (Cl. 172—152)

33. In a control system for an elevator car; a source of direct current supply; a direct current

motor for raising and lowering said car; a direct current generator for supplying current to said motor, said generator having a separately excited field winding, a shunt field winding and a demagnetizing field winding; means for connecting said separately excited field winding to said source for current supply therefrom to cause generation of voltage of a polarity to start the car in either direction; means operable when the generator voltage of the polarity determined by said separately excited field winding has attained a certain value to connect said shunt field winding across the armature of said generator to cause said generator gradually to build up its voltage to full value, thereby bringing the car up to full speed; means operable automatically upon arrival of the car at a predetermined distance from a



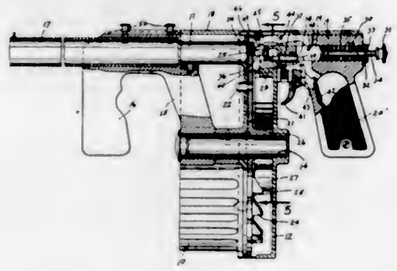
landing at which a stop is to be made for initiating slow down of the car, said means comprising means for connecting said demagnetizing field winding across the generator armature while maintaining the connection of said shunt field winding across the generator armature with the direction of current flow through the demagnetizing field winding such that it acts in opposition to said shunt field winding to effect a gradual decrease in the value of generator voltage; and means operable automatically upon arrival of the car at a point still closer to the landing for disconnecting said shunt and demagnetizing field windings and for causing generator excitation for slow speed operation of the car to be provided by said separately excited field winding connected to said source.

2,101,147

AUTOMATIC UPWARDLY-MOVABLE DOOR OR PORTION THEREOF

Saul Lux, Brooklyn, N. Y.

Application November 20, 1936, Serial No. 111,761
7 Claims. (Cl. 20—16)



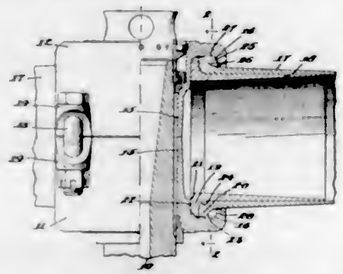
1. In an outwardly swinging door having a substantially-horizontal lower edge, means for permitting said edge to clear an obstruction, said means including a lower edge portion attached to the door and adapted to swing inwardly.

2,101,148

MACHINE PROJECTOR

Charles J. Manville, Indianapolis, Ind.

Application March 11, 1935, Serial No. 10,347
13 Claims. (Cl. 42—5)



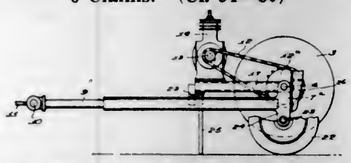
1. A projector for firing cartridges including a muzzle, an annular drum-like magazine rotatably mounted with respect to said muzzle and having a plurality of cartridge chambers extending thereabout, a spring for rotating said magazine to bring an unfired chamber into firing position with respect to said muzzle upon firing of the preceding chamber, a plurality of ratchet teeth for arresting the movement of said magazine in its successive firing positions, a trigger-actuated hammer operating in alignment with said muzzle and registering magazine, a plurality of actuating cams on said chamber for recocking the hammer upon movement of the magazine, and means for locking the magazine in firing position and releasing it for movement to the succeeding firing position by movement of the hammer.

2,101,149

AIRPLANE PROPELLER

Erle Martin, Hartford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application May 7, 1934, Serial No. 724,418
8 Claims. (Cl. 29—156.8)



1. The method of heat treating a metal propeller blade blank having a thickened hollow end comprising heating the blank to a tempering heat, and inserting in the thickened hollow end a cold steel sleeve and cooling the surface of the blank in dies.

2,101,150

MOTOR PROPELLED WHEELED ROLLER

Bart Moore, Jr., San Antonio, Tex.

Application May 6, 1936, Serial No. 78,283
6 Claims. (Cl. 94—50)

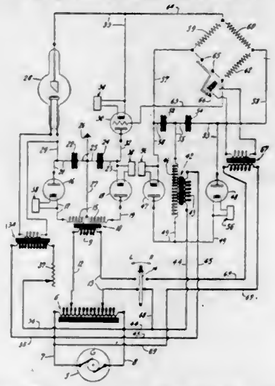
1. The combination with a road rolling structure comprising a bodily invertible main frame, a road roller mounted to turn therein, and ground wheels mounted to turn with respect to said bodily invertible frame and eccentrically disposed with respect to the axis of the roller, whereby either the ground wheels or the roller may be brought into engagement with the ground by the act of bodily swinging the main frame over from one side of the roller to the other, of an engine supporting frame disposed within the confines of the main frame and pivotally mounted with respect to said main frame to thereby permit the aforesaid inversion of the main frame without causing corresponding inversion of the engine supporting frame, an engine carried by said frame, means for driving from said engine to the roller, and means for latching the engine frame to the main frame to thereby support the engine supporting frame from the main frame.

2,101,151

LINTER GIN RIB MOUNTING

George C. Morgan, Birmingham, Ala., assignor to Continental Gin Company, a corporation of Delaware

Application July 6, 1936, Serial No. 88,950
5 Claims. (Cl. 19—62)



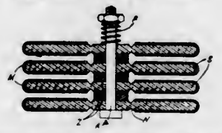
1. A gin rib mounting, comprising in combination an upper rib rail element faced to provide a flat end bearing seat against which the upper rib ends abut, said seat having aligning holes bored with parallel equi-distant axes, a lower rib rail element, ribs each having at one end a stud adapted to fit snugly into one of said holes and a shoulder substantially normal to the line of thrust on a rib and adapted to abut against said upper rib rail seat in front of said stud, and means to secure the lower ends of the ribs in centered relation on the lower rib rail element in conformity with the centering of their upper ends on the upper rib rail, but out of alignment with a plane intersecting the axes of said holes.

2,101,152

X-RAY APPARATUS

Montford Morrison, Montclair, N. J., assignor to Westinghouse X-Ray Company, Inc., a corporation of Delaware

Application December 24, 1931, Serial No. 582,933
2 Claims. (Cl. 250—34)

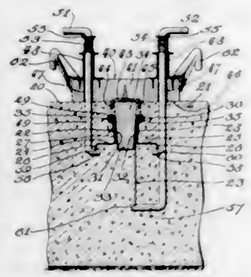


1. In an X-ray system for taking X-ray photographs in a short interval of time, the combination with an energy storage means connected to a source of rectified alternating current energy for accumulating an electrical charge in said energy storage means, and an X-ray tube connected to said energy storage means and adapted to be energized by the charge accumulated therein, of a thermionic discharge device interposed between said energy storage means and said X-ray tube for controlling energization of the latter, an auxiliary source of electrical energy connected to one of the electrodes of said discharge device normally operative to impress a potential thereupon to prevent energization of said X-ray tube and adapted to reverse the polarity impressed upon the discharge device to cause energization of said X-ray tube by the accumulated charge, and means associated with said auxiliary source and said rectified alternating current source, and operable to reverse the polarity of the potential impressed by said auxiliary source upon one of the electrodes of said device to render said discharge device effective to cause energization of said X-ray tube by the accumulated charge and to interrupt the accumulation of a charge in said energy storage device to prevent the imposition of a sinusoidal wave form upon the X-ray tube excitation energy.

2,101,153

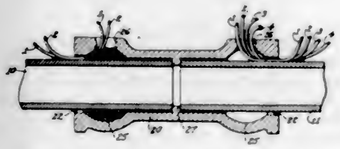
ELECTRICAL CONDENSER

Herbert Muth and Wilhelm Runge, Berlin, Germany, assignors to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany



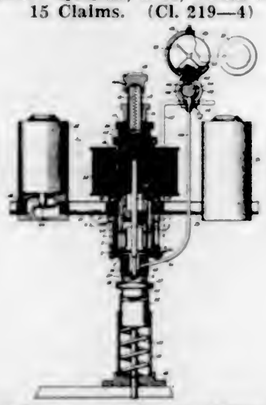
Application March 28, 1934, Serial No. 717,789
In Germany April 21, 1933
7 Claims. (Cl. 175—41)

1. Condenser independent of temperature, comprising a plurality of plates of ceramic ma-



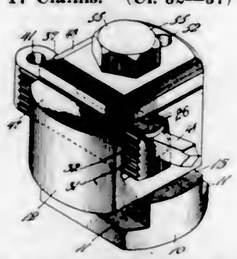
terials which serve as supports of a metallic conducting layer for said condenser, said plates being separated by a plurality of metal spacers, characterized in that said plates have central places of contact maintained free of the layer where said metal spacers are located, said places of contact being surrounded by an annular groove in which the conducting layer terminates.

2,101,154
EXPANSION JOINT FOR PAVEMENTS AND THE LIKE
Clifford Older, Wilmette, Ill.
Original application August 8, 1931, Serial No. 555,949. Divided and this application May 6, 1933, Serial No. 669,632
12 Claims. (Cl. 94—18)



1. In a concrete road joint forming member, the combination of an expansion strip having a main fold with a pair of substantially parallel flanges, an auxiliary flange engaging each of said parallel flanges, anchoring flanges carried by said auxiliary flanges, a parting strip clamped between one of said parallel flanges and said auxiliary flanges, substantially cylindrical formations joining each of said auxiliary flanges to one of said parallel flanges, a template for supporting said strips, means carried by the template for engaging between said parallel flanges and means for holding said parting strip against said template.

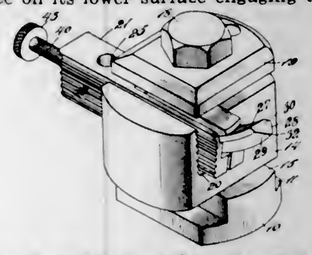
2,101,155
PIPE JOINT
Alden E. Osborn, New York, N. Y.
Application October 5, 1936, Serial No. 104,011
7 Claims. (Cl. 285—163)



1. A fitting having a channel and provided with an aperture intersecting said channel, and a means for retaining a member within said fitting and for preventing leakage adjacent said means of retention, comprising a wire of relatively hard material and a second wire of relatively soft material, both said wires being adapted to be simultaneously wound thru said aperture and into said channel by relative rotation between said fitting and said member.

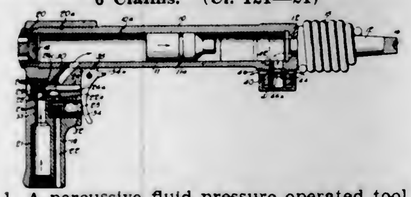
2,101,156
MACHINE FOR SEALING RECEPTACLES
John H. Payne, Ballston Spa, N. Y., assignor to General Electric Company, a corporation of New York
Application April 28, 1936, Serial No. 76,796
15 Claims. (Cl. 219—4)

1. A machine for sealing metallic receptacles comprising a gas-tight chamber having a single opening therein adapted to be closed by abutment of the apertured face of a work-piece, a storage receptacle for retaining a quantity of closure elements for sealing said workpiece, and means operative from time to time for supplying single closure elements to said chamber from said storage receptacle while maintaining the former in substantially gas-tight condition.



2,101,157
LATHE TOOL POST
Joseph M. Redinger, Johnston, R. I.
Application April 1, 1936, Serial No. 72,010
17 Claims. (Cl. 82—37)

1. A lathe tool post comprising a base to slidably engage the tool post carriage of a lathe, a body movably mounted thereon, a resilient tool holder in said body having an opening for the reception of a tool, and means including a single operable element for binding the tool in the holder and the parts against movement one with relation to the other.

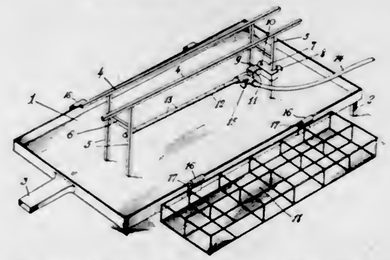


2,101,158
LATHE TOOL AND HOLDER THEREFOR
Joseph M. Redinger, Johnston, R. I.
Application April 23, 1936, Serial No. 75,948
5 Claims. (Cl. 29—101)

1. In combination, a tool holder provided with an arcuate guide channel and a tool having an arcuate shape to fit said channel, means for relatively moving the opposite sides of the channel to bind the tool in adjusted position therein, a block arcuate on its lower surface engaging the upper

surface of said tool, and means engaging said block for forcing said tool towards said guide to hold the same in adjusted position.

2,101,159
PNEUMATIC HAMMER
Edward W. Stevens, Detroit, Mich., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey
Application September 11, 1935, Serial No. 40,038
6 Claims. (Cl. 121—21)



1. A percussive fluid pressure operated tool of the single impact type comprising a cylinder providing a piston chamber, a hammer piston reciprocable therein, manually controlled means for admitting pressure fluid to the rear end of the piston chamber to drive the piston forwardly, means for admitting holding pressure fluid to the front end of the piston chamber to return the piston and hold it normally at the rear end of the cylinder, and means for intercepting holding pressure fluid seeping toward the rear of the piston, said last-named means comprising an annular groove in the piston and a cylinder port connected to exhaust, said port being positioned to register with the groove when the piston is held at the rear end of the cylinder.

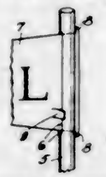
2,101,160
CONTROL DEVICE
Herman Weber, Kalamazoo, Mich., assignor to Shakespeare Products Company, Kalamazoo, Mich.
Application August 13, 1936, Serial No. 95,756
6 Claims. (Cl. 74—502)

1. In a control device of the character set forth, the combination of a tubular support provided with a collar having a peripheral groove, said support and collar having registering radial bores, a toothed detent arranged in said bores and provided with a socket in its outer end and having a non-circular head engaging said groove whereby it is supported against rotative movement, a spring arranged in said socket, a housing sleeved on said collar and acting to retain said spring under tension, and a control rod reciprocable and rotatable in said support and having a series of transverse slots at one side providing a series of teeth and having a flattened surface at one side of said teeth, the bottoms of the teeth being at an angle to the said flattened surface so that the rod may be rotated to engage or disengage its said teeth with said detent in any of its longitudinally adjusted positions and may be longitudinally adjusted when the teeth are disengaged, and its said flattened surface engaged with said detent, the detent then acting as a friction member, the detent also acting to yieldably resist rotation of the rod from one rotative position to the other and also acting to fully actuate the rod as it is actuated from one rotative position to the other.

2,101,161
SLIDE STAINING AND HEATING RACK
Arthur Whiteman, New York, N. Y.
Application March 19, 1937, Serial No. 131,889
3 Claims. (Cl. 34—21)

1. A slide staining and heating rack comprising a tray, a rack in said tray for supporting slides, a bracket adjustably secured to said rack, a gas heater pipe movably and frictionally carried by said bracket, means for supplying gas to said pipe and a valve for controlling the gas supply.

2,101,162
ORNAMENTAL REFLECTOR AND SIGN
Dee A. Wing, Detroit, Mich.
Application July 3, 1935, Serial No. 29,629
3 Claims. (Cl. 40—135)



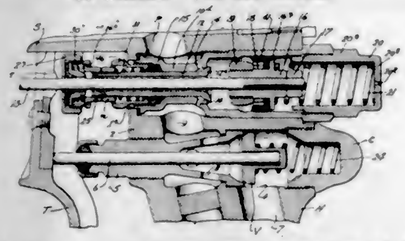
3. In a reflecting sign, a case, a patterned transparent glass panel mounted therein, a patterned aluminum reflecting panel spaced from the transparent glass panel, and flat flexible characters mounted on the inner face of the transparent panel to form a sign in the reflected light field.

2,101,163
PENNANT AND STAFF MEANS
Joseph A. Wolfe, Seattle, Wash.
Application March 2, 1936, Serial No. 66,579
2 Claims. (Cl. 116—173)

2. In a device of the class described, a staff having a longitudinally extending slot therein; a pennant positioned within said slot; stop means on an end portion of said pennant engaging said

staff limiting movement in one direction of said pennant within said slot; and sidewise deflectable

staff engaging integral tab means in said pennant just forward of said stop means.



2,101,164

SPRAY GUN WITH PNEUMATIC NEEDLE VALVE CONTROL

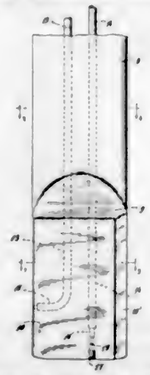
Svend Bramsen and Fritz Wahlin, Chicago, Ill., assignors to Binks Manufacturing Company, Chicago, Ill., a corporation of Delaware

Application November 27, 1935, Serial No. 51,764

20 Claims. (Cl. 299—140.1)

1. In a pneumatic spraying appliance of the class in which a rod-like needle valve is longitudinally moved rearwardly for opening the discharge of material, and in which the body of the appliance has a bore coaxial with the needle valve: a rearwardly closed cylinder mounted in the said bore and housing the rear end portion of the said valve, a piston fast upon the valve and slidable in the said cylinder, a spring interposed between the piston and the rear end of the cylinder for continually urging the piston forwardly; the cylinder having a tubular guide of relatively smaller bore coaxial with and extending forwardly from the cylinder and connected to the cylinder by an annular portion presenting a rearwardly facing annular valve seat; a tube longitudinally slidable in the said guide and through which tube a part of the needle valve extends, the tube having a rearward portion adapted to seat on the said valve seat; the said tube and guide being so formed as to afford an annular space around a part of the tube forward of the said seat when the said tube part is thus seated; the gun body having an air passage, and the guide having an air port leading from the air passage to the said space.

2,101,165



PITOT TUBE

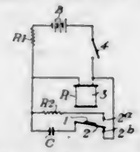
Edward S. Cole and Edward Shaw Cole, Montclair, N. J., and Leslie J. Hooper, Holden, Mass., assignors to Pitometer Log Corporation, a corporation of New York

Application March 3, 1936, Serial No. 66,892

5 Claims. (Cl. 73—212)

5. In a Pitot tube instrument, the improvements that comprise, a thin end having a vertical, reduced trailing edge and having a vertical static passage therein that is located between the forward and trailing edges of said end at approximately one third of the horizontal length of said end in advance of said trailing edge, said end having lateral openings connecting with said static passage and placed at unequal distances

from the extremity of said end, whereby the liquid in which the instrument is immersed is caused to follow a tortuous path that is mainly transverse to said end when said instrument is turned at acute angles from true alignment with the direction of movement of the surrounding liquid.



2,101,166

ELECTROMAGNETIC APPARATUS

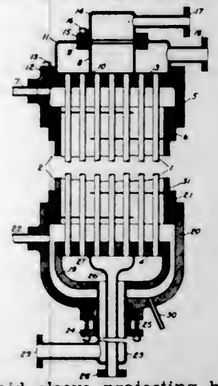
Paul H. Crago, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application June 30, 1934, Serial No. 733,282

7 Claims. (Cl. 175—320)

1. In combination, a source of direct current, an electromagnetic device having an energizing winding and an armature operated thereby as well as a back contact operated by said armature, means for connecting said winding with and disconnecting it from said source, and a condenser connected in multiple with said winding through said back contact for delaying operation of said armature when said winding becomes connected with said source.

2,101,167



METHOD OF MAKING AND ARRANGEMENT OF INTERCHANGER FOR HEAT EXCHANGE BETWEEN FLUIDS AT LOW TEMPERATURES

William Lane De Baufre, Lincoln, Nebr.

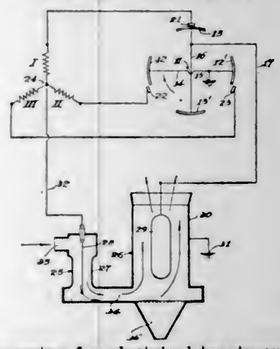
Application August 19, 1935, Serial No. 36,882

11 Claims. (Cl. 29—157.3)

1. A method of making an interchanger with a cold worked metal shell for heat exchange between fluids at temperatures below the annealing temperature of said shell, which includes selecting a shell having a thickness sufficient to safely withstand in the cold worked condition the pressure of one of said fluids, placing a reinforcing sleeve around said shell at the end thereof, heating the end of said shell and said sleeve to form a fused metal joint between them while maintaining the shell beyond said sleeve at a temperature sufficiently low to prevent any substantial lowering of the tensile strength of said shell beyond said sleeve, placing a head around said

sleeve with said sleeve projecting beyond said head and over said shell, heating said head and said sleeve to form a fused metal joint between them while maintaining the shell beyond said sleeve at a temperature sufficiently low to prevent any substantial lowering of the tensile strength of said shell beyond said sleeve.

2,101,168



ELECTRICAL PRECIPITATION APPARATUS

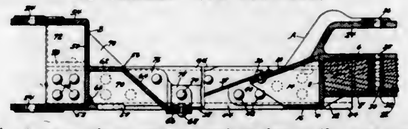
Walther Deutsch, Frankfort-on-the-Main, Germany, assignor to International Precipitation Company, Los Angeles, Calif., a corporation of California

Application February 23, 1937, Serial No. 127,287

In Germany February 24, 1936

1 Claim. (Cl. 183—7)

An apparatus for electrical treatment of fluids comprising two separate electrode systems each comprising two opposing electrode members spaced from one another to accommodate flow of gas therebetween; a polyphase transformer with Y-connected secondary phase windings having a common point connected to one end of each winding; means electrically connecting one electrode member of one of said electrode systems to said common point; and synchronously operated mechanical rectifying means associated with the other terminals of said windings, and with the other electrode member of said one system, and also with the two electrodes of the other electrode system, said rectifying means being operable to successively connect the several phases individually to said other electrode member of said one system and to successively connect different successive pairs of phases in series between the two electrode members of said other system.



2,101,169

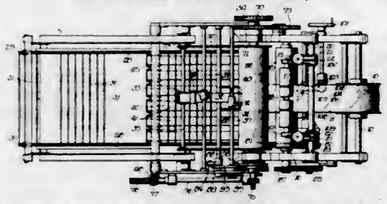
MINE CAR END CONSTRUCTION

William F. Dietrichson, Berwick, Pa., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey

Application August 17, 1935, Serial No. 36,644

25 Claims. (Cl. 105—364)

1. A one-piece end member for rail cars comprising, a substantially vertical web extending between and connected with the side sills of the car, spaced apart flanges extending horizontally outward from one side of said web and adapted to support a bumper element, spaced apart rearwardly directed flanges extending from the opposite side of said web, one of said last named flanges having at least a portion thereof inclined downwardly toward the other flange, and spaced apart bracing members connecting said web and rearwardly directed flanges.



2,101,170

SHEETER

William H. Engel, Mount Vernon, Ohio, assignor to Shellmar Products Company, Mount Vernon, Ohio, a corporation of Delaware

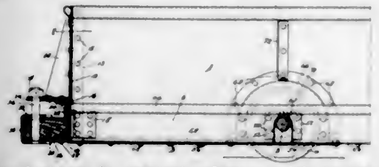
Application March 25, 1935, Serial No. 13,007

11 Claims. (Cl. 271—76)

1. In a device of the type described having means for advancing a continuous web of material and a cutting unit in the path of travel of said web for severing individual sheets therefrom, the combination of a relatively high speed conveyor system engaging the forward edge of sheets extending through said cutting unit, a relatively slow speed conveyor adjacent and beneath said cutting unit, and a striker operable to press the trailing end of a sheet in said relatively high speed conveyor system against said relatively slow speed conveyor to disengage said sheet from the relatively high speed conveyor.

2,101,171

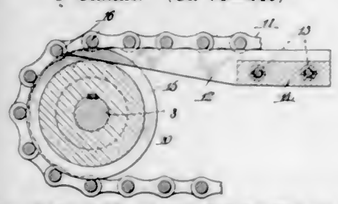
MINE CAR



Henry P. Field, Berwick, Pa., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey

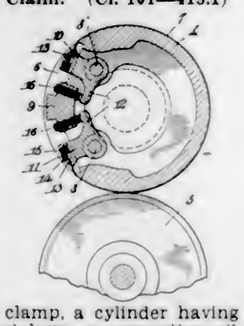
Application October 1, 1931, Serial No. 566,199

19 Claims. (Cl. 105—364)



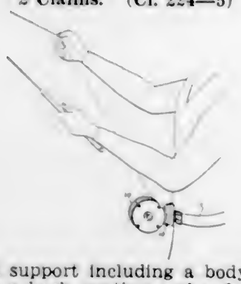
1. In a mine car a body comprising side walls, end walls and a bottom formed of a plurality of

parts connected together on lines which are transverse to the body, at least some of said parts extending from side wall to side wall in a substantially uniform horizontal plane, and sills secured



to the bottom in spaced relation with respect to the side walls and extending longitudinally of the bottom from end to end, the remaining parts of said bottom extending only between the sills.

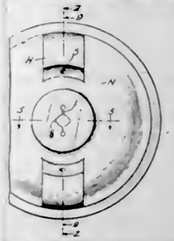
2,101,172
SPROCKET CHAIN TRUING DEVICE
William Gegenheimer, Brooklyn, N. Y., assignor to Willard Manufacturing Corporation, New York, N. Y., a corporation of New York
Application August 26, 1936, Serial No. 98,092
3 Claims. (Cl. 74—240)



1. In a chain guide, a sprocket having an annular central groove in its periphery, a finger affixed adjacent to said sprocket and projecting into said groove, the said finger disposed tangentially to said sprocket.

2,101,173
PLATE CLAMP
William Gegenheimer, Brooklyn, N. Y., assignor to Willard Manufacturing Corporation, New York, N. Y., a corporation of New York
Application August 26, 1936, Serial No. 98,094
1 Claim. (Cl. 101—415.1)

In a plate clamp, a cylinder having an opening in its periphery, a supporting rib inwardly of the circumference of said cylinder and within said opening, levers rockably mounted in said cylinder one on each side of said rib, clamps on said levers, an arm for each lever underlying said rib, adjusting members on said rib engaged with said arms for rocking the latter, screws on said clamps for operating the same, and the adjusting members and screws being substantially parallel with each other, having their operating portions disposed substantially equal distances from the axis of the cylinder and all located relatively close together, thus permitting of adjustments of all said members and screws in one position of adjustment of the cylinder.

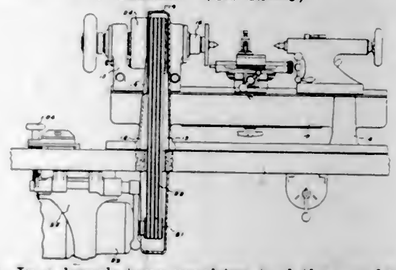


2,101,174
SUPPORT FOR FISHING REELS
John Grahame, Sixes, Oreg.
Application October 9, 1936, Serial No. 104,834
2 Claims. (Cl. 224—5)

1. A reel support including a body, said body comprising a back portion and a front portion, said back portion being slightly curved to conform to the body of the wearer, a U-shaped resilient attaching clip having parallel ends secured to said back, the portion of said clip beyond the ends being spaced from the back, said front portion including an intermediate central portion which is curved concentric with the back and is spaced therefrom, said central portion having substantially parallel sides directed towards the back, said sides having end flanges thereon, said end flanges being in direct engagement with the back and secured thereto, the corner of said back and the end flanges being coextensive and curved and with the end flanges secured throughout to the back portion to provide a rigid portion of double thickness, said front face having a slot therein adjacent the bottom thereof, the wall of said front face below the slot being outwardly curved to provide a pocket adapted for the reception of the lower end of a fishing reel bracket, said front portion having a pair of spaced slots vertically extending and disposed adjacent the upper part thereof, an outwardly pressed portion arranged between said spaced slots, said outwardly pressed portion being in line with said pocket, a slide comprising a metal strip having its ends passing through said slots and bent towards each other with the bent ends disposed between the central portion and the back, said slide including a curved front portion adapted to engage the upper bracket on a fishing reel.

2,101,175
AIR NOZZLE FOR FLAT-SPRAYING APPLIANCES
Eric Gustafsson, Chicago, Ill., assignor to Binks Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application November 9, 1936, Serial No. 109,905
9 Claims. (Cl. 299—140.1)

5. In a spray appliance of the class in which a stream of generally liquid material is forwardly projected through a material nozzle, and in which an air nozzle has both a central port through which air is forwardly projected around and in merging relation to the said material stream and two side air ports for projecting forwardly converging jets of air respectively against opposite sides of the said stream, and in which the axes of the said jets are in a plane diametric of the said central port, the said air nozzle characterized by also having the said central port provided with two counterpart enlargements respectively at opposite sides of the central air port; each of the said enlargements comprising a bore portion spaced from the said central port and a



slot portion of less width than the said bore leading from the said bore to the said central port, the axis of the said bore portion and the medial plane between the longitudinal walls of the said slot portion being both in the aforesaid plane, the axis of the said bore portion being at an angle of between zero and ten degrees to the axis of the central port.

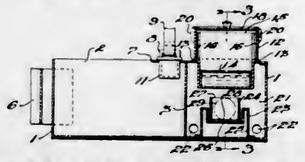
2,101,176
HIGHWAY GUARDRAIL
Lewis H. Height, Denver, Colo., assignor to Thompson Manufacturing Co., Denver, Colo.
Application November 30, 1936, Serial No. 113,400
7 Claims. (Cl. 256—13.1)

1. Means for supporting a highway guard rail comprising: a post member extending into the ground and terminating at the surface thereof; a bracket member consisting of an inverted V-shaped resilient member; sleeves formed in the lower extremities of the legs of said bracket member; pins passing through said post member and through said sleeves for securing said bracket member to said post member; and means for securing a highway guard rail to said bracket member.

2,101,177
BENCH TYPE MACHINE TOOL
Frank O. Hoagland, West Hartford, Conn., assignor to Niles-Bement-Pond Company, Hartford, Conn., a corporation of New Jersey
Application September 10, 1936, Serial No. 100,143
7 Claims. (Cl. 82—6)

1. In a bench type machine tool the combination of a bed having a transverse opening therethrough, a headstock on said bed having a supporting and rotating spindle therein, a pulley fixed on said spindle, and a driving belt passing over said pulley and extending within said headstock and through said opening in said bed.

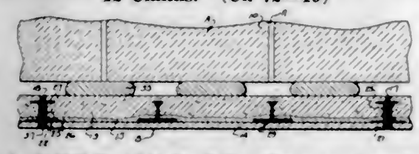
2,101,178
APPARATUS FOR PLATING SHEETS
George B. Hogaboom, New Britain, Conn., and Wesley F. Hall, Matawan, N. J., assignors to Hanson-Van Winkle-Munning Company, Matawan, N. J., a corporation of New Jersey
Application December 13, 1934, Serial No. 757,314
12 Claims. (Cl. 204—5)



1. An electroprocessing machine comprising means for gripping a sheet of material to be treated, a carrier for supporting said gripping means, vertical conveying devices for vertically transporting said carrier, horizontal conveying devices for horizontally transporting said carrier to cause said sheet to move through the treating solutions, vertical transfer devices for vertically transferring said carrier and said sheet over the boundaries between the treating tanks and intermediate conveyor means for shifting said carrier between said vertical conveying and transfer devices without substantial shock.

2,101,179
METHOD OF AND APPARATUS FOR OPERATING ON UNATTACHED SOLES
Charles E. Hood, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 12, 1935, Serial No. 54,112
17 Claims. (Cl. 12—17)

1. That improvement in methods of preparing unattached shoe-soles for attaching with adhesive cement, which consists in simultaneously shaving two marginal bands one within the other on the attaching face of a sole, and at the same time disintegrating the surface of the inner one of said bands.

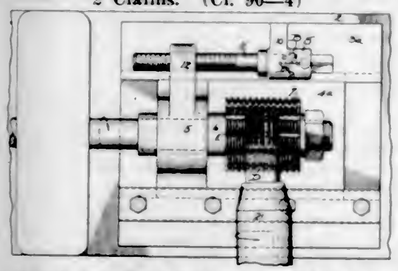


2,101,180
PORTABLE COOKER
Charles Jacobs, Detroit, Mich.
Application March 10, 1936, Serial No. 68,122
3 Claims. (Cl. 126—261)

2. A portable cooker comprising a portable casing having a cooking compartment, a cover extending over the cooking compartment and hav-

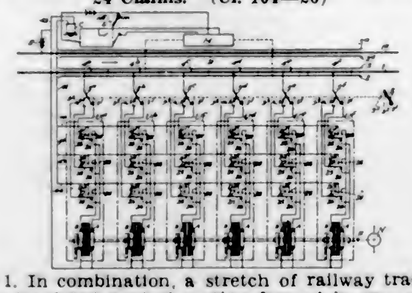
ing a rectangular aperture, a substantially rectangular cooking receptacle positioned in said aperture, a fuel drawer slidably mounted in the cooking compartment below the receptacle, a series of transverse partitions dividing the fuel drawer into fuel compartments each arranged to receive a piece of fuel, the bottom of said drawer being provided with a draft opening in each compartment and means for varying the draft openings of all compartments simultaneously.

2,101,181
BUILDING BLOCK
Charles E. Johnson, Chicago, Ill., assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application October 2, 1936, Serial No. 103,631
12 Claims. (Cl. 72—19)



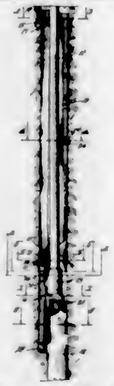
1. A building block of the character described comprising a body portion formed from plastic material, a face plate of vitreous material covering a surface of the body portion and provided with grooves in opposite edges thereof, and a metal frame arranged entirely around said body portion and having portions thereof received within the grooves in the edges of said face plate.

2,101,182
COMPOSITE PRODUCT
Harvey G. Kittredge and Frank W. Williams, Dayton, Ohio, assignors to Foilfilm, Inc., Dayton, Ohio, a corporation of Ohio
No Drawing. Application February 18, 1935, Serial No. 7,070
2 Claims. (Cl. 91—70)



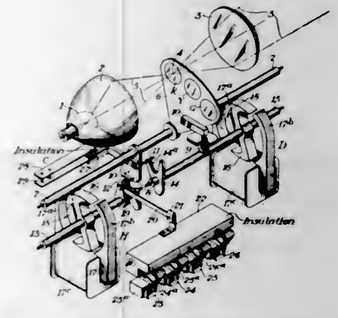
1. An article of manufacture comprising a structurally weak metal foil element and a relatively thin adhesive and protective glass-adherent coating baked thereon and consisting of vinyl acetate, phenolic resin, and chlorinated diphenyl, to provide a strong, tough and flexible coating for the foil.

2,101,183
ARRANGEMENT FOR RESETTING HOBS
Howard B. Lawton, Detroit, Mich.
Application October 15, 1935, Serial No. 45,025
2 Claims. (Cl. 90—4)



1. A hob re-setting means comprising a guide, a bearing on said guide having an index mark thereon, a cross slide mounted on the guide, a nut on the guide, a spindle carried by the cross slide having a hob fixed thereon, a feed screw mounted on the bearing for rotation and held against axial movement, said screw having an index mark thereon adapted to register with the index mark upon the bearing, and the lead of the hob and feed screw being relatively so proportioned whereby each time the screw is turned sufficiently to bring the two index marks into registry throughout the entire cutting range of the hob the latter is again in correct operating position.

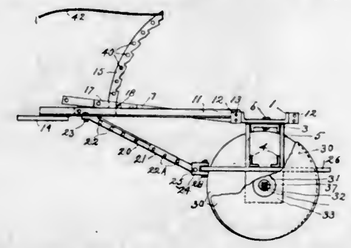
2,101,184
RAILWAY CAR RETARDER
John W. Livingston, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application July 9, 1935, Serial No. 30,528
24 Claims. (Cl. 104—26)



1. In combination, a stretch of railway track, an insulated control section formed in one rail of said stretch, a member biased to one position, a contact mechanism including a normally closed and a normally open contact, means controlled by said member for operating said contact mechanism to open said normally closed contact and close said normally open contact when said member is moved away from said one position a predetermined amount, an electromagnet, means effective when said electromagnet becomes energized for moving said member away from said one position at a predetermined rate of speed, an energizing circuit for said electromagnet including said control section, the opposite rail of said stretch and said normally closed contact; and an electroresponsive device controlled by said normally open contact.

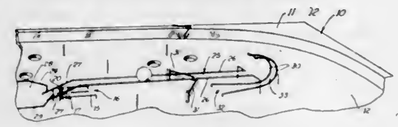
2,101,185
WELL DRILLING WHIP STOCK
Daniel B. Monroe, Denver, Colo.
Application October 22, 1936, Serial No. 106,955
7 Claims. (Cl. 255—1)

1. A device for deviating the course of a drill pipe and drill in an oil well comprising: a relatively long member having a passage for said drill pipe; a lower bearing in said member forcing said drill pipe in one direction; an upper bearing in said member forcing said drill pipe in the opposite direction; a key and socket joint for preventing relative rotation between said drill pipe and said member; and a spring acting to support said drill pipe in said member to maintain said key in its socket, said spring being positioned so that a predetermined pressure on said drill pipe will compress said spring to release said key.



2,101,186
LIGHT SIGNAL
Alexander Davis Moore, Merwood, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application August 6, 1936, Serial No. 94,613
3 Claims. (Cl. 177—327)

2. A light signal comprising a first pivoted shaft, a spectacle arm secured to said first shaft for rotation from a stop position to a proceed position through a caution position and biased by its own weight to its stop position, an operating member secured to said shaft and provided with two laterally projecting pins, a second and a third pivoted shaft, a first electromagnet having its armature secured to said second shaft in such manner that rotation of such armature from its deenergized to its energized position will rotate said second shaft from a first to a second position, a second electromagnet having its armature secured to said third shaft in such manner that rotation of such armature from its deenergized to its energized position will rotate said third shaft from a first to a second position, means for biasing said second and third shafts to their first positions, a first dog secured to said second shaft and cooperating with one of said pins in such manner that rotation of said second shaft from its first position to its second position will rotate said spectacle arm from its stop to its caution position, and a second dog secured to said third shaft and cooperating with the other pin in such manner that rotation of said third shaft from its first position to its second position will rotate said spectacle arm from its caution to its proceed position.

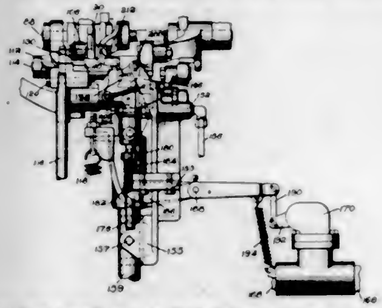


2,101,187
LEVEE DISK
Ray Olson and Archie Olson, Kingsburg, Calif.
Application April 11, 1936, Serial No. 73,867
7 Claims. (Cl. 55—30)

1. A ridging device comprising two gangs of disks, each gang being pivotally attached to a common base, said disk being positioned so the concave faces of the disks of one gang face in the opposite direction of the concave faces of the other gang, draft means consisting of two draft bars pivotally attached to the common base a spaced distance from the lateral center of said base, the free ends of the draft bars meeting at and attached to a hitch, and means for angling the disk blades with the line of draft consisting of a tie for each gang, each of said ties being pivotally attached at one end to the support for

the disk gang a spaced distance below the common base, and a spaced distance to the right or to the left of the local of the connection attaching the draft bar to the common base, the other end being pivotally attached to the draft bar, a lever attached at one end to the common base and at approximately right angles thereto, said lever extending toward the hitch, and being adapted to be raised or lowered with relation to the hitch, and means for holding the lever in selective raised positions.

2,101,188
GAME APPARATUS
Joseph W. Orcutt, Harry A. Stearns, and Thomas L. Wall, Los Angeles, Calif.
Application January 21, 1935, Serial No. 2,664
9 Claims. (Cl. 273—119)

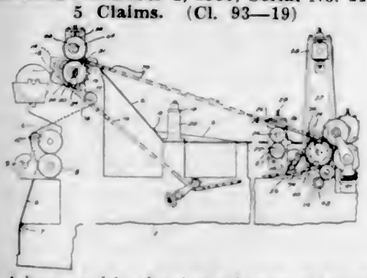


8. In a game apparatus, a cabinet including a member providing a ball-playing surface; a ball runway arranged upon said playing surface above the latter; means arranged adjacent one end of said runway for reprojecting a ball over said playing surface; and means arranged upon said playing surface adjacent the other end of said runway for reversing the direction of travel of a ball thus reprojected over said playing surface and for depositing the same upon said runway.

2,101,189
MACHINE FOR PRESSING SOLES ON SHOES
Charles H. Pepin, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application August 5, 1936, Serial No. 94,403
In Great Britain May 15, 1936
13 Claims. (Cl. 12—33)

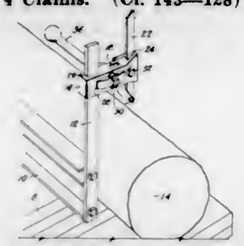
1. A machine for applying pressure to shoe bottoms having, in combination, a pad arranged to apply pressure to a sole and shoe, means for relatively positioning the sole and shoe on the

pad, means for locking the positioning means in



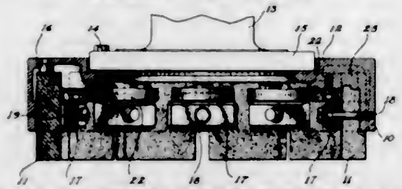
operative position, and fluid-pressure-controlled means for releasing said locking means.

2,101,190
COOL DRINK DISPENSER
William Wallace Philley, Valparaiso, Ind.
Application May 7, 1935, Serial No. 20,230
4 Claims. (Cl. 62—143)



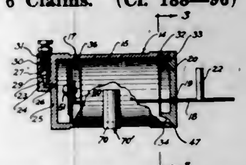
1. The method of preparing a beverage for dispensing, which comprises the steps of partially filling a container of the bottle type having a closed bottom with the beverage material in liquid form, surrounding said receptacle with a refrigerating medium and forming said beverage into a solid block traversed centrally by a bore opening through the upper and lower faces of said block, separating said container from said medium, inverting the container and connecting the space between said bottom and said block to the atmosphere by a liquid tight passage extending through said bore and any liquid therein and the space in the inverted receptacle below said block to means for controlling the discharge of beverage from the receptacle.

2,101,191
WEB CUTTING MECHANISM FOR BAG MACHINES
George W. Poppe, Brooklyn, N. Y., assignor to Equitable Paper Bag Co., Inc., Brooklyn, N. Y., a corporation of New York
Application December 1, 1936, Serial No. 113,565
5 Claims. (Cl. 93—19)



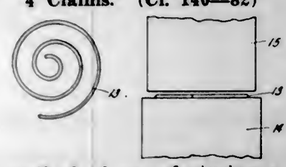
4. A bag machine having a former about which a web of paper is wrapped to form a bag tube, with means for continuously advancing the tube and web; in combination, cutters for making cuts in the web at bag section intervals apart, means for rotating said cutters, said rotating means including two gears each gear being so mounted that it may be made to describe an eccentric path during a rotation, and means whereby the degree of eccentricity of each gear may be varied in equal and opposite degree, the degree of eccentricity having a definite relation to the surface speed of the web.

2,101,192
CLAMP HEAD
Sidney A. Prewitt, Pleasant Hill, Mo.
Application September 2, 1936, Serial No. 99,059
4 Claims. (Cl. 143—128)



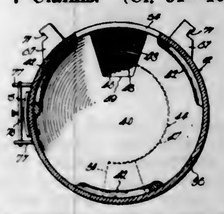
1. In a saw mill having a frame for supporting a log, a clamp head comprising a standard; a block slidably mounted on the standard for movement longitudinally therealong toward and from a log on the frame; a spike, having a notch therein, slidably mounted in the block; a lever pivotally carried by the block having a gear formed at one end thereof; a gear segment having teeth in engagement with the said gear and a laterally extending lug extending into the notch in the spike; a dog on the block movable toward and from the standard; and means interconnecting the lever and said dog for alternately moving the dog toward and from the standard as the lever is oscillated about its pivotal connection with the block, said spike being longitudinally reciprocated toward and from the log simultaneously as the dog grips and disengages the standard respectively.

2,101,193
ABRASIVE WHEEL
Robert R. Raber, West Hartford, Conn., assignor, by mesne assignments, to Niles-Bement-Pond Company, New York, N. Y., a corporation of New Jersey
Application November 30, 1934, Serial No. 755,293
4 Claims. (Cl. 51—209)



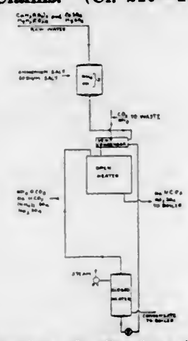
1. An abrasive wheel head comprising in combination, a body member, reinforcing members therein, abrasive blocks within said body member positioned against said reinforcing members, clamping means for said blocks, and rotatable plate-like members pivotally supported upon fixed axes within said body member adapted in one position to engage the inner ends of adjacent blocks to support said blocks in advanced positions.

2,101,194
DASH POT
Bruno Radtke, Libertyville, Ill., assignor to John F. Meyer, Chicago, Ill.
Application March 14, 1934, Serial No. 715,573
6 Claims. (Cl. 188—96)



1. A dashpot comprising a cylinder having an integrally formed and a removable axial end wall, valve means on said integral wall, said cylinder having an air vent intermediate said valve means and said removable end wall, a piston reciprocable in said cylinder and drive means for said piston including an elongated flat piston rod extended through said removable end wall into said cylinder eccentrically with respect to the latter and having its inner end portion upturned to form a laterally extending arm, and means attaching said arm to a substantially central part of said piston.

2,101,195
METHOD OF MANUFACTURING PAPER CLIPS
Howard D. Randall, Cincinnati, Ohio
Original application November 1, 1933, Serial No. 696,237. Patent No. 2,047,129, dated July 7, 1936. Divided and this application March 15, 1935, Serial No. 11,307
4 Claims. (Cl. 140—82)

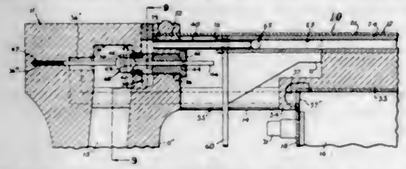


1. The method of manufacturing a thin flat paper clip having a high degree of resiliency and holding power, which method comprises the steps of bending into a spiral having spaced convolutions, a length of light gauge wire which initially offers but little resistance to manual bending, and then swaging the spiral formation between flat surfaces with sufficient force to flatten opposite sides thereof to result in a thin spiral ribbon formation having all points on its convolutions disposed in a common plane.

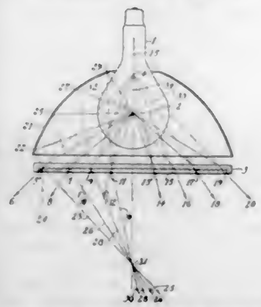
2,101,196
TUMBLING MILL
Nathan Ransohoff, Cincinnati, Ohio
Application June 26, 1935, Serial No. 28,496
7 Claims. (Cl. 51—164)

1. In a tumbling mill, a rotatably mounted cylinder, reversible means for rotating said cylinder, said cylinder having partitions therein dividing it into a central tumbling chamber and storage chambers at the respective ends for abrading or burnishing elements, means within the tumbling chamber for moving the burnishing or abrading elements from the center thereof outwardly against the partitions upon one direction of rotation of the cylinder, and scoop elements connecting the central chamber with each end chamber, said scoops effective for transferring the burnishing or abrading elements from the central chamber to the end chambers when said cylinder is being rotated in said direction of rotation.

2,101,197
TREATMENT OF BOILER WATER
Cyrus W. Rice, Pittsburgh, Pa.
Application May 11, 1935, Serial No. 20,928
7 Claims. (Cl. 210—14)



1. In the softening of a flowing stream of water the herein described method of controlling the relative retention in the water of radicals combinable to produce temporary hardness and those combinable to produce permanent hardness, which comprises determining the relative proportion of temporary hardness compounds and permanent hardness compounds in the raw water, regenerating a zeolite bed with ammonium and sodium containing reagents causing inclusion of both ammonium radical and sodium radical in the zeolite bodies while apportioning the reagents to cause relative inclusion of the ammonium radical with respect to the sodium radical in a ratio based upon the relative content of temporary hardness forming radicals and permanent hardness forming radicals in the raw water and predetermined with respect to the extent to which it is desired to eliminate the temporary hardness forming radicals from the water, passing raw water through said zeolite bed and thereby causing inclusion of ammonium and sodium radicals in the effluent in the ratio in which they are present in the zeolite bed, heating the effluent to thereby cause combination of approximately the entire content of ammonium radical with temporary hardness forming radicals and thereby to decompose ammonium compounds, and venting the products of such decomposition from the effluent while retaining in the effluent the sodium radical and hardness forming radicals to the extent that they are combined with the sodium radical.

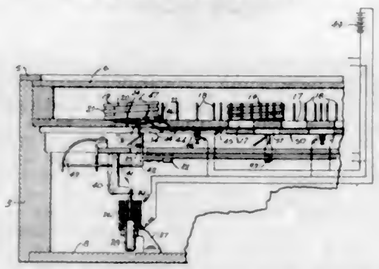


2,101,198
AIR GUN
William C. Robinson, Bell, Calif.
Application June 12, 1936, Serial No. 84,855
12 Claims. (Cl. 124—15)

1. An air gun including a stock, an air reservoir and an outer barrel secured to said stock,

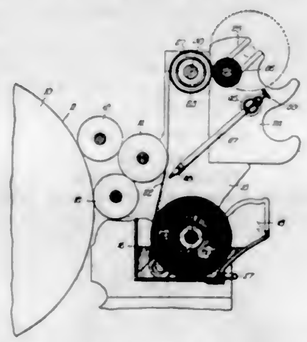
said stock having a chamber therein, means to admit a charge of air into the chamber, means to discharge a charge of air from the chamber, a tube member mounted on said stock and projecting forwardly therefrom, said stock having conduit means therein at one end communicating with said tube and at the opposite end communicating with said chamber, a rifle barrel slidably mounted on said tube member, a magazine tube in said rifle barrel, said rifle barrel having a loading aperture communicating with said magazine tube.

2,101,199
LUMINAIR
Thomas W. Rolph, Newark, Ohio, assignor to Holophane Company, Inc., New York, N. Y., a corporation of Delaware
Application March 14, 1935, Serial No. 11,006
5 Claims. (Cl. 240—93)



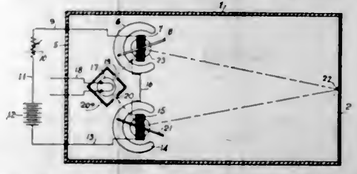
1. A luminair comprising a light source, an open-mouthed reflector about the light source and a prismatic light transmitting member disposed across the mouth of the reflector to intercept direct and reflected light and refractively transmit the same, the reflected light being received by the prismatic member at a different angle from the reflector axis than that of the direct light incident on the same area of the transmitting member, the prisms being of variant refractive power to refract said reflected light to emerge at each point at substantially the same angular divergence from the reflector axis as that of the direct light refracted from said point and on the opposite side of the axis.

2,101,200
CIGARETTE EXTINGUISHER
Henry Roy Spangler, Denver, Colo.
Application September 1, 1936, Serial No. 98,836
2 Claims. (Cl. 131—51)



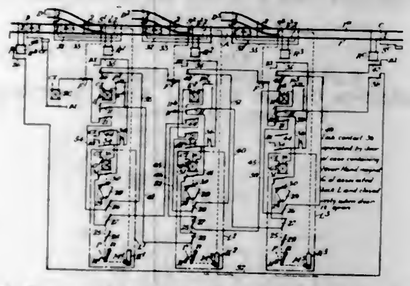
1. A cigarette extinguisher comprising: a metallic tube; a plurality of pointed metallic plates extending within and intersecting each other within said tube so as to divide the burning extremity of a cigarette as it is forced into said tube.

2,101,201
GAME APPARATUS
Carl R. Simpkins, Inglewood, Calif., assignor to J. Frank Meyer, Flintridge, Calif.
Application May 14, 1934, Serial No. 725,455
3 Claims. (Cl. 273—121)



1. In a ball game, a playing field, means disposing said playing field at an angle to the horizontal whereby balls placed thereon will move by gravity over said field, means for projecting balls onto said playing field, means disposed on said playing field forming barriers in the path of movement of balls over said field, ball-throwing means disposed on said field in advance of said barriers for receiving balls and for throwing balls so received over said barrier, means disposed between said barrier and said ball-throwing means engageable by balls moving toward said barrier for actuating said ball-throwing means.

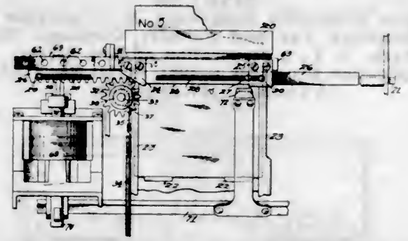
2,101,202
DAMPENING MECHANISM FOR PRINTING PRESSES
Burt D. Stevens, Chicago, Ill., assignor to Miehle Printing Press & Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application May 20, 1936, Serial No. 80,700
21 Claims. (Cl. 101—147)



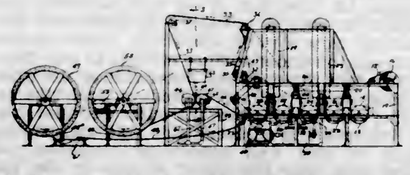
1. In a dampening device, a distributing roller, a movable moisture absorbing medium in contact with said roller, said medium having movement in one direction only from a source of liquid supply to a point of takeup, and means directing a blast of air against said medium in advance of its contact with said roller.

2,101,203
MEASURING INSTRUMENT
Harry A. Toulmin, Jr., Dayton, Ohio, assignor to Business Corners, Inc. of Delaware, Dayton, Ohio, a corporation of Delaware
Application January 21, 1936, Serial No. 60,147
7 Claims. (Cl. 171—95)

1. In combination, means for producing and directing diverging light beams, a pair of rotatable mirrors adapted to receive said beams, a scale for receiving said light beams, and electrical means including a single series electric circuit for simultaneously positioning both said mirrors to adjust the light beams by movements of said beams toward or away from each other on said scale.



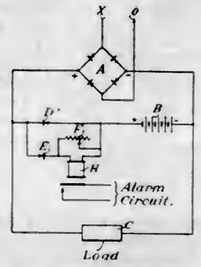
2,101,204
RAILWAY TRAFFIC CONTROLLING APPARATUS
Harry C. Vantassel, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application April 14, 1936, Serial No. 74,256
9 Claims. (Cl. 246—134)



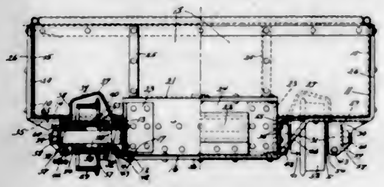
4. In combination, a stretch of railway track including a plurality of switches, a signal adjacent one end of said stretch for governing traffic movements into said stretch in one direction, a relay associated with each switch, means for controlling each relay in such manner that the relay cannot be energized unless said stretch is unoccupied and the remaining relays are all deenergized, and means controlled by said relays for controlling said signal.

2,101,205
WORKMAN'S TIME RECORDER
Edward G. Watkins and James A. Dell, Gardner, Mass., assignors to Simplex Time Recorder Company, Gardner, Mass., a corporation of Massachusetts
Application September 24, 1935, Serial No. 41,924
9 Claims. (Cl. 234—43)

1. In a time recorder, a card chute, a hammer device, actuating mechanism therefor including an electric circuit and a circuit-closing switch, a bar mounted on said chute and having spaced holes therein, and a plunger slidable through any one of said holes when said hole is in a predetermined position, said plunger and bar cooperating to prevent closing of said switch when said plunger is out of alignment with one of said holes.

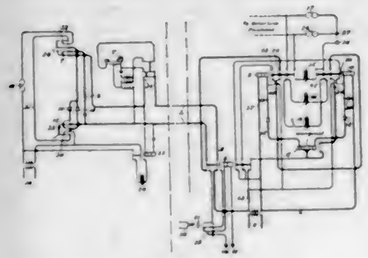


2,101,206
PROCESS OF MAKING RIBBED SEPARATORS
Leland E. Wells, Cleveland Heights, Ohio, assignor to Willard Storage Battery Company, Cleveland, Ohio, a corporation of West Virginia
Application March 19, 1935, Serial No. 11,842
10 Claims. (Cl. 18—48)



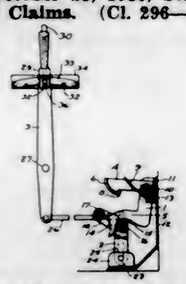
1. The process of making ribbed microporous separators which comprises forming a strip of reticulous rubber gel, and molding ribs thereon from additional reticulous rubber gel and amalgamating the same with the rubber gel strip.

2,101,207
BATTERY CHARGING APPARATUS
Kenneth T. Williamson, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application May 11, 1935, Serial No. 21,046
2 Claims. (Cl. 177—311)



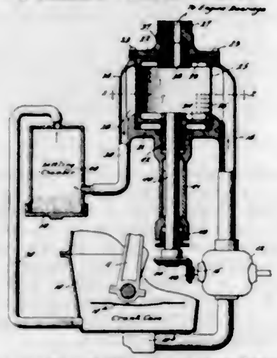
1. In combination with a source of direct current, a load and a battery both connected in multiple with said source, a relay interposed in series with said battery, an indicating circuit controlled by said relay, a rectifier connected in series with said relay and poled to permit current flowing into the battery from the source to energize the relay, and a shunt path around the relay and the first rectifier including a second rectifier poled to permit the flow of current from said battery to said load through such shunt.

2,101,208
MINE CAR
Victor Willoughby, Ridgewood, N. J., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application December 1, 1931, Serial No. 578,272
5 Claims. (Cl. 105—364)



1. In a mine car, a central longitudinally extending floor, opposite side sections extending laterally outward therefrom, each side section comprising a riser, side flooring and side wall, each side flooring having spaced wheel openings adjacent the riser, a plurality of integral wheel frames each comprising, inner and outer pedestal portions for reception of an axle, a wheel hood adapted to extend upwardly through and substantially close a wheel opening, a flange adapted to engage the under surface of the car side flooring adjacent the ends and outer side of the wheel opening, and a pair of spaced vertical ribs extending outwardly from the outer pedestal portion beneath the adjacent side wall constituting a pair of side wall supporting elements, and means attaching the wheel frames to the side flooring.

2,101,209
SIGNALING SYSTEM
Walter Meredith Bacon, New York, N. Y., assignor to American Telephone and Telegraph Company, a corporation of New York
Application July 21, 1934, Serial No. 736,406
2 Claims. (Cl. 175—320)

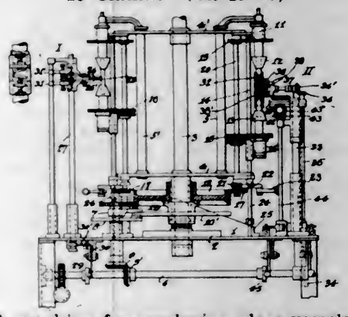


1. In an alarm system, a central station, a substation connected thereto, first and second keying devices at said substation, first and second normally operated relays at the central station corresponding to said substation, means responsive to the operation of the first keying device at the substation for maintaining the corresponding first relay operated and for deenergizing the second relay, means responsive to the operation of the first and second keying devices at the substation for operating the corresponding second relay and for deenergizing the first relay, and means for operating both the first and second relays corresponding to the substation when both the first and second keying devices are unoperated.

2,101,210
COMBINATION LATCH
Wright Barclay, New York, N. Y.
Refiled for abandoned application Serial No. 713,104, filed February 27, 1934. This application filed October 23, 1936, Serial No. 107,630
11 Claims. (Cl. 296—65)

1. A locking device comprising a U shaped latch having a locking projection on the inside of one end thereof, means pivotally mounting said latch and means holding said latch in an open or locked position without having a positive connection thereto, and with play in said holding means, said means also adapted to hold said latch in a neutral position permitting an object to enter said latch, and said latch preventing its being moved therefrom until the latch is opened, said latch characterized in that the end thereof, opposite the end having the locking projection thereon, is freely held by mechanical means, and said mechanical means adapted to be operated from a remote point.

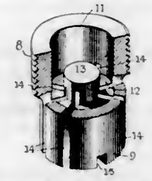
2,101,211
FILTER
Karl B. Britton, Cleveland, Ohio
Application October 30, 1934, Serial No. 750,729
8 Claims. (Cl. 210—167)



1. In apparatus of the character described, the combination of a housing, a filtering medium therein, means for relatively moving the said filtering medium and housing, an inlet for delivering fluid upon successive portions of the filtering medium as relative movement occurs, said housing having a discharge outlet for the filtered fluid, a valve controlled by-pass between the said inlet and the said discharge outlet, means between said inlet and said by-pass for separating out foreign material, said housing being provided with a by-pass outlet for discharging restricted amounts of fluid which has already been filtered through the said filtering medium in a direction to remove material which has previously been deposited thereon.

2,101,212
BOILED EGG OPENER
Camille Coppin, Brussels, Belgium
Application December 15, 1936, Serial No. 116,033
In Belgium December 31, 1935
2 Claims. (Cl. 146—2)

1. A device of the character described including an annular box-like sectional casing, one part of which is releasably engageable with the other, the inner periphery of the casing being provided with a horizontal slot extending entirely thereabout, the outer periphery of the casing being provided with an aperture, an open ring-like resilient member removably arranged within the casing and surrounding the inner periphery of the casing and provided with a series of teeth positioned in proximity to the horizontal slot and grips continuing from the ends of the open ring-like resilient member and projecting through and operable in the aperture, whereby when pressed together the resilient member will be guided by the upper and lower walls of the casing and contracted against the inner periphery of the casing and the teeth thereof projected through the horizontal slot in the casing substantially as and for the purposes set forth.



2,101,213
MACHINE FOR PRODUCING GLASS VESSELS FROM TUBING
Jakob Dichter, Berlin, Germany
Application February 16, 1933, Serial No. 657,084
In Germany May 2, 1932
19 Claims. (Cl. 49—7)

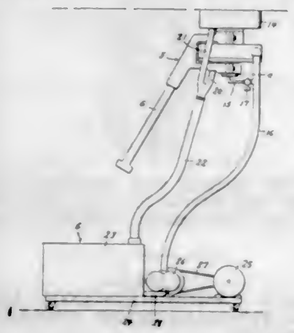
1. A machine for producing glass vessels from glass tubes comprising in combination, pairs of axially superposed tube holders arranged in a circle, means for rotating said holders about their axes, means for moving said pairs of holders about their common centre, concentrically distributed means for heating the glass tubes between the holders of each pair, means for forming spaced constrictions in each tube between the holders and means for blowing out and for molding each tube between the constrictions thereof.

2,101,214
WASP EXCLUDER FOR AIR BRAKES
Terry Everett, Watertown, N. Y., assignor to The New York Air Brake Company, a corporation of New Jersey
Application February 15, 1937, Serial No. 125,864
1 Claim. (Cl. 303—1)

A wasp excluder of the type comprising in one piece an attaching base and an extension having intersecting cross slots, in which the cross slots communicate with an annular bore leading from the end of said base, said bore surrounding a

central hub integral with said base and extension, said hub serving to blank the intersection of the cross slots and to stiffen the slotted extension.

2,101,215
RESINOUS AMINOMETHANOL-AROMATIC AMINE-FORMALDEHYDE CONDENSATION PRODUCTS
George D. Graves and Jesse Harmon, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application November 25, 1936, Serial No. 112,826
10 Claims. (Cl. 260—130)



1. Process of preparing resins soluble at least to the extent of 1 part in 99 parts of 2% aqueous acetic acid which comprises the following steps: adding 81 parts of 37% aqueous formaldehyde to a solution, cooled to 4° C., of 36.4 parts of aniline and 14.6 parts of n-butylamine in 170 parts of 95% ethanol; adding 1 part of phthalic anhydride; heating the mixture for about 24 hours at 65–75° C.; cooling and then adding 60 parts of 37% hydrochloric acid while maintaining the temperature at 20 to 30° C.; heating the mixture at 65 to 75° C. for four hours; diluting with 500 parts of water; adding with agitation an excess of 5% aqueous caustic soda; filtering off the precipitate, washing and drying.

6. A heat-hardening resin soluble to the extent of at least one gram in 99 grams of 2% aqueous acetic acid and insoluble in water and basic solutions, said resin being a condensation product of formaldehyde with a condensation product of a primary aromatic amine $R—NH_2$, wherein R is hydrocarbon, with an aminomethanol from formaldehyde and an aliphatic amine having at least one amino hydrogen atom and in which each radical attached to the amino nitrogen atom has less than seven carbon atoms.

2,101,216
CEILING WASHER
Adolph C. Grueschow, Milwaukee, Wis.
Application November 3, 1936, Serial No. 109,011
1 Claim. (Cl. 15—50)

A washer of the character described comprising a yoke, a handle extending from the yoke, said yoke having substantially parallel extending portions, said extending portions having openings therein, a housing interposed between said extending portions, oppositely projecting tubular members on the housing extending through said openings, a resilient cup-like member on the outer end of one of the tubular members, a drain pipe extending from the housing and through an opening in one of the extending portions to prevent rotation of the housing, a hollow shaft extending through the housing and having its ends journaled in said tubular members, a brush secured to the end of the tubular

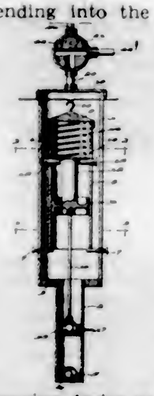
shaft adjacent the cup-like member and in which the brush is located, a fluid driven impeller in the housing secured to the tubular shaft, a fluid inlet for said housing adapted to discharge

fluid against said impeller to rotate the same, a fluid conduit extending to said inlet, and a branch pipe extending from the conduit and through the tubular shaft to terminate in the cup-like member.

2,101,217
PRODUCTION OF DICARBOXYLIC ACIDS AND ESTERS THEREOF
Julian W. Hill and Edgar W. Spanagel, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 29, 1935, Serial No. 3,956
15 Claims (Cl. 260—106)

1. In a process of producing dicarboxylic acids and esters, the steps which comprise treating an alkali metal derivative of a beta-ketonic ester of the general formula

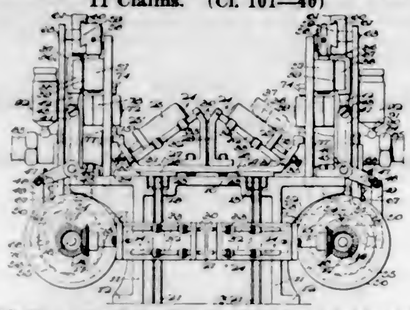
$$R-\overset{\overset{O}{\|}}{C}-CHR_1-COOR_2$$



with a compound having the formula

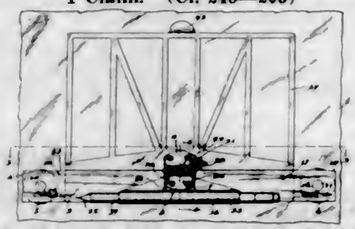
$$X-R_3-X$$

in which R and R_2 represent hydrocarbon radicals, R_1 is a member of the group consisting of hydrogen and hydrocarbon radicals, R_3 represents a divalent hydrocarbon radical containing at least two carbon atoms and in which the terminal carbon atoms are aliphatic in character, and X is a member of the group consisting of chlorine, bromine and iodine, and then reacting the resultant reaction mixture with an alcohol and the corresponding metal alcoholate.



2,101,218
RODLESS PUMP
Walter N. Huff, Harwood, Tex.
Application September 24, 1936, Serial No. 102,423
5 Claims. (Cl. 103—44)

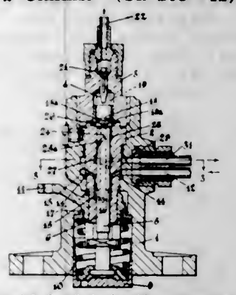
1. In an apparatus for use in raising oil from a well, a well tubing, a suction cylinder of smaller diameter than said well tubing, means forming a fluid tight connection between the upper end of said suction cylinder and the lower end of said well tubing, projections from the lower portion of said well tubing, and a pumping device positioned within the tubing, closed at its upper end and in communication with said tubing at its lower end removably supported by said projections and extending into the suction cylinder



whereby the pumping device as a whole may be removed from said well tubing.

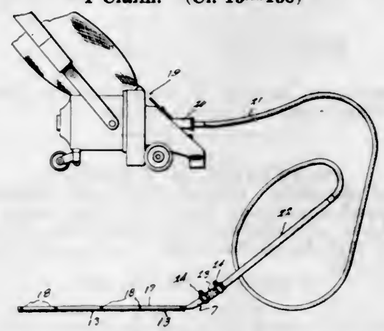
2,101,219
APPARATUS FOR MARKING ARTICLES
Henry Kershaw, Newark, N. J.
Application June 24, 1936, Serial No. 87,069
11 Claims. (Cl. 101—40)

10. In a machine for marking rotatable articles, a traveling support, a pair of spaced shafts rotatably mounted upon the traveling support and having their axes of rotation vertically inclined, rollers mounted upon the shafts and extending radially beyond the same and being spaced for a distance less than the diameter of the rotatable article arranged above and supported thereon, and means to mark the article while being supported by the rollers.



2,101,220
HOLDER
Fred A. Kiser, Lamar, Kans.
Application June 19, 1936, Serial No. 86,204
1 Claim. (Cl. 248—205)

Means for securing a spring controlled clamping element in juxtaposition to a cooperating



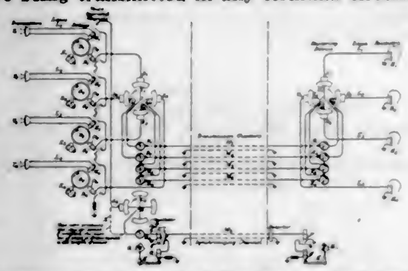
surface, comprising an oblong base member formed intermediate the ends of its rear face with a vertical groove for receiving the lower end of said element, said member being formed on its forward face with spaced oppositely disposed rabbets to provide said member with reduced end terminal portions, means on the forward faces of said end terminal portions for detachably securing said member directly against said surface, and said groove gradually increasing in depth from its lower to its upper end.

2,101,221
LIQUID FUEL PUMP
Rudolf L'Orange, Stuttgart, Germany, assignor of one-half to Frederick Richard Simms, London, England
Application April 20, 1933, Serial No. 667,125
In Germany December 5, 1932
2 Claims. (Cl. 103—41)

1. In a liquid fuel injection pump of the type in which the output is varied by by-passing fuel from the pump chamber at the end of the injection stroke, the combination comprising a cylinder, a plunger reciprocable therein, suction and spill passages formed distinct from one another, the suction passage being disposed interiorly of said plunger and communicating with the exterior of said plunger through at least one lateral suction passage therein, means for closing said suction passage during a portion of the stroke of said plunger, said spill passage being disposed wholly exteriorly of said plunger and being constituted by one part formed in the outer surface of said plunger and another part formed in the wall of said cylinder, one of said parts of said spill passage comprising a groove extending down to a discharge chamber for the spill fuel in said cylinder wall, said groove having a closed end cooperating with said another part of the spill passage to control the spill, said another part of the spill passage being in constant communication with the pump chamber, a discharge chamber for the spill fuel in said cylinder wall extending substantially completely around said plunger and arranged to be in constant communication with said spill groove, and an inlet chamber for the fuel supply also in said cylinder wall and extending substantially completely around said plunger and communicating to supply fuel to said suction passage formed interiorly of said plunger through said lateral suction passage therein, said discharge chamber for the spill fuel being arranged in said cylinder wall above said inlet chamber for the fuel supply so as to maintain the spill fuel entirely separate from the suction fuel and so that any spill fuel leaking from said discharge chamber will be caught underneath in said inlet chamber, the arrangement being such that a complete uniflow action of the fuel in said pump is obtained by maintaining the suction and spill fuels entirely separate from one another in their passage respectively to and from the pump chamber.

2,101,222
VACUUM CLEANER APPLIANCE
Leonard Oren McCracken, North Little Rock, Ark.
Application February 18, 1936, Serial No. 64,553
1 Claim. (Cl. 15—158)

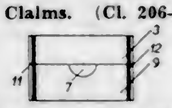
An appliance for vacuum cleaners comprising an elongated shallow narrow nozzle, a removable closure at one end of the nozzle, elongated members provided along the longitudinal edges of the nozzle, a transversely extending member across the outer end of the closure, said elongated members and transverse member being provided with depending bristles, and a continuous retaining band secured to the outsides of the said elongated members and transverse member for holding the same intact with the nozzle and the closure against displacement.



2,101,223
CHEMICAL PROCESS
Joseph Grange Moore, Runcorn, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application September 7, 1935, Serial No. 39,625. In Great Britain September 24, 1934
6 Claims. (Cl. 260—1)

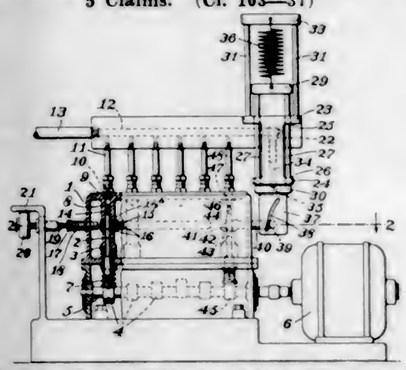
1. Process for stabilizing chlorinated rubber which comprises emulsifying a solution of chlorinated rubber in carbon tetrachloride with an aqueous solution of sodium bisulfite, and separating the chlorinated rubber from the liquid components.

2,101,224
PRIVACY SYSTEM
Harold Smith Osborne, Upper Montclair, and Sumner Bisbee Wright, South Orange, N. J.; said Osborne assignor to American Telephone and Telegraph Company, a corporation of New York, and said Wright assignor to Bell Telephone Laboratories, Inc., a corporation of New York
Application March 7, 1936, Serial No. 67,722
18 Claims. (Cl. 179—1.5)



1. In a signaling system, a plurality of terminal circuits, a plurality of transmission channels, one connected to each terminal circuit, switching means for simultaneously interchanging the connections between the terminal circuits and the transmission channels, said means operating to produce such interchange only when no signals

are being transmitted in any terminal circuit or

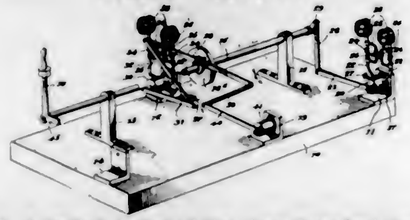


transmission channel of the system and before the transmission of signals begins.

2,101,225
PRODUCTION OF WRAPPERS
Adolf Rambold, Dresden-Laubegast, Germany
Original application May 31, 1935, Serial No. 24,416. Divided and this application October 31, 1935, Serial No. 47,692. In Germany April 13, 1935
2 Claims. (Cl. 206—46)

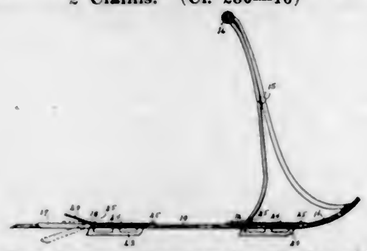
1. The combination with a bag having a holder string and attached label, of a wrapper comprising a rectangular blank having top and bottom parts folded over about the bag and string into relatively overlapped relation, with only part of the label projecting from the overlap, and the lateral edges of the folded blank crimped together.

2,101,226
LEAKAGE COMPENSATOR FOR PUMPING SYSTEMS
Alfred Sonntag, Moline, Ill., assignor, by mesne assignments, to American Machine and Metals, Inc., New York, N. Y., a corporation of Delaware
Application December 3, 1935, Serial No. 52,714
5 Claims. (Cl. 103—37)



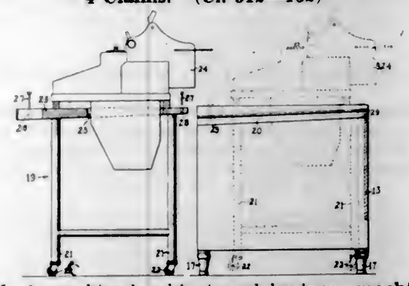
1. In an hydraulic system adapted for use with testing machines, a primary impeller for introducing liquid into the system at a predetermined rate, an auxiliary impeller, a template shaped to bear a definite relation to the leakage curve of the system means responsive to the pressure in the system for imparting movement to said template, and means so operated by the movement of the template as to cause said auxiliary impeller to introduce additional liquid into the system to compensate for that lost through leakage.

2,101,227
POLYCARBOXYLIC ACID ESTERS OF POLYUNSATURATED HIGHER ALCOHOLS
James H. Werntz, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 13, 1935, Serial No. 35,972
13 Claims. (Cl. 260—103)



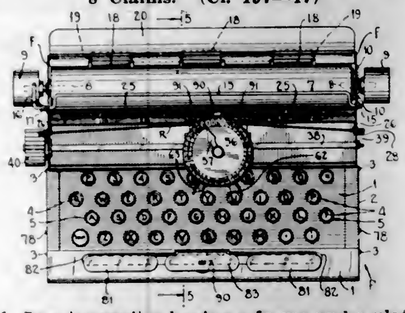
1. An ester of a polycarboxylic acid wherein the hydrogen atom of at least one carboxyl group is replaced by the polyunsaturated hydrocarbon radical of an alcohol obtainable by the carboxyl reduction of the acid radicals of China-wood oil.

2,101,228
TESTING MACHINE FOR SHOCK ABSORBERS AND THE LIKE
Louis E. Willard, Dallas, Tex., assignor of fifty-one percent to John M. Hanford, Dallas, Tex.
Application May 8, 1936, Serial No. 78,695
6 Claims. (Cl. 73—51)



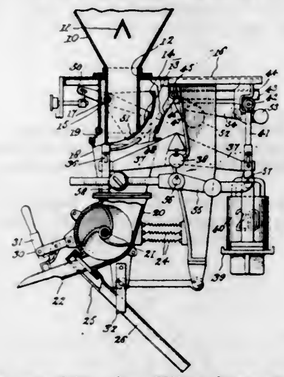
1. A testing device of the class described comprising a base, an operating shaft, a plurality of testing cylinders arranged upon opposite sides of the shaft, crank means connected to the testing cylinders for building up pressure within the cylinders as said shaft is actuated, gage means carried by each cylinder for indicating the pressure built up in the cylinders, means for regulating the pressure within one cylinder whereby the pressure built up in both cylinders may be indicated as being uniform upon the gages, and means for forming a detachable connection between a device to be tested and said operating shaft for causing the resistance in the device being tested relative to one of the first mentioned cylinders to be registered upon the gages associated with the last mentioned cylinder.

2,101,229
ICE OR SNOW SCOOTER
Roland O. Anderson and Clair H. Anderson, Des Moines, Iowa
Application August 27, 1936, Serial No. 98,150
2 Claims. (Cl. 280—16)



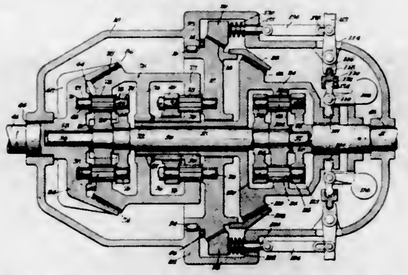
1. In a device of the class described, a ski portion having two slot openings, a skate runner extending downwardly through each of said slot openings, a means for securing said skate runners to said ski portion, and a handle member operatively secured to said ski portion.

2,101,230
COMBINED CABINET AND BUSINESS MACHINE STAND
Walter A. Anderson, Bridgeport, Conn., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application June 5, 1936, Serial No. 83,681
4 Claims. (Cl. 312—162)



1. A combined cabinet and business machine stand comprising a cabinet having spaced banks with tops and a connector between the banks, means rendering each bank self-supporting, a business machine stand having a frame and feet by which it is self-supporting and having means at the top for mounting a business machine and for engaging guide means on the spaced banks, and said guide means so related with the banks as to permit the stand to be slidably moved into an elevated position of use between the tops of the banks.

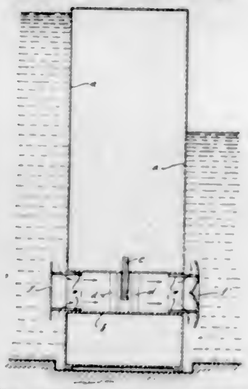
2,101,231
TYPEWRITER
Thomas Raymond Arden, Baldwin, N. Y., assignor to Nic Projector Corporation, New York, N. Y., a corporation of New York
Application December 21, 1935, Serial No. 55,608
8 Claims. (Cl. 197—47)



1. In a typewriter having a frame and a platen, a shaft mounted in said frame, a carriage mounted on said shaft, said carriage being rockable in unison with said shaft and said shaft being turnable relative to said carriage, said carriage being longitudinally slidable relative to said shaft, a movable printing member located on said carriage and having a plurality of characters thereon, and connecting mechanism intermediate said shaft and said printing member, said connecting mechanism being adapted to actuate said printing member when the shaft is turned, so as to bring a selected character of said printing member into printing position relative to said platen.

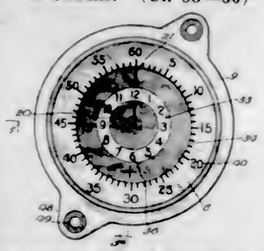
2,101,232
FILLING MACHINE
Johann Georg Ferdinand Augustin, Krefeld, Germany, assignor to Verpackungsbedarf G. m. b. H., Krefeld, Germany
Application December 23, 1935, Serial No. 55,912
In Germany January 13, 1934
4 Claims. (Cl. 249—61)

1. In a machine for filling bags and similar receptacles, a supporting frame, a storage bin secured to said frame and having a discharge mouth, a balance bearing arranged at said frame, a scale beam resting in said balance bearing, a feeding hopper suspended from one end of said scale beam, rotary impelling means having an electric motor arranged at said feeding hopper, flexible means for connecting said feeding hopper and said electric motor to said frame, means for supporting the filling receptacle, said means including a tube tapering from said feeding hopper, clamping means supported above said tube for clamping the receptacle onto said tube, pins secured to said feeding hopper and secured to said frame, and links engaging said pins for forming parallel guides adapted to prevent the feeding hopper from swinging.



2,101,233
VARIABLE TRANSMISSION MEANS
Charles Bancroft, New Canaan, Conn.
Application March 6, 1937, Serial No. 129,329
12 Claims. (Cl. 74—260)

1. A device of the character described, including, in combination, a stator, an input shaft and an output shaft rotatably mounted in said stator, an intermediate shaft in said stator and arranged coaxially with said other shafts, a hub secured to said input shaft, planetary gears rotatably mounted in said hub, a sun gear on said intermediate shaft and meshing with said planetary gears, a frame rotatably mounted on said

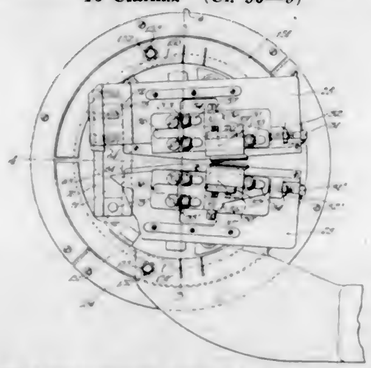


intermediate shaft, gearing on said frame meshing with said planetary gears, a fulcrum member, gears rotatably mounted in said fulcrum member and associated with said frame, another frame associated with said fulcrum member and having a gear therein, a second sun gear on said intermediate shaft, a hub secured to said output shaft, planetary gears rotatably mounted in said hub and meshing with said second sun gear and said gear on last-mentioned frame.

2,101,234
SLUICE GATE
Theodor Becher, Wiesbaden, Germany, assignor to Maschinenfabrik Augsburg-Nurnberg A. G., Nuremberg, Germany, a corporation of Germany
Application January 18, 1936, Serial No. 59,775
In Germany January 18, 1935
4 Claims. (Cl. 61—22)

1. In sluice gates having passageways transversely extending therethrough, in combination with the outer walls of the gate, guide elements spaced a short distance away from said outer walls in front of the ends of said passageways for transversely deflecting the flow of water while entering, and emerging from, said passageways, and means provided on the gate structure for supporting said guide elements in position.

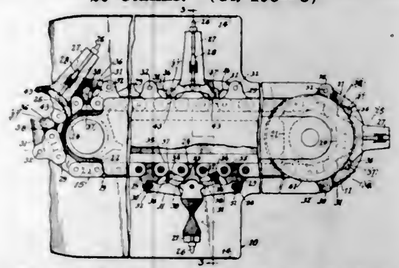
2,101,235
CLOCK
Gordon Miller Buehrig, Auburn, Ind., assignor to Auburn Automobile Company, Auburn, Ind., a corporation of Indiana
Application September 24, 1935, Serial No. 41,888
5 Claims. (Cl. 58—50)



4. A clock comprising in combination, an open front casing having clock-operating mechanism in the rear portion thereof and provided with an opaque plate in front of the mechanism and spaced inwardly from the front thereof, an opaque ring mounted in the casing in front of the plate, a transparent dial disposed in front of the ring and having around the outer portion thereof and adjacent to the inner edge of the ring, a minute scale and also having a separate hour scale within the minute scale, minute- and hour-hands positioned between the plate and ring and connected for movement by the mechanism, and window means in the casing for admitting light into the space between said plate and ring for dial illuminating purposes.

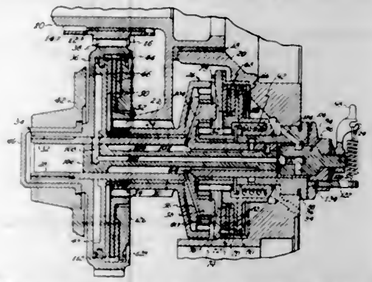
2,101,236
CARTRIDGE-EJECTING MECHANISM FOR FIREARMS
Frank F. Burton, Mount Carmel, Conn., assignor to Winchester Repeating Arms Company, New Haven, Conn., a corporation of Maryland
Application November 28, 1934, Serial No. 755,206
6 Claims. (Cl. 42—25)

1. In a firearm, the combination with a reciprocating breech-bolt; of an ejector-member carried by the said breech-bolt with freedom for both lateral and longitudinal movement with respect to the said breech-bolt; and cam-like spring-actuated ejector-operating means carried by a normally-stationary part of the firearm and engageable with the said ejector-member upon the retiring movement of the said breech-bolt and constructed and arranged to impart to the said ejector-member a combined forward-and-lateral cartridge-ejecting movement.



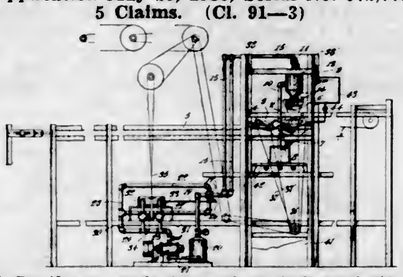
2,101,237
MACHINE FOR PRODUCING GEARS
Leonard O. Carlsen, Rochester, N. Y., assignor to Gleason Works, Rochester, N. Y., a corporation of New York
Application September 9, 1935, Serial No. 39,675
16 Claims. (Cl. 90—9)

3. In a gear cutting machine, a support, a ram reciprocable in said support, a slide reciprocable on said ram in a direction at an angle to the direction of reciprocation of said ram, a rotatable crank-shaft, means operatively connecting the crank-shaft to said slide to reciprocate the same to effect cutting and return strokes of said slide,



a cam secured to said crank-shaft and operatively connected to said ram to reciprocate the same to move the tool slide to and from cutting position at opposite ends of its stroke, means for rotating said shaft, and means for moving said shaft bodily to effect depthwise feed movement of the tool.

2,101,238
GATHERING OR PICK-UP CONVEYER
Frank Cartlidge, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application November 10, 1934, Serial No. 752,431
Renewed May 6, 1937
20 Claims. (Cl. 198—8)

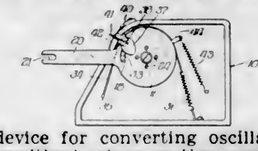


1. In a gathering conveyer, a pan, a gathering mechanism movable along said pan including an orbitally movable continuous chain having a plurality of flights, pivotally mounted thereon and adapted to extend laterally therefrom while moving along said pan, means for permitting said flights to fold rearwardly along said chain at one end of said pan, and means for holding said flights in a laterally extended position with respect to said chain at the other end of said pan comprising a rotatable disk, and engaging abutments extending inwardly and laterally from said flights on opposite sides of the center lines thereof for engagement with said disk.

2,101,239
SUPERCHARGER DRIVE
Roland Chilton, Ridgewood, N. J., assignor, by mesne assignments, to The Reed Propeller Co., Inc., Garden City, N. Y., a corporation of New York
Application August 14, 1934, Serial No. 739,765
7 Claims. (Cl. 74—290)

1. The combination with a supercharger layshaft, of a pinion rotationally free from said shaft, a supercharger driving gear upon said shaft, a sun gear rotationally free upon the shaft, an annular gear rigid with the pinion, planet pinions engaging the last said gears, a clutch means adapted to lock the sun gear against rotation, a second clutch means adapted to lock the layshaft pinion to the layshaft, and means to engage either of said clutches and adapted to disengage both.

2,101,240
METHOD AND APPARATUS FOR COATING CONFECTIONS
William S. Cloud, Wilmette, Ill.
Application May 25, 1933, Serial No. 672,775
5 Claims. (Cl. 91—3)



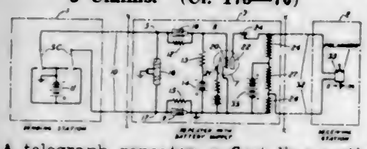
5. In the manufacture of coated confections, the method of handling glazing syrups which tend to crystallize when agitated which comprises circulating the syrup in an endless path, applying reduced pressure to said syrup during a portion of its travel and utilizing the difference between said reduced pressure and atmospheric pressure to accomplish said circulation, and causing said syrup to pass over the confections to be coated during a portion of its travel when said reduced pressure is not applied.

2,101,241
LUBRICATING OILS
Joseph Cole, Whiting, Ind., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
No Drawing. Application September 30, 1936, Serial No. 103,365
4 Claims. (Cl. 87—9)

1. A method of making an anti-oxidant comprising reacting chlorinated paraffin wax and oleic acid with anhydrous aluminum chloride, reacting the product of this reaction with lime, and recovering an anti-oxidant product by distillation from the resulting mixture.

2,101,242
CLUTCH
Sarah M. Crewdson, Chicago, Ill., assignor of nineteen-thirtieths to Robert H. Goodhart and three-thirtieths to Herman M. Soloway, Chicago, Ill.
Original application April 15, 1935, Serial No. 16,362. Divided and this application August 8, 1935, Serial No. 35,230
7 Claims. (Cl. 74—142)

1. A device for converting oscillating motion into intermittent rotary motion comprising a rotatable shaft, a clutch member of generally cup-shape fixed thereto and rotating therewith, a clutch ring having rotation independently of the clutch member and positioned adjacent thereto,



clutch rollers carried by said ring and located within the member, resilient means yieldingly biasing said ring in a direction to hold the ring against a stop, and means within the member having oscillating motion, said means being operative to cam the rollers into engagement with the internal periphery of the clutch member when oscillated in a direction opposite to the direction in which the clutch ring is yieldingly biased.

2,101,243

TELEGRAPH SIGNAL REPEATING SYSTEM

George C. Cummings, Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application June 11, 1935, Serial No. 26,030
5 Claims. (Cl. 178—70)

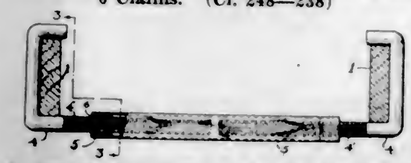
1. A telegraph repeater, a first line section, a second line section, said repeater including thermionic space discharge amplifying means having an input side and an output side, capacity means having a leak path for impressing polar signal impulses from said first line section upon said input circuit, a balancing bridge circuit for impressing the impulses from said output circuit directly upon said second line section as polar impulses with substantially the same wave shape as in said input circuit.

2,101,244

PISTON RING

Charles Curtis, Chicago, Ill., assignor of twenty-five percent to Fred A. Luthy and twenty-five percent to Deborah R. Luthy, Jackson, Mich.

Application November 15, 1933, Serial No. 698,029
Renewed July 9, 1937
2 Claims. (Cl. 309—41)



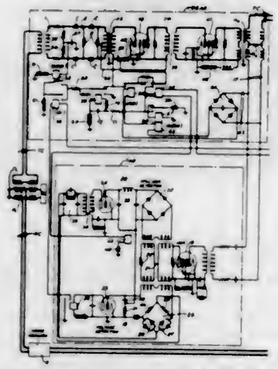
1. A one piece piston ring formed with a plurality of circumferentially spaced slots therein, a plurality of individual spring members mounted thereon and formed with reduced end sections adapted to be accommodated in said slots, and shoulders on the springs to form a bearing against the inner face of the ring.

2,101,245

STEPLADDER ATTACHMENT

Anthony De Franco, Euclid, Ohio

Application July 5, 1935, Serial No. 29,892
6 Claims. (Cl. 248—238)



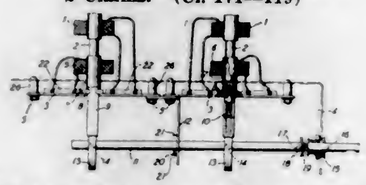
6. An attachment for a step ladder, comprising end members with transversely arranged shank arms and a single intermediate member having co-axially rotatable extensible engagement with the corresponding shank arms of the end members, said end members being adapted for clamping engagement with the inclined sides of a step ladder, and said intermediate member being adapted to support a scaffold.

2,101,246

TRANSMISSION CONTROL IN SIGNALING SYSTEMS

Alton C. Dickieson, Hollis, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application March 28, 1936, Serial No. 71,406
13 Claims. (Cl. 179—170)



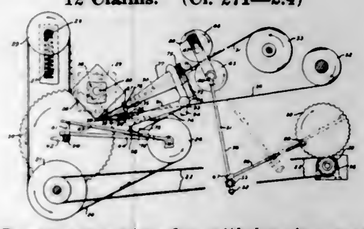
13. A control circuit for a two-way signaling system including at each terminal thereof a signal transmitting path and a signal receiving path each including a wave amplifier, comprising means responsive to variations in the amplitude level of the signals in one of the paths at said one terminal to control the gain of the amplifier therein, and auxiliary means directly responsive to the gain setting of said amplifier in said one path to cause the gain of said amplifier to be increased when below a given value.

2,101,247

AMPLIFIER COUPLING CIRCUITS

Charles William Earp, Aldwych, London, England, assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application February 28, 1935, Serial No. 8,602
In Great Britain July 23, 1934
2 Claims. (Cl. 171—119)



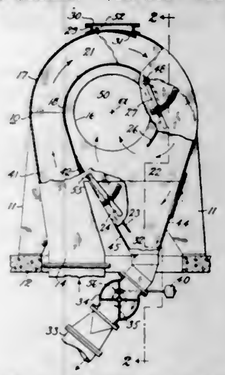
1. In a superheterodyne radio receiver, a plurality of adjustable intermediate frequency transformers each comprising a fixed winding, a movable winding, a rod axially supporting the fixed winding, a sleeve slidably mounted on the rod and axially supporting the movable winding, and a saddle-shaped member attached to said sleeve, a narrow mounting strip extending through the saddle-shaped members and having the rods mounted thereon and a driving mechanism operating on all of said saddle-shaped members in unison to simultaneously vary the spacing and consequently the electro-magnetical coupling of the fixed and movable windings.

2,101,248

APPARATUS FOR WINDING MATERIAL

Erwin E. Franz, Cranford, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Original application February 9, 1935, Serial No. 5,743. Divided and this application December 11, 1935, Serial No. 53,960
12 Claims. (Cl. 271—2.4)



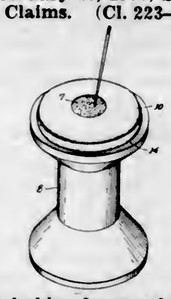
1. In an apparatus for withdrawing material from a continuous supply thereof in a sequence of more than two successive portions of predeterminedly and unidirectionally varying length and having means to advance the material step by step, means to predeterminedly and unidirectionally vary the length of more than two successive steps comprising a reciprocable member to actuate the advancing means, means to drive the member in reciprocation, and means interposed between the driving means and the member operating to unidirectionally alter the excursion of the member.

2,101,249

PNEUMATIC CLASSIFIER

Martin Frisch, New York, N. Y., assignor to Foster Wheeler Corporation, New York, N. Y., a corporation of New York

Application March 30, 1932, Serial No. 601,916
6 Claims. (Cl. 209—144)



4. A classifier comprising a casing arranged to provide a smoothly curving passage about a horizontal axis discharging in a vertically downward direction into an expansion chamber in the casing, the classifier having an outlet disposed above the expansion chamber, the walls defining the curving passage being arranged so as to prevent the collection of material in flowing through the passage to the outlet and to prevent the passage of separated material into or through the normal path of flow through the classifier to the outlet, one of the walls defining the passage having an air opening, means comprising a damper operative to control said air opening and the flow area of the passage to vary the proportion of material and air flowing through the passage, and means comprising a damper conforming substantially to the curvature of a wall of the passage for controlling the flow area of said passage to control the velocity of flow of material therethrough and into the expansion chamber to thereby control the degree of separation of material from the stream flowing through the passage.

2,101,250

SPOOL NEEDLE CUSHION

Frederick Goertz, South Orange, N. J.

Application February 17, 1937, Serial No. 126,139
12 Claims. (Cl. 223—109)

1. A needle holder for spools, comprising reversely cupped telescopically engaged centrally perforated discs, needle cushion material over the central perforations of said discs and a spring loop having outwardly angled ends located between said cupped discs.

2,101,251

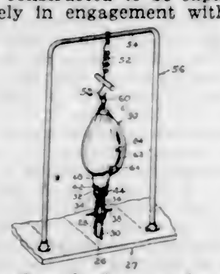
PIGMENTING FIBROUS MATERIALS

Ernst Götte and Walter Kling, Chemnitz, Germany, assignors, by mesne assignments, to Böhme Fettchemie - Gesellschaft mit beschrankter Haftung, Chemnitz, Germany

No Drawing. Application June 30, 1934, Serial No. 733,332. In Germany July 1, 1933
14 Claims. (Cl. 8—20)

1. The process of pigmenting fibrous materials comprising applying to such materials a pigment sorbed by an electro-neutral composition composed of a positively charging organic emulsifying agent containing at least one alkyl radical having at least eight carbon atoms and a negatively charging organic emulsifying agent containing an aliphatic radical having at least eight carbon atoms.

2,101,252



APPARATUS FOR MOLDING AND ORNAMENTING RUBBER ARTICLES

Roland H. Guinzburg, Flushing, N. Y., assignor to I. B. Kleinert Rubber Company, New York, N. Y.

Application August 14, 1935, Serial No. 36,140
14 Claims. (Cl. 18—19)

1. Apparatus for molding and vulcanizing vulcanizable objects comprising a form having a contour corresponding to the desired contour of the finished object, a first flexible member for

reception over the form and the object positioned thereon and constructed to be capable of being pressed closely in engagement with the object

when positioned on the form, and a second flexible member of sheet material for pressing said first flexible member in close engagement with said object substantially throughout the extent thereof.

2,101,253

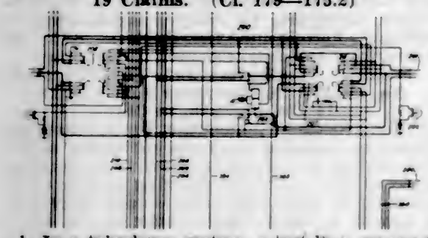
PROCESS FOR PRODUCING ARTIFICIAL THREADS, FIBERS, AND THE LIKE

Martin Günther and Johann Eggert, Berlin, Germany, assignors to "Patentverwertung Dr. Martin Günther G. m. b. H.", Berlin, Germany, a corporation of Germany

No Drawing. Application October 19, 1935, Serial No. 45,831. In Germany October 20, 1934

6 Claims. (Cl. 260—10)

1. In a process for disintegrating straw containing cellulose, the continuous steps of preboiling corn straw under a pressure from 4 to 10 atmospheres with a previously used alkaline lye, of steaming the preboiled straw under pressure after a removal of the lye, of after-boiling the straw with a fresh alkali and of employing the alkali of said after-boiling for preboiling a further quantity of corn straw.



2,101,254

TESTING CIRCUIT

Alfred E. Hague, West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

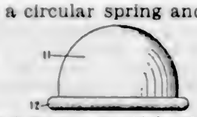
Application September 16, 1936, Serial No. 101,041

19 Claims. (Cl. 179—175.2)

1. In a telephone system, a test line, means for successively establishing a plurality of test conditions in said test line, means for normally maintaining each of said conditions for predetermined periods of time, and means to independently curtail any one or more of said periods.

2,101,255

METHOD OF MAKING PESSARIES



Rene M. Hay, New York, N. Y., assignor to Durex Products, Inc., a corporation of New York

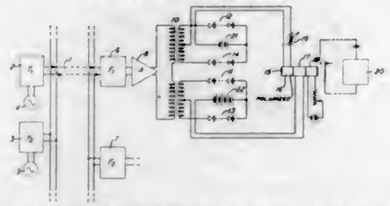
Application March 1, 1930, Serial No. 432,306

Renewed January 14, 1937

10 Claims. (Cl. 18—59)

8. In the process of fabricating a pessary, the step of rolling the marginal portion of a sheet of rubber about a circular spring and then vulcan-

izing said sheet upon a mold having the desired size and shape of the finished pessary.



2,101,256

CARRIER TELEGRAPH RECEIVER

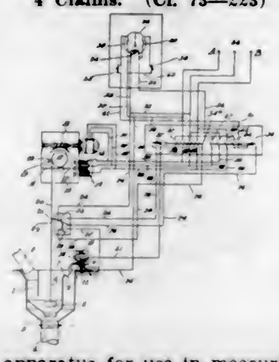
Theodore A. Jones, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application December 29, 1934, Serial No. 759,636

6 Claims. (Cl. 178—66)

1. In a signaling system in which the received signals are subject to variations in strength, a signal input circuit, a signal receiving circuit comprising two response elements both individually coupled to receive simultaneously signal energy from said input circuit, said elements having a substantially constant difference in response over a range of signal strength, and a receiver responsive to the difference in response of said elements whereby received signals of varying strength within said range affect said receiver substantially alike.

2,101,257



APPARATUS FOR MEASURING LIQUID OR FLUENT MATERIALS

Mikael Vogel-Jorgensen, Frederiksberg, near Copenhagen, Denmark, assignor to F. L. Smidth & Co., New York, N. Y., a corporation of New Jersey

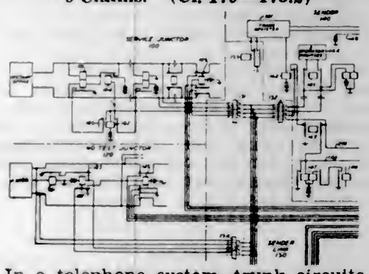
Application August 17, 1935, Serial No. 36,659

In Great Britain August 18, 1934

4 Claims. (Cl. 73—223)

1. An apparatus for use in measuring liquids or fluent materials comprising a measuring vessel into which the material flows, such vessel having an outlet for the material, a valve member for controlling the outlet, an electrically driven mechanism for actuating the valve member, a

control circuit for initiating the operation of said mechanism to cause the valve member to close the outlet, means to stop said mechanism as the outlet is closed, a second circuit and connections for effecting operation of said mechanism in reverse to open the outlet, means actuated by accumulation of material in the vessel to close the last named circuit and cause said mechanism to move the valve member to open the outlet, a clock device, means independent of said mechanism controlled by the closure of the valve member to start the clock device, and means actuated by the accumulation of material in the vessel to stop the clock device.



2,101,258

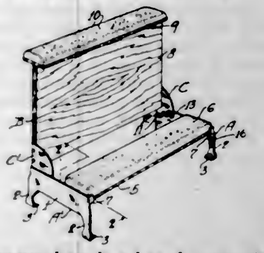
TELEPHONE SYSTEM

Franklin A. Korn, Elizabeth, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application March 11, 1936, Serial No. 68,255

9 Claims. (Cl. 179—175.2)

1. In a telephone system, trunk circuits of a plurality of types, registering means, means for associating said registering means with one of said trunk circuits, means in said registering means to distinguish between types of said trunk circuits, means for controlling the establishment of connections with idle lines, other means for controlling the establishment of connections with lines whether busy or idle, means for connecting one of said control means with one of said registering means, and means in said connecting means, operated in accordance with said distinguishing means for permitting the connection of said registering means with one of said other control means only.



2,101,259

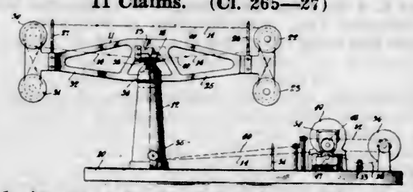
PRAYER BENCH

Argo E. Landau, St. Louis, Mo., assignor to Royal Bond, Inc., St. Louis, Mo., a corporation of Missouri

Application August 26, 1936, Serial No. 97,953

2 Claims. (Cl. 155—166)

1. In a prayer-bench, a bench comprising a pair of spaced rigid end-members and a cross-member constituting a knee-rest fixed to, and extending between, the end-members at their forward margins in spaced relation upwardly from their lower margin, an arm-rest structure comprising a panel having hinged connection at its lower margin between the end-members adjacent the rear margins of said end-members for swingable movement both inoperatively rearwardly and forwardly under, and operatively rearwardly and upwardly from, the knee-rest, and co-operable means on the end-members and panel for releasably securing the panel in upwardly swung operative position, said panel having a width less than the distance between, and when in folded inoperative position being disposed intermediate, said end-members.



2,101,260

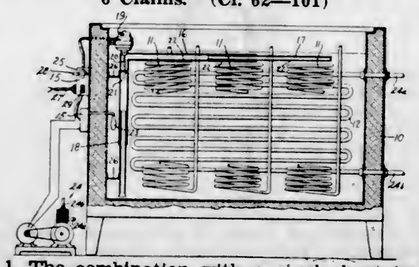
APPARATUS FOR DETERMINING VARIATIONS IN THICKNESS OF THREAD

Hans P. Luhn, New York, N. Y.

Application February 19, 1935, Serial No. 7,304

11 Claims. (Cl. 265—27)

1. An apparatus for determining differences in thickness in portions of thread or the like, comprising means for simultaneously supporting successive portions of equal length of an unbroken thread, means for comparing the weights of said portions, and means controlled by said comparing means for indicating variations in weight of said portions.



2,101,261

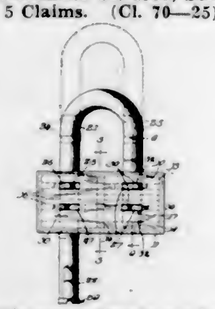
REFRIGERANT SYSTEM AND APPARATUS

Michael A. Martin, Erie, Pa.

Application September 24, 1935, Serial No. 41,911

6 Claims. (Cl. 62—101)

1. The combination with a single heat insulated cabinet, a liquid container in the cabinet, means for cooling said container comprising a liquid heat transfer agent substantially immersing the container, of means effecting circulation of the heat transfer liquid comprising a tube of a substantially uniform diameter having an open end adjacent the cabinet base and a perforated horizontally extending portion immersed by said heat exchange liquid, and disposed a substantial distance upwardly from the cabinet base, and motor operable impeller means within the tube whereby the heat exchange liquid may be circulated through the tube from one portion of the cabinet to another portion, to maintain a substantially uniform temperature of the heat exchange liquid throughout the cabinet.

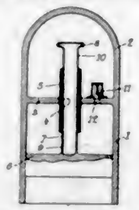


2,101,262
CELLULOSE ETHERIFICATION
Robert W. Maxwell, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application February 23, 1935, Serial No. 7,850
12 Claims. (Cl. 260—152)

1. Process for the preparation of low substituted methyl cellulose, which comprises steeping 80 parts of cellulose in solid form in 400 parts of 21% sodium hydroxide solution to which has been added 102 parts of sodium methyl sulfate, for one-half hour, pressing the steeped cellulose to a weight of 216 parts, maintaining the same for 96 hours at 30° C. and washing with tepid water.

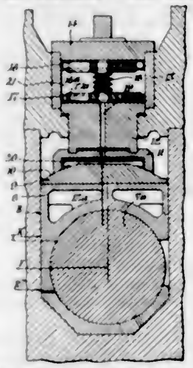
2,101,263
CONTINUOUS PREPARATION OF CELLULOSE DERIVATIVES
Robert W. Maxwell, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 1, 1935, Serial No. 34,133
19 Claims. (Cl. 260—152)

1. Process for the preparation of cellulose ethers which comprises continuously impregnating cellulose in sheet form with aqueous caustic alkali and an etherifying agent, the sheet being impregnated with the caustic alkali at least as soon as with the etherifying agent, continuously pressing out excess thereof, and allowing the thus impregnated sheet to react, and then stopping the reaction.



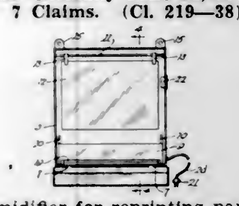
2,101,264
PADLOCK
George F. Mayer, Chicago, Ill.
Application December 21, 1935, Serial No. 55,536
5 Claims. (Cl. 70—25)

1. A padlock comprising in combination a casing consisting of a pair of members in telescopic arrangement with each other, having registering openings in two of the sides of said casing at one end thereof and at one side only at the opposite end, a frame in said casing, a plurality of sliding tumblers mounted in said frame on each side thereof and a shackle extending through said casing having long and short ends, the said shackle having tumbler slots formed in both the long and short ends thereof.



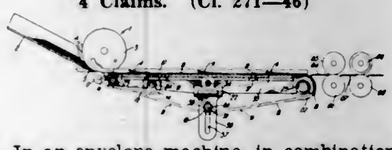
2,101,265
SHOCK ABSORBER
Jean Mercier, Neuilly-sur-Seine, France
Application December 26, 1934, Serial No. 759,204
In France January 9, 1934
10 Claims. (Cl. 267—64)

1. In a damping device between two elements movable with relation to each other and connected by an elastic connection adapted to maintain said elements in an initial relative position at a predetermined distance from each other when at rest and to bring again said elements at the same distance when they have been moved towards and away from each other, in combination: a container, fluid compressing means provided with two opposite walls operatively connected with said two elements and adapted to be moved towards and away from each other, com-



municating means between said container and said fluid compressing means, whereby said fluid compressing means is adapted to discharge fluid into said container and to receive fluid from said container when said elements are moved with relation to each other, and intercepting means adapted to close said communicating means after a predetermined relative displacement between said elements from their initial relative position and to again open said communicating means as soon as said elements are returning towards their initial relative position.

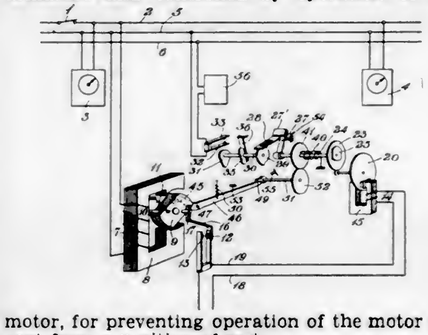
2,101,266
ROLLING MILL
Joseph J. Munson, Houma, La.
Application January 12, 1935, Serial No. 1,457
11 Claims. (Cl. 308—9)



1. In a device of the character described, the combination with a fixed frame provided with spaced vertical guide surfaces, of a mill roll rotatable about a tiltable axis, a bearing block rotatably engaging said mill roll and slidably engaging said spaced parallel guide surfaces, said mill roll being in journalling rotatable engagement with said bearing block and subject to a lateral journal pressure substantially normal to one of the guide surfaces, and means operating downwardly on said bearing block between said guide surfaces for counteracting the upward tilting movements of said mill roll, said bearing block being provided on the side exposed to said journal pressure with a downward extension in slidable engagement with said one of the guide surfaces above and below the axis of said mill roll.

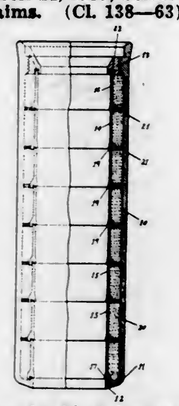
2,101,267
HUMIDIFIER
Edmund Nestler, Dresden, Germany
Application May 15, 1936, Serial No. 79,880
In Germany June 11, 1935
7 Claims. (Cl. 219—38)

1. A humidifier for reprinting paper comprising a box-shaped container, a cover forming the front wall of said container, horizontal rods within said container, detachable clips for suspending reprinting paper sheets severally on said rods, and a removable water trough within said container and below the reprinting paper sheets when the same are suspended within the container for storing and evaporating water.



2,101,268
ENVELOPE MACHINE
Abraham Novick, Flushing, N. Y., assignor to F. L. Smithe Machine Co., Inc., New York, N. Y., a corporation of New York
Application April 27, 1932, Serial No. 607,738
Renewed July 11, 1936
4 Claims. (Cl. 271—46)

1. In an envelope machine, in combination, a table, a feeder for accelerating a blank on the table from a state of rest, said blank having re-entrant corners in its trailing edge comprising a pair of endless chains and pins carried by the chains and engageable with the trailing edge of the blank to initiate its forward movement, said pins engaging said blank at points other than said re-entrant corners, and a timing and aligning feeder operated at a higher speed than the first mentioned feeder, and comprising a pair of endless chains and pins on the chains for overtaking the blank, engaging the trailing edge thereof gently in said re-entrant corners, and taking over control of the blank from the first feeder, the chains of each feeder being relatively adjustable laterally of the machine.

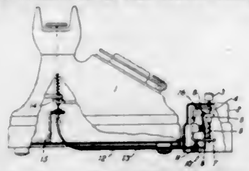


2,101,269
REMOTE CONTROL SYSTEM
Riccard Pudelko, Zug, Switzerland, assignor to Landis & Gyr, A-G., a corporation of Switzerland
Application September 11, 1934, Serial No. 743,623
In Switzerland September 15, 1933
5 Claims. (Cl. 175—375)

1. A remote control impulse receiving device including in combination a relay, an armature therefore, a motor supplied with power under control of the relay, a spring for returning the motor to its normal, initial position, a main switch, a cam for controlling the main switch, a pawl and ratchet drive operated by the motor for moving the cam whereby the cam is moved only after the motor has operated for a predetermined period, and means engageable with said armature and controlled by operation of the

motor, for preventing operation of the motor except from a position of rest.

2,101,270
BLOWPIPE
Owen R. Rice, Chicago, Ill., assignor to Freyn Engineering Company, Chicago, Ill., a corporation of Maine
Application March 14, 1935, Serial No. 11,005
17 Claims. (Cl. 138—63)

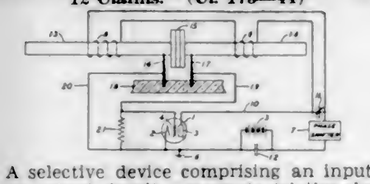


1. In a blow pipe for blast furnaces, in combination, a pipe casing and a ring assembly within said casing, said ring assembly comprising a plurality of rings disposed end for end coaxially relative to said casing, each of said rings having an inwardly flaring end portion of less diameter than the remainder of said ring, most of said rings at their other ends having an annular shoulder for receiving and encircling the first mentioned end of an adjacent ring whereby said assembly may be cleaned out without fouling the joints between adjacent rings, and insulating material between said ring assembly and said casing, said rings being of a material capable of resisting the high temperatures of a blast for blast furnaces.

2,101,271
SUBSTATION TELEPHONE APPARATUS
Louis Jean Joseph Schreiber, Antwerp, Belgium, assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application March 20, 1937, Serial No. 131,979
In Belgium June 17, 1936
5 Claims. (Cl. 179—158)

1. A hand telephone support comprising a base portion, a cradle portion to receive a hand tele-

phone, a circuit-controlling plunger member to be depressed by the hand telephone when placed on the cradle portion and to be movable upwardly upon removal of the hand telephone, and



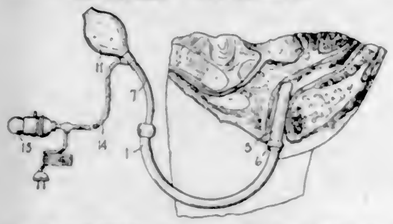
means for locking the plunger member in its upward position, said means comprising a flexible cable attached at one end to said plunger member, and spring-controlled means at the other end of said cable.

2,101,272

COMBINED MAGNETOSTRICTION AND PIEZOELECTRIC SELECTIVE DEVICE

Herbert J. Scott, Passaic, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application July 18, 1934, Serial No. 735,861
12 Claims. (Cl. 178—44)



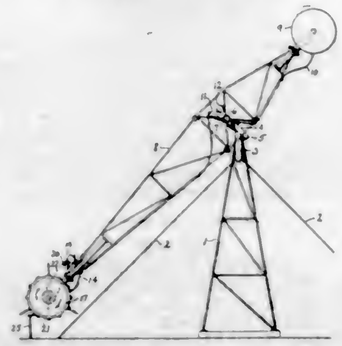
1. A selective device comprising an input circuit, an output circuit, a magnetostrictive element tuned to the frequency of oscillations which it is desired to transmit from said input circuit to said output circuit connected to said input circuit, a piezoelectric element having all its natural periods of vibration remote from that of the magnetostrictive element, a mounting for said piezoelectric element, means symmetrically connecting said magnetostrictive element to said piezoelectric element to permit transfer of mechanical energy from the magnetostrictive element to the piezoelectric element without imposing substantial stress on said piezoelectric element relative to its supports, and means connected to the piezoelectric element and to the output circuit to impress corresponding electrical oscillations of the desired frequency derived from the piezoelectric element upon the output circuit.

2,101,273

MASSAGE INSTRUMENT FOR TREATING THE PROSTATE GLAND

Wallace D. Smith, Kalamazoo, Mich.

Application January 9, 1935, Serial No. 935
10 Claims. (Cl. 128—64)



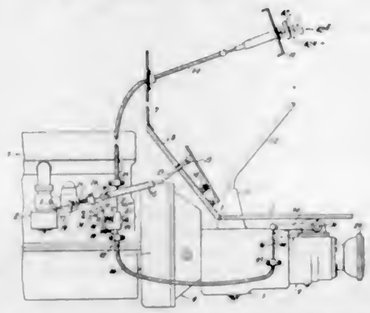
7. In a massage instrument for treating the prostate gland, a tubular applicator with its tip end apertured by an opening cut at an angle oblique to the axis of the tube, an expansible rubber sack within the applicator to expand and protrude through the said aperture and generally toward one side, and an outer rubber casing for said parts and having suitable retainer means.

2,101,274

AMUSEMENT RIDE DEVICE

Victor Stanzel, Schulenburg, Tex.

Application November 1, 1935, Serial No. 47,744
6 Claims. (Cl. 272—36)



2. An amusement device comprising a stand, a ship supporting beam mounted to revolve on the stand in a plane at an angle to the vertical whereby the elevation of the ship is varied, a passenger ship mounted on the beam to rotate about an approximately horizontal axis, and means for balancing the beam.

2,101,275

AUTOMOTIVE DRIVING MECHANISM

William C. Starkey, Indianapolis, Ind., assignor, by mesne assignments, to William C. Starkey, Raymond S. Pruitt, and Walter H. Beal, trustees

Application May 15, 1933, Serial No. 671,058
21 Claims. (Cl. 192—.01)

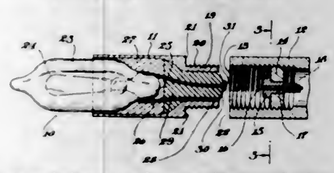
1. In an automotive driving mechanism, a driving member, a driven member and a one way overrunning clutch therebetween, means for locking out said clutch for positively connecting said driving and driven members, and means for actuating said lock out means and including mechanism operating in the initial part of its movement to speed up one of said members and operating in the final part of its movement to complete the lock out operation.

2,101,276

TOY AIRPLANE

William J. Walter, Mishawaka, Ind.

Application November 20, 1936, Serial No. 111,757
7 Claims. (Cl. 46—77)



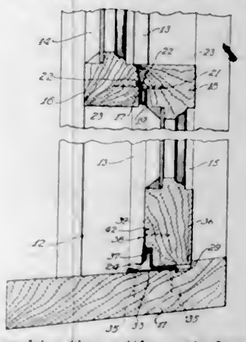
1. A toy airplane comprising, a body portion, a plate extending into said body, a pulley rotatably supported by said plate, and a U-shaped projectile receiving clip supported by said plate extending beneath said body.

2,101,277

MINIATURE ELECTRIC LAMP

Frederick Charles Wappler, New York, N. Y.

Application December 21, 1934, Serial No. 758,561
6 Claims. (Cl. 176—32)



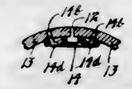
1. In a miniature electric lamp of the character described, a tubular metallic sleeve, a bulb with spaced lead wires projecting from its rear end, said bulb being snugly mounted in the forward end of said sleeve with its rear end within the sleeve and its forward end projecting therefrom, said wires extending rearwardly through said sleeve, an unyielding bonding material around the rear end of the bulb to secure the latter in rigid association with the sleeve, and a mass of resilient, nonconductive, sealing material filling the rear end of the sleeve and yieldably embedding said wires in spaced relation therein.

2,101,278

WEATHER STRIP

George F. Wolff and Willard Congreve, Chicago, Ill.

Application May 13, 1936, Serial No. 79,517
2 Claims. (Cl. 20—69)



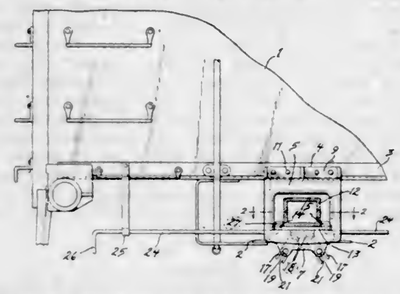
1. The combination with a window frame having a sill and a sash movable relative thereto, of a rigid rib strip secured to said sill and having a plurality of weep holes therein, and a liner strip secured to said sash and provided with a flange portion adapted to substantially close certain of said weep holes when said sash is moved to closed position to permit water to drain between said sill and said sash while effectively preventing air leakage therebetween and a second flange portion adapted to resiliently engage one surface of said rigid rib strip to provide an effective seal therebetween.

2,101,279

PISTON EXPANDER

Glen J. Worel, Minneapolis, Minn., assignor to Charles M. O'Neil, Hopkins, Minn.

Application June 3, 1935, Serial No. 24,594
6 Claims. (Cl. 309—12)



1. In combination with a piston having a skirt provided with a slot to permit expansion, an expander comprising a curved spring member, the body of which lies substantially in a plane, extending vertically against the inner peripheral wall of said piston skirt and traversing said slot, said spring member having a pair of attachment lugs at its ends for engagement with said piston skirt at opposite sides of the slot and said spring member having bearing portions adjacent said attachment lugs for engaging the inner piston wall, the outer surface of said bearing portions being disposed outwardly of the inner and connected ends of said attachment lugs.

2,101,280

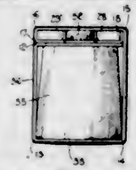
RAILWAY CAR COUPLER POSITIONING DEVICE

William Wright, Chicago, Ill., assignor of one-half to Jay V. Westcott and one-half to Claude M. Baker, both of Chicago, Ill.

Application August 10, 1936, Serial No. 95,125
8 Claims. (Cl. 213—16)

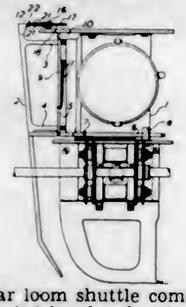
1. In a device of the character described, the combination of a car part, a coupler part movable laterally and vertically thereof, a pair of supporting centering links each of which is pivotally engaged at spaced points thereon with said car and coupler parts, said centering links having the planes of the pivotal axes thereof oppositely inclined laterally with reference to a vertical plane and having their pivotal engagements with said car part disposed downwardly from their pivotal engagements with said coupler part, and at least one of the pivotal engagements of each link being slidable correspondingly with the line of the pivotal engagements thereof whereby said links act independently to carry said coupler

part on respective sides of a central position of said coupler part in its lateral movement.



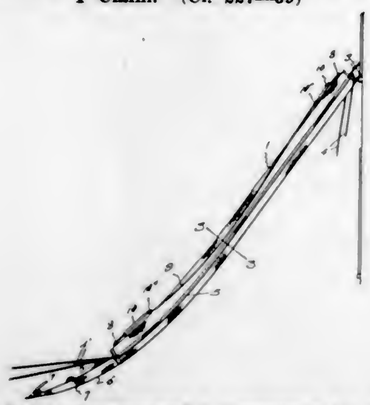
7. In a device of the character described, the combination of a coupler throat part including side walls, a coupler part associated with the opening of said throat part and movable laterally and vertically with reference thereto, a centering device operative to elevate said coupler part with lateral movement thereof out of a central position and vice versa, a longitudinally movable positioning rod extending laterally from said coupler part and operable into an opening in one of said side walls and having a downward bearing engagement with said side wall, and said rod having its inner end portion extending vertically upward and engaged in a vertical aperture in said coupler part.

2,101,281
DINNER PAIL
Kirk E. Porter, Wooster, Ohio, assignor to The Buckeye Aluminum Company, Wooster, Ohio, a corporation of Ohio
Application September 24, 1936, Serial No. 102,339
4 Claims. (Cl. 220—23)



1. A dinner pail including a liquid pail having an outturned bead at its upper end, a food container adapted to fit within the upper open end of the pail and having an outturned rim bead with flattened portions, a hood cover for the food container having an outturned lower end provided with an inturned bead frictionally fitting the outturned bead on the liquid pail, and locking lugs in said cover adapted to pass the flattened portions of the bead, the cover being adapted to be turned upon the container to locate the lugs in locking position beneath the bead and a handle upon the cover whereby the food container and cover may be removed as a unit from the pail.

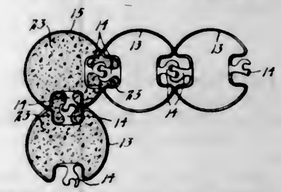
2,101,282
CARTON
William G. Piper, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
Application August 22, 1933, Serial No. 686,223
4 Claims. (Cl. 206—46)



3. A package comprising an article contained within a strip of material bent on three lines to form a rectangle in cross-section, the fourth side of which continues beyond the first side, the continued material of the fourth side is bent at a distance beyond the first side to be over and parallel but spaced from the first side then in a direction parallel to the second side, then to lie parallel to and directly on the first side, and then in a direction parallel and adjacent to the continued fourth side, the material ending at the first bend of the continued fourth side, an H-cut between the last two bends, an O-cut on the first side registering with the H-cut and the material of the two halves of the H-cut bent upward to form braces for the topmost side.

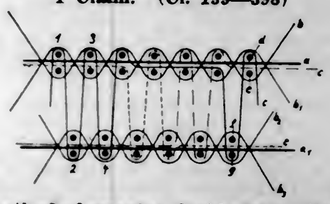
2,101,283
CIRCULAR LOOM
William Pool, Spondon, near Derby, England, assignor to Celanese Corporation of America, a corporation of Delaware
Application March 17, 1937, Serial No. 131,343
In Great Britain April 7, 1936
9 Claims. (Cl. 139—13)

1. A circular loom shuttle comprising a detector finger carried by the shuttle, means to urge said finger into contact with one sheet of a warp shed in which the shuttle lies, so as to detect warp threads missing from that sheet, a stop mechanism actuating member and a member adapted to be moved by said finger upon such detection into contact with the other sheet of the warp shed and by such contact to be moved towards the rear of the shuttle to operate said stop mechanism actuating member.



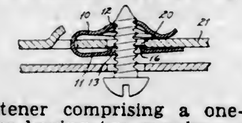
2,101,284
LIFESAVING CHUTE
Lewis Simpson, Monterey Park, Calif.
Application October 19, 1935, Serial No. 45,824
1 Claim. (Cl. 227—39)

A life saving apparatus comprising an elongated flexible chute having anchoring means



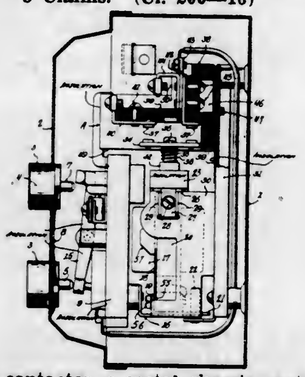
at the ends thereof, an elongated endless cable disposed longitudinally of the chute and having one flight externally disposed of the chute and the other flight internally disposed in the chute, pulleys mounted on the end portions of the chute for supporting the said endless cable, a brake structure at one end of the chute with which the cable is engaged, said brake consisting of a semi-cylindrical shaped structure secured to the chute and provided with upstanding guide walls, and a semi-cylindrical shaped movable member for disposition over the first-mentioned semi-cylindrical structure and between the said guide walls, said semi-cylindrical structures each being lined with a heat resisting material between which the outer flight of the endless cable is disposed.

2,101,285
TUBULAR INTERLOCKING PILING
Edwin Fenton Stevens, St. Paul, Minn.
Application January 31, 1936, Serial No. 61,712
2 Claims. (Cl. 61—53)



1. A tubular pile unit comprising an elongated tubular member, a portion of one side of said tubular member being displaced inwardly to form a groove extending longitudinally of said member, an interlocking element attached to said tubular member and projecting therefrom and disposed at least in part in said groove and a second interlocking element attached to said tubular member and projecting therefrom and extending longitudinally of said member in circumferentially spaced parallel relation to said groove, said interlocking elements being situated at such respective radii from the longitudinal axis of said member that, when two such members are connected by interlocking one interlocking element of one member with the other interlocking element of the second member, the facing sides of the respective members will be substantially in abutment with each other and said interlocking elements will be concealed.

2,101,286
METHOD OF PRODUCING DOUBLE WARP PILE FABRICS WITH FIGURED BACKS
Heinrich Theunissen, Kaldenkirchen, Germany
Application May 28, 1935, Serial No. 23,896
In Germany June 7, 1934
1 Claim. (Cl. 139—398)

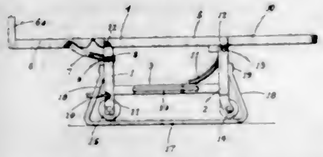


A method of weaving double warp pile fabrics on a double shuttle loom for double pile fabrics the steps which comprise forming a double shed of the warps of the upper fabric with the pile warps and one series of binder warps in the upper plane, the stuffer warps in the central plane, and the second series of binder warps in the lower plane, inserting simultaneously two wefts one into each shed of the upper fabric, then forming a double shed of the warps of the lower fabric with pile warps and one series of binder warps in the lower plane, the stuffer warps in the central plane, and a second series of binder warps in the upper plane, inserting simultaneously two wefts into each shed of the lower fabric, and repeating the process.

2,101,287
FASTENING DEVICE
George A. Tinnerman, Rocky River, Ohio, assignor to Albert H. Tinnerman, Cleveland, Ohio
Application July 15, 1937, Serial No. 153,756
7 Claims. (Cl. 109—36)

2. A fastener comprising a one-piece sheet metal device having two members, each having registering bolt receiving apertures therein, means adjacent one of the apertures for engaging the thread of a bolt and means adjacent the other aperture for clearing the bolt, but for entering an aperture in a part to be joined and for maintaining the apertures in the part and fastener in registration.

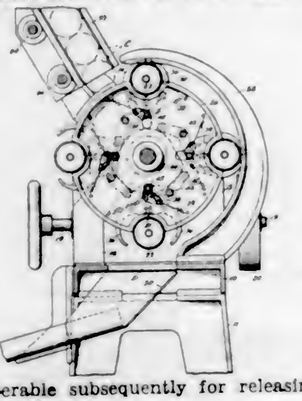
2,101,288
CONTACTOR CONSTRUCTION
Hermon L. Van Valkenburg, Wauwatosa, Wis., assignor to Square D Company, Detroit, Mich.
Application January 26, 1935, Serial No. 3,571
5 Claims. (Cl. 200—16)



1. In a contactor, a metal chassis, metal side walls extending outwardly therefrom and having guiding slots, an insulating elongated crosshead mounted transversely of said walls and having extensions projecting from one of the longer sides of said crosshead and forming slides located within said guiding slots, said extensions projecting at right angles to said crosshead, movable contact members carried by said crosshead, a stationary contactor block formed of insulating material and having a base portion supported from said chassis and having an outwardly projecting wall, and a plurality of stationary contacts carried by said outwardly projecting wall and positioned for engagement by said movable contacts.

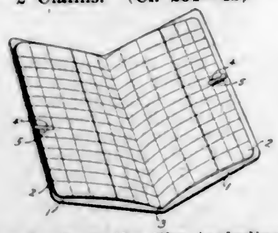
2,101,289
ILLUMINATING DEVICE
Charles H. Victoreen, Cleveland, Ohio
Application November 8, 1934, Serial No. 751,997
7 Claims. (Cl. 240—73)

1. An indirect illuminating device of sheet metal, having a hook member adapted to engage the wall molding of a room to be illuminated, a brace member adapted to bear below said molding against the wall upon which said molding is mounted, and an intermediate trough member adapted to receive and support lamp means and to direct light therefrom upwardly and outwardly into said room, said device being of substantially uniform section lengthwise of said molding but its trough member having an upset part arranged to support a lamp.



2,101,290
INVALID CHAIR
Alberta M. Pierson, Stockton, Calif.
Application December 18, 1936, Serial No. 116,539
4 Claims. (Cl. 155—28)

1. In an invalid chair including supporting legs, a seat mounted on the legs, and wheels mounted on the lower ends of the legs; arm rests normally disposed to the sides of and above the seat, means mounting the arm rests for selective movement from said normal position to a floor engaging position below the plane of the bottom of the wheels, and retaining means to maintain the arm rests in either position selectively.

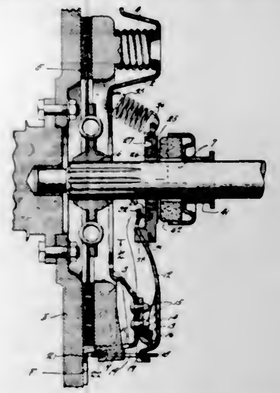


2,101,291
MACHINE FOR PRELIMINARILY ASSEMBLING COVERS TO CONTAINERS
John F. Price, Fulton, N. Y., assignor to Oswego Falls Corporation, Fulton, N. Y., a corporation of New York
Application June 23, 1936, Serial No. 86,807
9 Claims. (Cl. 93—55.1)

1. A machine for applying covers to containers comprising a suitable frame, a shaft journalled in said frame, means for effecting continuous rotation of said shaft, a pair of spaced apart container supporting disks secured to and rotatable with said shaft, a cover carrying disk secured to and rotatable with said shaft, said container supporting disks and cover supporting disk being provided with means for arranging the containers and covers in axial alinement, means operable during rotation of said disks to effect relative axial movement between the container and the cover to place the latter on the container, and

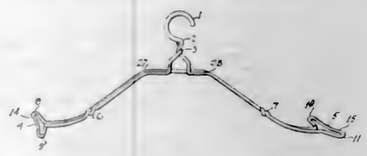
means operable subsequently for releasing the covered containers.

2,101,292
PASSBOOK OR THE LIKE
Tom B. Radabaugh, West Milton, Ohio
Application August 19, 1936, Serial No. 96,849
2 Claims. (Cl. 281—42)



1. A pass book or the like including a cover portion foldable upon a medial line to provide sheet supporting sides, and a plurality of superposed leaves attached to the cover portion at the medial fold line for to and fro swinging motion to expose either side of the sheets, and foldable with the cover, characterized by a detent member on the sheet supporting sides of the cover, and spaced from the medial fold line thereof in proximity with the marginal edge of the cover, comprising a member bent upon itself to provide substantially parallel legs for clasping the free margins of separate groups of leaves and located wholly within the cover portion, the detent members on opposite sides of the medial fold line of the cover being off-set out of alignment with each other and one leg of each detent member being secured to the cover, and each detent member being reversely folded into an arcuate bight with its free leg directed toward the leg attached to the cover for gripping engagement with the sheets, the margins of which are insertible under and removable from beneath the overhanging legs of the detent members.

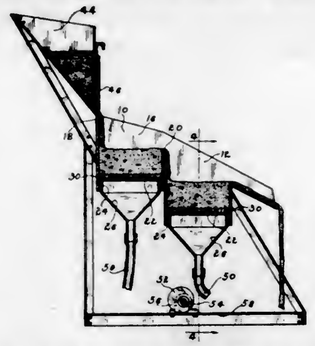
2,101,293
FRICTION CLUTCH
Harold V. Reed, Chicago, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application January 22, 1936, Serial No. 60,156
6 Claims. (Cl. 192—68)



1. In a friction clutch, a spring-urged pressure plate, a pressure plate release lever mounted for

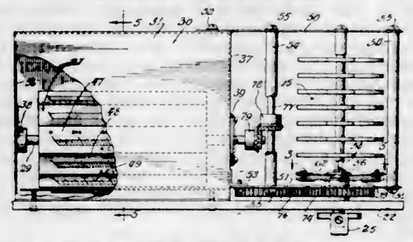
pivotal movement, means connecting one end of said lever with said pressure plate, a lever operating ring mounted for movement along the axis of rotation of said pressure plate, a strut interposed between the opposite end of said lever and said operating ring, said strut having a reduced

portion of angular cross-section received in an opening of similar cross-section in said lever thereby to restrain said strut from lateral movement relative to said lever, and means restraining said ring against rotational movement relative to said lever.



2,101,294
GARMENT HANGER
Raymond O. Ross, Portland, Oreg.
Application August 29, 1934, Serial No. 741,918
2 Claims. (Cl. 223—95)

1. A trousers hanger consisting of a downturned resilient bow having an intermediate supporting hook, each end of said bow branching laterally to form horizontal loop engaging horns, said horns extending in opposite directions and normal to said bow.

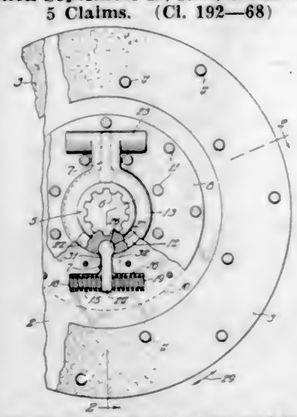


2,101,295
APPARATUS FOR AIR FLOATATION SEPARATION
Edwin M. Rusk, Seattle, Wash.
Application September 8, 1933, Serial No. 688,660
1 Claim. (Cl. 209—466)

In a stepped, multi-chamber, pneumatic, dry ore separator having an elevated feed hopper, and including a separating chamber open at top and bottom and having a discharge wall with its upper edge terminating below the upper edges of the remaining walls of the chamber, the combination of a hollow, removable open-top, air-distributer head inserted in the lower end of the chamber, a separable cover pervious to air mounted on the open-top hollow head and forming the bottom of said chamber, a separable retaining grid forming a weight and resting on said cover,

one wall of said chamber having a slot above said grid for the insertion of a slide plate which is adapted to form an auxiliary chamber-bottom.

2,101,296
ELECTRICAL MEASURING INSTRUMENT
Ray Simpson, River Forest, and George H. Koch, Chicago, Ill., assignors to Simpson Electric Company, Chicago, Ill., a corporation of Illinois
Application April 16, 1936, Serial No. 74,662
2 Claims. (Cl. 171—95)



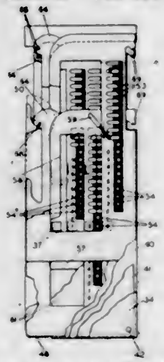
1. In an electrical measuring instrument, the combination of a housing with an electrical measuring instrument movement having a pointer, said pointer being arranged opposite a window in said housing, and said housing having a substantially drum-shaped member provided with a plurality of plane surfaces extending parallel to its axis, said drum-shaped member being mounted for rotary movement on its axis in said housing, and said plane surfaces each being provided with a scale to cooperate with said pointer, and electrical switching means carried by said housing and provided with a manual member for actuating the switch and gearing connecting said switching means and the shaft of said drum-shaped member, suitable circuits connecting said movement and said switch means and electrical resistances, whereby the circuits may be changed to change the range and characteristics of said electrical instrument, said manual means being adapted to bring into proper position with the pointer a suitable scale for each position of the switch, said housing having a plate carried thereby formed with a plurality of depressions surrounding the shaft for the switching means, and resilient oppositely extending arms carried by said shaft of said switching means and having snap rollers for engaging in said depressions, whereby the switching means and the scale are held in predetermined positions by said rollers.

2,101,297

FRICTION CLUTCH PLATE

Benjamin A. Swennes, Rockford, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application September 12, 1936, Serial No. 100,509
5 Claims. (Cl. 192—68)



1. A friction clutch plate comprising, a hub member, a disk member mounted for oscillation upon said hub member, friction facings on said disk member adapted frictionally to be engaged and driven by a clutch driving assembly, and means providing a resilient drive connection between said disk and hub members, said means including a simple lever pivotally mounted on said hub member and extending beyond the periphery of the hub member, a pair of compression springs each bearing at one end upon a portion of said disk member and having their opposite ends acting upon the outer end of said lever whereby yieldingly to resist pivotal movement of the lever in either direction, and means forming a part of said disk member adapted to engage said lever between its fulcrum and the point of engagement between said springs and said lever.

2,101,298

CALCULATOR

Wesley Taylor, New York, N. Y., assignor of thirty-eight one-hundredths to Donald S. Root, Bronxville, N. Y., nineteen one-hundredths to Guy Atkinson, New York, N. Y., and five one-hundredths to Warren C. Du Bois, New York, N. Y.

Application April 25, 1933, Serial No. 667,779
15 Claims. (Cl. 235—69)

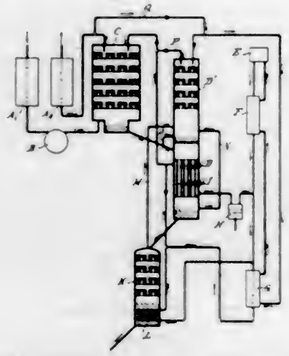
8. In a calculating machine, a rectangular plate having an opening therein, and a second rectangular plate lying in a plane substantially parallel to that of said first-named plate, said second plate having an opening therein registrable with the opening in said first-named plate, said plates each having thereon at the openings registering surfaces substantially perpendicular to their major surfaces for simultaneous engagement by a plate-moving instrument.

2,101,299

CEMENT

Waldo E. Tyler, Kansas City, Mo., Thomas B. Douglas, Houston, Tex., Paul R. Chamberlain and Russ A. Loveland, Dewey, Okla., assignors to Dewey Portland Cement Company, Kansas City, Mo., a corporation of West Virginia

No Drawing. Original application January 10, 1935, Serial No. 1,154. Divided and this application September 3, 1937, Serial No. 162,296
15 Claims. (Cl. 106—25)



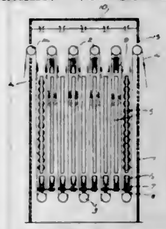
1. A composition of cementitious materials, comprising a mixture of burned argillaceous and calcareous substances, an inert unburned calcareous substance, gypsum, anhydrite and over 0.3% of a plasticizer by weight of said mixture, said plasticizer comprising a mixture of rosin and a fat.

2,101,300

PROCESS FOR THE MANUFACTURE OF KRYPTON AND XENON BY SEPARATION FROM ATMOSPHERIC AIR

André Weil, Paris, France, assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York

Application March 5, 1937, Serial No. 129,139
In France March 12, 1936
5 Claims. (Cl. 62—175.5)



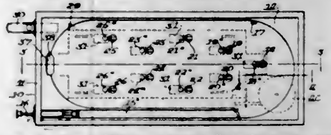
1. A process for extracting krypton and xenon from atmospheric air by rectifying gaseous air with a liquid mixture of oxygen and nitrogen and vaporizing the liquid resulting from the rectification, wherein the gas resulting from the vaporization of the liquid mixture of oxygen and nitrogen resulting from the rectification is rectified with liquid oxygen, liquid nitrogen or a mixture thereof separately from the air so as to free it from its krypton, compressed, liquefied by heat exchange with the liquid mixture of oxygen and nitrogen to be vaporized, and the liquid thus formed is utilized as washing liquid for the air to be treated.

2,101,301

METHOD AND APPARATUS FOR DRYING CELLULOSE AND LIKE MATERIAL IN A CONTINUOUS WEB

Sven Wellmar, Stockholm, Sweden

Application August 9, 1933, Serial No. 684,294
In Sweden September 16, 1932
5 Claims. (Cl. 34—48)



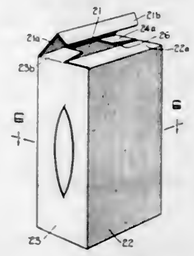
1. The herein described method of drying a continuous web of cellulose, cloth and the like in a chamber, which method consists in conveying the web through the chamber substantially continuously in a zig-zag path and in generally vertical coils with the web hanging between the points of reversal, forcing warm air into the spaces between the vertical runs of the web by means of inlet ducts extending into the space between each of two consecutive vertical runs of the web, respectively, adjacent one of the points of reversal and projecting substantially across the width of the web, distributing the air from said duct and blowing it against the web at points disposed substantially over the full width thereof, discharging the air adjacent the other point of reversal at points disposed over substantially the full width of the web, and supplying radiant heat to said compartment, whereby both sides of the web are subjected simultaneously to radiant heat and to the warm air.

2,101,302

AMUSEMENT GAME

Bradlee W. Williams and Homer S. Williams, Chicago, Ill., assignors to Bally Manufacturing Co., Chicago, Ill., a corporation of Illinois

Application December 20, 1935, Serial No. 55,325
11 Claims. (Cl. 273—121)



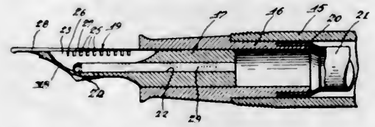
9. In a ball rolling game having a substantially horizontal table provided with pockets for receiving the balls, each pocket including a normally open ball closed switch, indicator lamps carried on the table respectively in proximity to each pocket to designate same, circuits for the said switches and lamps, and an auxiliary circuit including an electromagnetic motor device, the combination with said structure of a circuit control member carried by the table and having means for establishing circuits for the lamps to light the lamps, said circuits being individually established from one lamp to another as the balls are deposited in the respective pockets and in a predetermined order governed by the position of the control member, said control member including means for establishing the auxiliary circuit and causing operation of the motor device when a predetermined number of balls have been deposited in the lamp designated pockets.

2,101,303

LOCKING MEANS FOR JOINING SHEET MATERIAL

Marshall I. Williamson, Edgewater, N. J.

Application October 1, 1935, Serial No. 43,029
4 Claims. (Cl. 229—27)

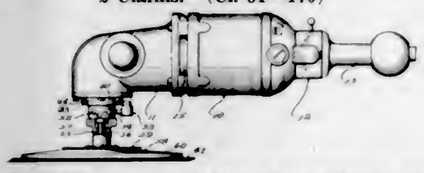


1. A structure embodying a prepared blank of foldable sheet material, said blank comprising a series of panels related in integral sequence, locking means for joining certain of the said panels in effecting assembly of the structure, said locking means comprising at least one set of two individual locking members provided for mutual coordination, each locking member being formed integral with, and surrounded by, the sheet material of the blank, and each locking member, further, comprising both a male and a female formation, the male formation of one of a set of members being adapted for locking coordination with the female formation of the other of the set of members, so that the bases of the respective male members provide mutually limiting stops, the respective male members being of substantially equal extensions, and said individual locking members of the set being disposed in such relation to their respective panels that an edge of one of such panels lies parallel to and in abutting relation with the line of fold defining an edge of the other of such panels at which the latter is integrally related to the component structure.

2,101,304

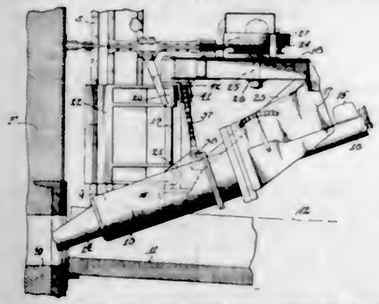
FOUNTAIN PEN

Howard S. Wright, Fort Madison, Iowa, assignor to W. A. Sheaffer Pen Company, Fort Madison, Iowa, a corporation of Delaware



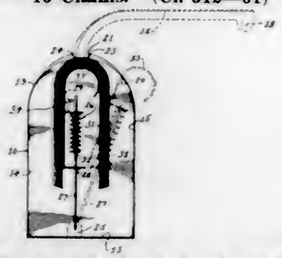
Application June 5, 1936, Serial No. 83,599
19 Claims. (Cl. 120—50)

1. A fountain pen including a feed bar having a shank portion adapted to be mounted within the end of the barrel thereof and an extending nib supporting portion, an internal longitudinally extending feed duct communicating at one end with the writing fluid reservoir of the barrel, a fissure of capillary dimensions communicating with the other end of said feed duct and extending over a portion of the nib supporting portion in a direction toward the barrel, and a plurality of spaced transversely extending combs of capillary dimensions disposed on a portion of the feed bar extending inwardly of the point of communica-



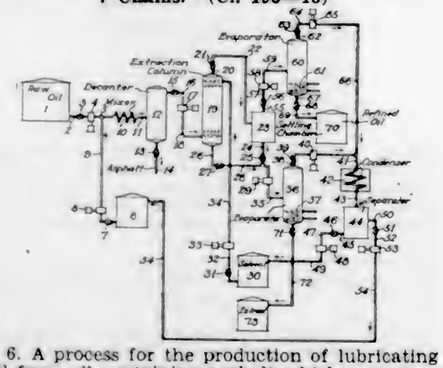
tion between said fissure and said feed duct and communicating with said fissure for accommodating writing fluid expansion from the reservoir.

2,101,305
SANDING MACHINE
Frans O. Albertson, Sioux City, Iowa, assignor to Albertson & Company, Inc., Sioux City, Iowa, a corporation of Iowa
Application August 13, 1937, Serial No. 158,857
2 Claims. (Cl. 51—170)



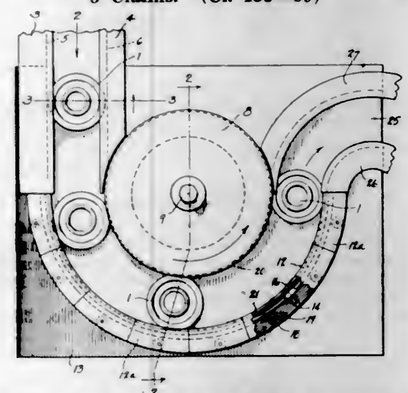
1. In an electric sanding and polishing machine, the combination of an electric motor having a drive shaft and housing, with a gear housing carried by said motor housing, speed reduction gearing located in said gear housing, a drive spindle rotatably mounted in said gear housing and projecting therefrom, said drive spindle being operatively connected to said motor through said speed reduction gearing, and said drive spindle having a threaded portion, a sanding wheel having a hub provided with a complementary threaded portion, said sanding wheel being adapted to support operating tools, a thrust collar carried by said drive spindle, said thrust collar being provided with a radially extending socket, and a pivoted lever carried by said gear housing, said pivoted lever being mounted in a pivot extending substantially parallel to said drive spindle, and having a transversely extending cylindrical lug adapted to be received in said socket whereby the spindle may be secured and held in fixed position by means of said pivoted lever, while the sanding wheel is threaded on or off the threaded portion of said drive spindle.

2,101,306
MUD GUN
Charles W. Andrews and Charles E. Dougan, Chicago, Ill., assignors, by mesne assignments, to August F. Giese, Jr., Gary, Ind.
Application September 8, 1936, Serial No. 99,726
10 Claims. (Cl. 266—42)



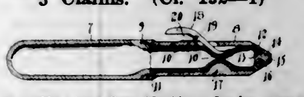
1. In apparatus for closing furnace tapping holes including a mud gun and a supporting structure therefor, the combination comprising a stationary member and means responsive to recoil movement of said gun for locking said structure to said member.

2,101,307
PAPER DISPENSER
Edward Theodore Bodette, Wisconsin Rapids, Wis., assignor to Nekoosa-Edwards Paper Company, Port Edwards, Wis., a corporation of Wisconsin
Application April 10, 1936, Serial No. 73,685
13 Claims. (Cl. 312—61)



6. A dispenser for a stack of non-interleaved flat sheets of paper comprising a casing having an elongated dispensing opening in its upper end defined by the cut away margins of convergingly rounded walls, a follower plate having a correspondingly rounded surface for receiving a stack of sheets in suspended position looped thereover, said casing having a wall thereof hinged to be opened up to provide an opening into which the follower plate is swung in position for loading with a stack of sheets, pivotally mounted supporting posts for said follower plate tiltable to move said plate into loading position, and springs surrounding and cooperatively supported by said posts to urge said follower plate and supported stack of sheets toward said dispensing opening and center the same with respect to the opening.

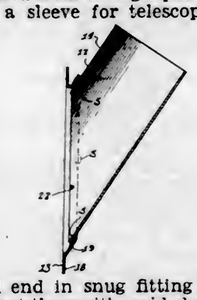
2,101,308
PROCESS FOR PRODUCING LUBRICATING OILS
Ulric B. Bray, Palos Verdes Estates, and Claude E. Swift, Glendale, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Original application February 23, 1932, Serial No. 594,605. Divided and this application March 4, 1935, Serial No. 9,314
7 Claims. (Cl. 196—13)



6. A process for the production of lubricating oil from oil containing asphalt which comprises treating said oil with petroleum naphtha to precipitate a portion of the asphalt from the oil, removing the precipitated asphalt from the oil and remaining asphalt dissolved in petroleum naphtha, extracting the oil and remaining asphalt dissolved in petroleum naphtha with a selective solvent for the asphalt and the fractions present in said oil which have a high temperature viscosity susceptibility and thereby separating said oil into two fractions, one of which contains oil exhibiting a relatively low temperature viscosity susceptibility and another of which contains oil exhibiting a relatively high temperature viscosity susceptibility and the remaining asphalt and separating said fractions.

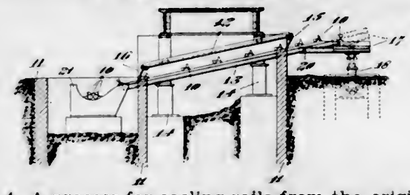
2,101,309
CAN END CURLING RING
Wilford E. Burns, Burlingame, Calif., assignor to M. J. B. Co.
Application January 22, 1935, Serial No. 2,846
5 Claims. (Cl. 153—59)

1. In a can end curler of the character described, the combination with a revolubly driven curling wheel, of a curling die spaced from the wheel to receive the can ends between them for curling; said die comprising a plurality of arcuate segments in end to end relationship and a spline applied to said die lengthwise of the segments and operable to hold them in alinement.



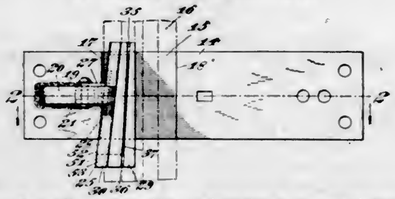
2,101,310
APPLICATOR FOR TINTING HAIR
Thomas F. Callaghan, Toronto, Ontario, Canada
Application June 12, 1937, Serial No. 147,845
5 Claims. (Cl. 132—1)

1. An applicator for tinting hair, composed of a rigid member in the form of a thick pencil, said member consisting of two parts having a screw connection, one of the parts being chambered to constitute a reservoir and the other part having a central opening, and a sponge rubber tip of a frustum shape converging to a rectangular point, said tip having a rear shank portion mounted in said hole to which tinting fluid is supplied by the reservoir.



2,101,311
FLANGED TUBULAR ARTICLE AND METHOD OF MAKING SAME
Charles R. Duncan, Waukegan, Ill., assignor to Oakes Products Corporation, North Chicago, Ill., a corporation of Michigan
Application May 3, 1935, Serial No. 19,550
1 Claim. (Cl. 138—47)

A filling spout for a gasoline tank, said spout comprising a smooth walled cylinder formed from a single piece of sheet metal having welded interlocking edges and having a beveled end, and a flange formed from a single piece of sheet metal and having a sleeve for telescopically receiving

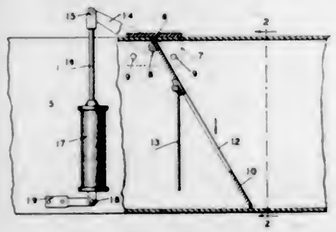


said beveled end in snug fitting full cylindrical surface contact therewith, said sleeve and beveled end being welded together throughout said surface contact area.

2,101,312
PROCESS FOR COOLING RAILS
Reginald B. Gerhardt, Steelton, Pa., assignor to Beth-Mary Steel Corporation, a corporation of Maryland
Application December 5, 1931, Serial No. 579,316
6 Claims. (Cl. 148—21)

4. A process for cooling rails from the original mill heat comprising the steps of cooling the rails from a temperature above the critical range at a rate at least as rapid as that which normally occurs on the hot bed until the temperature of the rails is substantially below 500° C., and after such cooling but before the major mass of the head metal has cooled below 300° C. from the original mill heat enclosing the rails and cooling slowly through a temperature range which includes an extended range below 300° C. to prevent the development of those stresses and strains which tend to produce fissures in the heads of the rails.

2,101,313
RAIL BRACE
Raymond L. Gillispie, Bethlehem, Pa., assignor to Bethlehem Steel Company, a corporation of Pennsylvania
Application April 24, 1935, Serial No. 17,998
14 Claims. (Cl. 238—336)

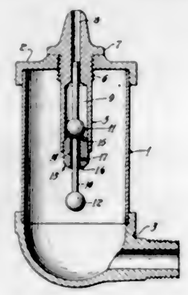


1. A rail supporting structure comprising a plate for supporting a rail, a bracing member located upon said plate, a shoulder on said plate

and a resilient wedge shaped member having a slot intermediate its ends adjustably mounted intermediate the bracing member and the rail to force the rail against said shoulder during assembly and to resiliently brace said rail in service and means closing the slot at each end of the wedge.

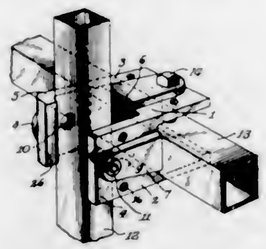
2,101,314
PRODUCTION OF UNSATURATED HYDROCARBONS
Adolf Grün, Basel, Switzerland, assignor to American Hyalsol Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Application March 14, 1935, Serial No. 11,072. In Germany March 17, 1934
3 Claims. (Cl. 260—170)

1. The process of splitting secondary amines containing at least one alkyl radical of more than 8 carbon atoms between the nitrogen atom and the carbon atom of said alkyl radical comprising heating such substituted amine together with a metal chloride capable of reacting with substituted amines forming salts to a temperature of about 200 to 280° C. at which the splitting occurs.



2,101,315
AUTOMATIC CHECK DAMPER
William Kemp, St. Louis, Mo.
Application August 27, 1934, Serial No. 741,632
1 Claim. (Cl. 277—45)

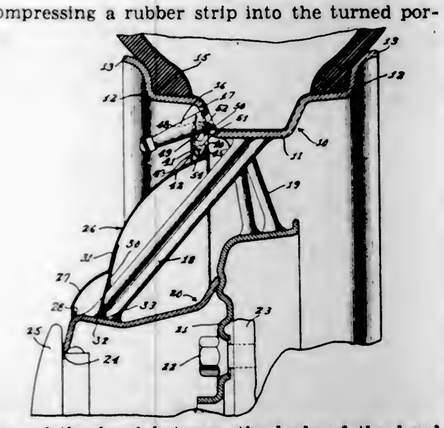
In a device of the class described, the combination with a substantially horizontal wind box, of a rock shaft located adjacent the upper wall of the box, a main damper carried by said shaft and extending in an inclined plane toward the lower wall of the box, said main damper being provided with an air opening, an auxiliary damper pivoted to the main damper adjacent the upper edge of said opening to normally depend in position to uncover said opening but to close said opening when moved into parallelism with the main damper by forced draft, and a dash pot connected with the main damper to retard the movement thereof.



2,101,316
VALVE
Albert E. Kettnich, Chicago, Ill.
Application March 2, 1936, Serial No. 66,529
2 Claims. (Cl. 137—122)

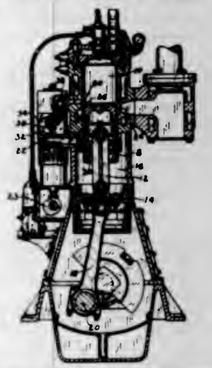
2. A radiator valve, including a hollow body portion defining a chamber, a cap closing the same, a vertical sleeve projecting through said cap and in threaded engagement therewith, said sleeve projecting into said chamber and communicating with the atmosphere, a plug closing the lower sleeve end and provided with a vertical bore, said plug having a seat on the lower and upper ends about said bore, a pair of connected valves movable to coact with said seats, and a vent in said plug between said seats providing communica-

tion between the chamber and the atmosphere when the lower valve seat is closed.



2,101,317
CLAMPING DEVICE
Felix Joseph Lemieux, Chicago, Ill., assignor of twenty-five per cent to John J. McLaughlin, twelve and one-half per cent to Emma Lemieux and twelve and one-half per cent to Mary Tonjum, all of Chicago, Ill.
Application August 12, 1935, Serial No. 35,777
16 Claims. (Cl. 189—36)

1. A clamp comprising a pair of clamping members of like construction disposed back to back and held together by means of a connecting member, each of said clamping members comprising a pair of spaced jaws connected by a wall, the jaws being at substantially right angles to said wall and forming a substantially rectangular space therewith, one of said jaws being provided with an overhanging lip, and each of said jaws being provided with a threaded bore and being adapted to receive a threaded clamping screw.



2,101,318
ORNAMENTAL BEAD AND METHOD OF APPLYING THE SAME TO ORNAMENTAL WHEEL DISKS
George Albert Lyon, Allenhurst, N. J.
Application December 22, 1934, Serial No. 758,809
8 Claims. (Cl. 41—10)

1. The method of applying an ornamental bead to a wheel disk which consists in providing the outer portion of the disk with a groove, inserting the edge of a turned portion of a bead having a body of curved cross-sectional shape into said groove, seaming the outer edge of the disk, and compressing a rubber strip into the turned por-

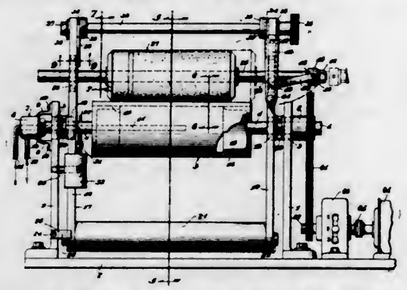
tion of the bead between the body of the bead and said seam.

2,101,319
INTERNAL COMBUSTION ENGINE
Robert C. Moffitt, Seattle, Wash.
Application March 25, 1935, Serial No. 12,988
5 Claims. (Cl. 123—71)

1. The combination in an internal combustion engine of a combustion cylinder having an air intake port and exhaust port, a co-axial scavenging cylinder having an air outlet port, an exterior casing forming an air-receiving space open to said outlet port and a cam-actuated valve controlling admission of air to said space, said casing having a compressed-air reservoir and a fluid pressure valve controlling communication between said space and reservoir, and a cam-actuated inlet valve controlling communication between the compressed air chamber and the intake port.

2,101,320
LUBRICATING DEVICE FOR SEWING MACHINE LOOP-TAKERS
Walter Myers, Bridgeport, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application December 28, 1936, Serial No. 117,712
3 Claims. (Cl. 112—256)

1. A rotary loop-taker for sewing machines, comprising a cup-shaped body provided with a thread-loop seizing beak and with an annular thread-case raceway, a thread-case having a cylindrical side wall provided with a circumferential bearing-rib journaled in said raceway, a pad-holding strap upon the outer face and lengthwise extending circumferentially of said



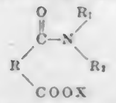
cylindrical wall of the thread-case, said strap having opposed side edges spaced from said cylindrical wall, and a lubricant-absorbent pad secured against the outer face of said cylindrical wall by said strap.

2,101,321
HYDROXY COMPOUNDS OF THE DIBENZANTHRONE SERIES
Heinrich Neresheimer, Anton Vilsmeier, and Robert Held, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application July 8, 1936, Serial No. 89,652. In Germany July 10, 1935
4 Claims. (Cl. 260—61)

1. The hydroxy compounds of the dibenzanthrone series selected from the class consisting of unsubstituted Bz2,Bz2',Bz3-trihydroxydibenzanthrone, the unsubstituted Bz2,Bz2',Bz3,Bz3'-tetrahydroxydibenzanthrone, the Bz3-hydroxydibenzanthrone-Bz2,Bz2'-quinone, the Bz3,Bz3'-dihydroxydibenzanthrone-Bz2,Bz2'-quinone, and the halogenated derivatives of these compounds.

2,101,322
METHOD AND APPARATUS FOR MEASURING PROPERTIES OF INKS AND THE LIKE
Robert F. Reed, Cincinnati, Ohio, assignor to The Lithographic Technical Foundation, Inc., New York, N. Y., a corporation of Delaware
Application December 24, 1934, Serial No. 758,998
9 Claims. (Cl. 265—11)

1. In a device of the class described, a base and a pair of standards mounted thereon, a roller rotating substantially frictionlessly within said standards, means for controlling the temperature of said roller, a cradle mounted to rotate substantially frictionlessly about the axis of said first roller, said cradle comprising, a second roller normally in resting tangential contact with said first roller, cradle side members carrying said second roller, counterweights carried by the side members of said cradle, means for axially moving said second roller, means for disrupting the contact of the rollers, and a graduated beam and adjustable weight adapted to accurately dynamically balance the cradle.



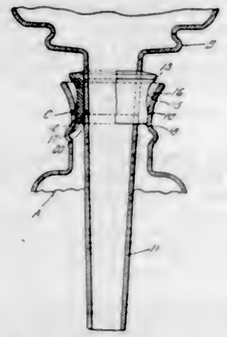
2,101,323

MONOAMIDES OF DICARBOXYLIC ACIDS AND PROCESS OF PREPARING THE SAME

Paul L. Salzberg, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 5, 1936, Serial No. 83,811
9 Claims. (Cl. 260—108)

1. Compounds having the general formula



wherein X is a member of the group consisting of hydrogen, alkali metals and alkaline earth metals, R represents the residue of a dicarboxylic acid, R_1 is an aliphatic hydrocarbon radical containing at least eight carbon atoms, and R_2 is a member of the class consisting of hydrogen and alkyl radicals.

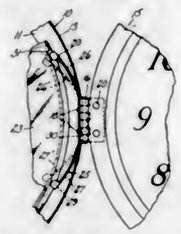
2,101,324

SEAL FOR PERCOLATORS

Alonzo A. Warner, New Britain, Conn., assignor to Landers, Frary & Clark, New Britain, Conn., a corporation of Connecticut

Application February 8, 1936, Serial No. 62,914
5 Claims. (Cl. 53—3)

4. In a coffee maker, the combination with a lower vessel having an upstanding bell-mouthed neck and an upper vessel having a depending tube extending through said neck and into said lower vessel, of a fluid sealing member comprising a resiliently deformable tubular body embracing a portion of the depending tube and having a convexly curved outer face seated in said bell-mouthed neck, a flange at the top of said member and an annular lip integrally formed with and radially protruding from the lower end thereof, said lip having a longitudinally curved annular peripheral contour the outer face of which merges into said convexly curved outer face and a conical inner face which normally tapers outwardly from that portion of the tube which it surrounds.



2,101,325

CLOCK DOOR

Othneil G. Williams, Winsted, Conn., assignor to William L. Gilbert Clock Corporation, Winsted, Conn., a corporation of Connecticut

Application October 2, 1935, Serial No. 43,241
4 Claims. (Cl. 58—53)

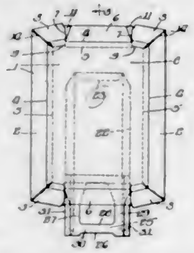
2. A clock door comprising a rim having a substantially cylindrical flange, means to demountably secure said rim in peripheral engagement with the clock face, a member secured intermediate of its ends against the inner face of said flange, said member being provided with outwardly extending resilient arms having socket portions at their ends which are arranged to peripherally engage and resiliently support a lens, a handle on the opposite side of the rim from said member, and an inwardly projecting portion on the handle protruding within the flange and arranged to receive an edge of the lens therebeneath to cooperate with the resilient arms in demountably supporting the lens.

2,101,326

STORAGE BATTERY SEPARATOR CONTAINING A COMPOUND OF MERCURY

Joseph Lester Woodbridge, Philadelphia, Pa., assignor to The Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application January 17, 1934, Serial No. 706,970
2 Claims. (Cl. 136—146)



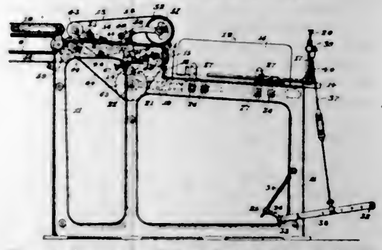
1. A separator for a lead-acid storage battery comprising a diaphragm of porous material impregnated with mercurous nitrate.

2,101,327

FOLDING FRAMED DISPLAY

Henry Ziemmerman, Chicago, Ill., assignor to Chicago Cardboard Company, Chicago, Ill., a corporation of Illinois

Application April 30, 1934, Serial No. 723,096
9 Claims. (Cl. 40—154)



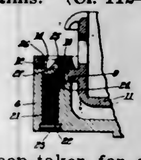
1. A framed picture display comprising a single sheet of material with its marginal edges cut, scored, and foldable to form an outwardly extending angularly offset marginal frame, the corners being intact and the marginal cuts being at a distance from the corners, and the adjacent sides of the cuts having disengageable interlocking hooked portions at their outer edges at an angle to each other for releasably drawing up the frame portions at the sides and between adjacent corners and holding the frame in forwardly extending position.

2,101,328

SHEET PILING MECHANISM

Albert Broadmeyer, Harrisburg, Pa., assignor to W. O. Hickok Manufacturing Company, Harrisburg, Pa., a corporation of Pennsylvania

Application January 11, 1934, Serial No. 706,286
5 Claims. (Cl. 271—68)



1. In mechanism of the character set forth, the combination with a layboy, of a conveyor for projecting sheets to the layboy, said conveyor including upper and lower sets of tapes between which the sheets pass, the tapes of each set being substantially parallel to each other and to the path of the sheets, and corrugating members at the discharge end of the conveyor and about which the tapes pass, said members acting to corrugate the sheets as they are discharged by the conveyor and stiffen them as they are projected from the conveyor to the layboy.

2,101,329

LUBRICATING MEANS FOR SEWING MACHINE LOOP TAKERS

George M. Eames, Bridgeport, and Robert W. Stewart, Fairfield, Conn., assignors to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey

Application November 3, 1936, Serial No. 108,938
7 Claims. (Cl. 112—256)

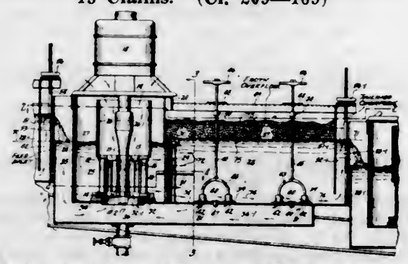
1. A rotary loop-taker for sewing machines, comprising a cup-shaped body having its side wall provided with an annular thread-case raceway and with a lubricant-supply pocket disposed radially outwardly of said raceway, said side wall being apertured to provide a duct extending outwardly from said raceway and opening into the inner side of said pocket at the leading end thereof, and a gib detachably secured upon said body and defining a segmental portion of said raceway, said gib being provided with a filling aperture communicating with the inner end of said duct.

2,101,330

FOUNDRY CORE AND DRY BINDER FOR THE PREPARATION THEREOF

William W. De Laney, Marshallton, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 26, 1936, Serial No. 102,729
4 Claims. (Cl. 22—188)



1. A foundry core including core sand and a gasoline-insoluble, pine wood resin produced by extracting resinous wood with a coal tar hydrocarbon, removing said hydrocarbon by evaporation, leaving a residue comprising wood rosin and a gasoline-insoluble resin, and extracting wood rosin from said residue by a petroleum hydrocarbon.

2,101,331

AERATING MACHINE

William Fagergren, Salt Lake City, Utah

Application January 4, 1932, Serial No. 584,673
Renewed February 3, 1937
15 Claims. (Cl. 209—169)

4. An aeration machine including in combination a structure confining a body of liquid having substantial depth and relatively great length, the dimensional extent of said structure being without abrupt volumetric variation, and means at one end of said structure effective to project aerated liquid horizontally into said body of liquid below the surface thereof throughout an area of projection substantially equal to the mean transverse sectional area of said body of liquid, the length of said body being sufficient to allow complete travel of said projected liquid there across until its velocity is effectively damped thereby, whereby a substantially horizontal flow of aerated liquid is caused through the entire volume of said body of liquid.

2,101,332

PROCESS OF PRODUCING SYNTHETIC RESINS

Walter Frankenburger, Herbert Hammerschmid, and Georg Roessler, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application January 30, 1937, Serial No. 123,293. In Germany February 5, 1936
4 Claims. (Cl. 260—130)

1. A process of producing synthetic resins which comprises condensing aliphatic aldehydes containing from 2 to 4 carbon atoms by means of a substance of the group of primary and secondary alkyl- and aralkylamines, secondary heterocyclic bases and their salts with weak acids and treating the resulting resinous products with formic acid while boiling.

2,101,333

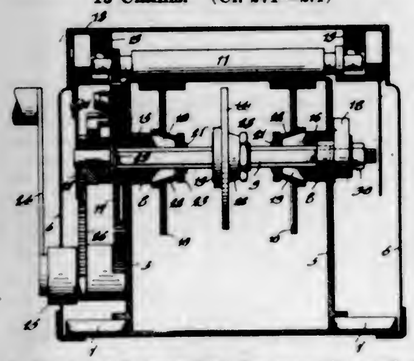
PROCESS OF PRODUCING SYNTHETIC RESINS

Walter Frankenburger, Herbert Hammerschmid, and Georg Roessler, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application January 30, 1937, Serial No. 123,292. In Germany February 5, 1936
6 Claims. (Cl. 260—130)

1. A process of producing synthetic resins which comprises condensing aliphatic aldehydes

containing from 2 to 4 carbon atoms by means of a substance of the group of primary and secondary alkyl- and aralkylamines, secondary heterocyclic bases and their salts with weak acids, distilling off the readily volatile oils formed and treating the resulting resinous products with inorganic condensing halides at temperatures of between 80° and 250° C.



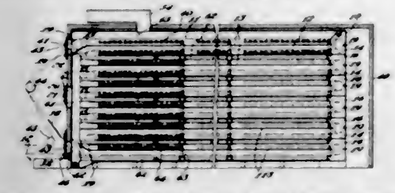
5. A process of producing synthetic resins which comprises condensing aliphatic aldehydes containing from 2 to 4 carbon atoms by means of a substance of the group of primary and secondary alkyl- and aralkylamines, secondary heterocyclic bases and their salts with weak acids, distilling off the readily volatile oils formed and treating the resulting resinous products with boron fluoride at temperatures of between 80° and 250° C.

2,101,334

STRIP FEEDING MECHANISM FOR WRITING MACHINES

Walter Elmer Gochnauer, Dover, N. H., assignor to American Sales Book Company, Inc., Niagara Falls, N. Y., a corporation of Delaware

Application August 1, 1935, Serial No. 34,242
13 Claims. (Cl. 271—2.4)



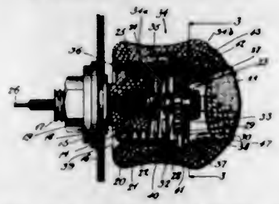
1. In a feed assembly for machines of the character described, in combination, a rotatably supported feed shaft, a plurality of feed disks mounted on said shaft in spaced relation and adjustable along the shaft, and a gripping device including a contractible hub for holding each of said disks in its operative adjusted position on the shaft.

2,101,335

ART OF DRYING MATERIALS

Chester S. Jennings, Syracuse, N. Y., and Frank W. Gerard, Dayton, Ohio, assignors to The Lamson Company, Syracuse, N. Y., a corporation of Massachusetts

Application September 17, 1934, Serial No. 744,332
1 Claim. (Cl. 34—24)



The steps in the drying of material which is conveyed into a housing having a plurality of connected compartments therein, through said compartments and out of the housing, which comprise subjecting the material to radiant heat as it passes through the compartments, the heat in the compartment first traversed by the material being greater than that in the compartment last traversed, setting up an air stream in the housing which flows through the compartments thereof in contact with the material and in the direction opposite to that in which the material travels, supplying conditioned air to the housing to constitute the initial portion of the air stream and supplying additional air to the housing at an intermediate compartment, which mingles with the conditioned air to constitute the final portion of the air stream, said additional air increasing the effectiveness of the air stream which at that point had been reduced below the effectiveness of the conditioned air as it was supplied to the housing due to the moisture absorbed by the air stream in drying the material with which it had been in contact in the compartments it had flowed through before reaching the compartment at which the additional air was supplied, whereby drying of the material is performed by the air stream in two stages, first by the mingled air which constitutes the final portion of the air stream and second by the conditioned air which constitutes the initial portion of the air stream.

2,101,336

CIGAR-LIGHTER

Arthur A. Johnson, Bridgeport, Conn., assignor to Casco Products Corporation, Bridgeport, Conn., a corporation of Connecticut

Application January 9, 1929, Serial No. 331,163
Renewed May 5, 1937
5 Claims. (Cl. 219—32)

1. A cigar-lighter heating element comprising a coil of high resistance wire adapted to be brought to incandescence when connected to a suitable source of current, and a metal disk on which said coil is supported, and a spider attached to said disk, said spider and disk having a sight-opening therein so that the degree of incandescence of the coil may be ascertained whether the disk is viewed from the obverse side on which the coil is supported or from the reverse side.

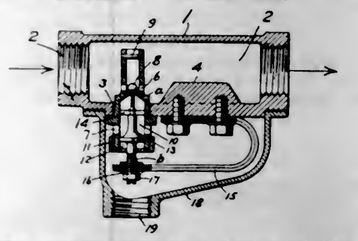
2,101,337

LOCKABLE HASP FASTENER

Albert J. Komenak, Stamford, Conn., assignor to The Excelsior Hardware Company, Stamford, Conn., a corporation of Connecticut

Application December 19, 1934, Serial No. 758,179
3 Claims. (Cl. 70—9)

1. Fastener devices for a hinged trunk lid having a front wall adapted to swing downwardly and edgewise into closed relation to the under body of the trunk, comprising a hasp pivotally mounted on the lid wall and disposed in a substantial portion of its length to overlie the same and in the remainder of its length to overlap the trunk body, keeper means rigidly positioned on the trunk body proximate the closed edge of the lid wall, a lock carried by the hasp in the portion thereof which overlies the lid wall including a bolt projecting downwardly toward said trunk body to engage with the keeper means, and a toggle tongue carried by the hasp in the portion thereof which overlaps the trunk body and projecting upwardly toward the trunk lid to engage with the keeper means.



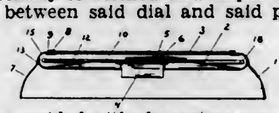
2,101,338

TEMPERATURE RELIEF VALVE DEVICE

Luther D. Lovekin, Villa Nova, Pa., assignor to Kitson Company, Philadelphia, Pa., a corporation of West Virginia

Application January 4, 1935, Serial No. 331
3 Claims. (Cl. 251—128)

3. The combination in a device of the type specified, of waste and fluid ways having a common wall, a tubular fitting extending through the wall and having peripheral inlet openings and a ball valve seat and a ball cage in the fluid way and having peripheral discharge openings and a plunger chamber in the waste way, a ball arranged in the cage for freedom of movement and adapted to be normally seated by fluid pressure, and a plunger arranged in the chamber and provided with a spider guide and with a head cooperating with said discharge openings to form a dashpot, said plunger being arranged to operate directly on the ball, there being a provision for lost motion between the ball and plunger.



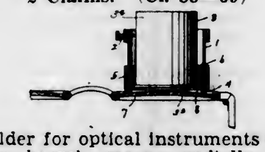
2,101,339

LUMINOUS CLOCK

Frank Edward Montroy, Los Angeles, Calif.

Application May 4, 1936, Serial No. 77,677
3 Claims. (Cl. 240—2.1)

1. In an illuminated clock, a dial, a transparent plate positioned in front of and a short distance from said dial, hands between said dial and said plate, and a luminous tube around the edge of the assembly so formed and disposed to radiate light between said dial and said plate, said dial being provided with characters annularly disposed therearound, the annular portion thereof including said characters being beveled away from said plate from the central region of said dial toward said tube.

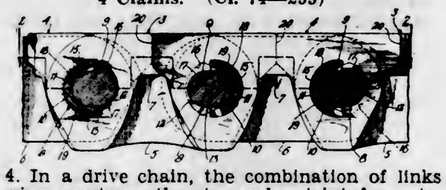


2,101,340

HOLDER FOR OPTICAL INSTRUMENTS

Adolphus W. Owens, Houston, Tex.

Application August 6, 1935, Serial No. 34,889
2 Claims. (Cl. 88—39)



1. A holder for optical instruments comprising a tubular barrel, means radially adjustable through the wall of the barrel for engaging and holding an optical instrument, cushioning material fitted over and embracing one end of the barrel, outer and inner clamp rings clamping said cushioning material in place, the inner clamp ring having an inwardly extending annular ledge forming a stop upon which the optical instrument may rest.

2,101,341

DRIVE CHAIN

David Barnes Perry, Ithaca, N. Y., assignor to Morse Chain Company, Ithaca, N. Y., a corporation of New York

Application October 25, 1935, Serial No. 46,669
4 Claims. (Cl. 74—255)

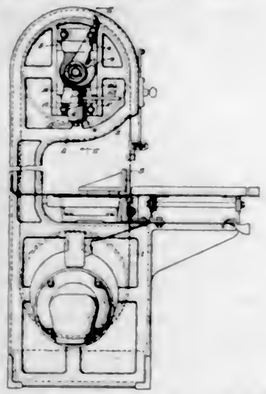
4. In a drive chain, the combination of links having apertures therein, and a joint for pairs of said links comprising a pin which in cross-section has semi-circular end portions of the same radius connected by a flat portion the flat surfaces of which merge tangentially with the curved surfaces of said semi-circular end portions, said flat surfaces constituting keying surfaces for keying the pin in one link to rotate therewith, and the connected link having a concave bearing surface corresponding in radius to the radius of the semi-circular portions of the pin, and said pin being disposed in the links with its major axis cross-sectionally considered extending in the direction of the major axes of the links.

2,101,342

DUPLEX ENVELOPE

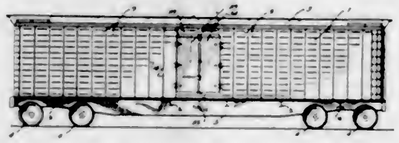
Charles F. Pflanze, University City, Mo.

Application March 9, 1936, Serial No. 67,844
1 Claim. (Cl. 229—72)



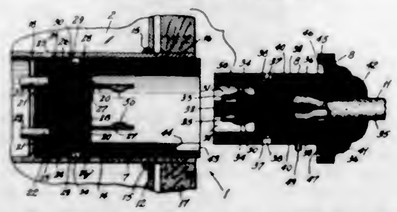
A duplex envelope comprising a relatively large rectangular compartment for printed matter re-

quiring less than first-class postage, provided with a closure flap and a window on the same side as said closure flap, and a relatively small, rectangular letter compartment also provided with a closure flap, said latter closure flap being secured on the inside of the closure flap of said large compartment prior to closure of said large compartment, said small letter compartment having a window in one side thereof opposite



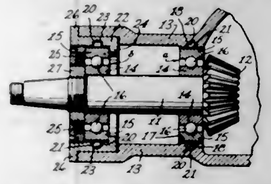
the side to which the said closure flap is secured, said windows in both the large and small compartments registering with each other so that one address applied to the small compartment is sufficient for both kinds of mail matter, means for accessibly closing the large compartment, means for holding said small compartment against the inner front wall of the large compartment, substantially as described.

2,101,343
TENSIONING APPARATUS FOR MEAT AND BONE CUTTING MACHINES
Fortunat Ponton, Chicago, Ill., assignor to Vaughan Company, Chicago, Ill., a corporation of Illinois
Application April 20, 1936, Serial No. 75,335
3 Claims. (Cl. 143—27)



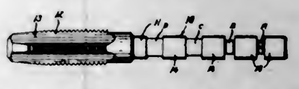
1. In combination with a pair of band saw wheels and a rotatable cam operatively connected with one of said wheels whereby rotation of the cam in one direction moves that wheel away from the other, a reciprocable abutment member against which the cam slides during its rotation, a spring supporting said member yieldably thrusting said member against said cam, a rotatable and reciprocable cage for retaining said abutment member against sideways movement and retaining one end of said spring, and means cooperating with said cage in different angular positions thereof for retaining said cage selectively in a plurality of positions at different distances longitudinally along the center to center line of said wheels.

2,101,344
CARRIER VEHICLE STRUCTURE
Damian L. Reynolds, Burlingame, Calif.
Application February 11, 1935, Serial No. 6,049
7 Claims. (Cl. 105—409)



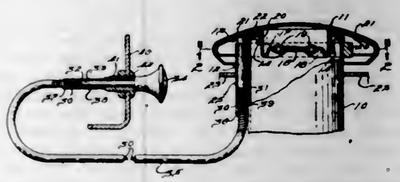
1. In a super-structure, including a roof structure, for a cargo car having an underframe, an exterior wall formed of a plurality of sheet metal sections with channel shaped sides and a vertical front surface with deformed portions to provide stiffness, means for connecting the adjoining sides of adjacent sections, a metallic sealing member between said sides adapted to be deformed to close the joint of the sides after assembly, the connected sides forming posts, said posts terminating on top of the under frame, brackets connecting the posts and the underframe, the front surface of the section extending below the top of the underframe and being secured to said underframe, and a continuous top member secured to the tops of said sections and adapted to support the roof structure.

2,101,345
ELECTRIC CONNECTER PLUG
Lee Hunter Riley, University City, Mo.
Application March 20, 1936, Serial No. 69,811
1 Claim. (Cl. 173—328)



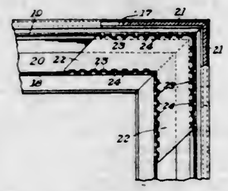
An electrical connecter plug comprising a tubular socket member having an end wall, resilient electrical contact members projecting from said end wall into the socket of said member, and a plug member fitting in said socket, said plug member having recesses in its end and electrical contact members in said recesses for external engagement with the respective contact members of the socket members, said contact members all having curved contact bosses, said socket member having a longitudinal slot at its outer end and an angular slot communicating with said longitudinal slot and said plug having a pin for cooperation with said slots and having an annular peripheral rib forming a channel between itself and the body of the plug and springs in said channel bearing against the end of the socket member for resisting separation of the parts.

2,101,346
BALL BEARING MOUNTING
Benjamin C. Robertson, Los Angeles, Calif.
Application October 15, 1935, Serial No. 45,089
3 Claims. (Cl. 308—184)



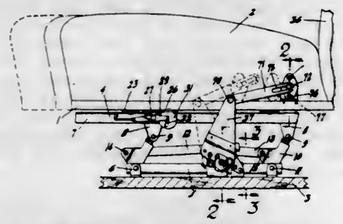
1. In combination with an anti-friction bearing having an inner and outer race; a bearing mounting having a bearing receiving opening with an annular groove therein, and an annular coil spring in said groove having a bearing contacting surface inwardly of the mounting, said spring in cross section being formed with a substantially flat portion forming the bearing contacting portion.

2,101,347
TAP
Willard C. Robinette, Pasadena, Calif.
Application June 24, 1936, Serial No. 86,968
3 Claims. (Cl. 10—141)



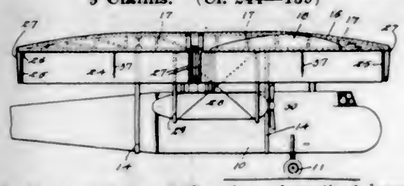
2. In a tap, a shank and a fluted threaded head portion, said shank including weakened portions, said shank including polygonal portions adjacent to the weakened portions, said weakened portions being of progressively increasing strength towards the head.

2,101,348
RADIATOR OR GAS TANK CAP LOCK
Theodor Schellinger, Detroit, Mich., assignor to C. H. Oshel, Detroit, Mich.
Application May 20, 1935, Serial No. 22,323
2 Claims. (Cl. 220—55)



1. The combination with a container spout and a cap securable over the end thereof, said cap having a skirt portion which projects outwardly from and in spaced relation to said spout with a marginal skirt portion lying closely adjacent said spout, of a locking keeper positioned within said cap, a retractable bolt associated with said keeper, and means for slidably supporting said bolt on said spout for movement into and out of the path of said keeper, comprising a member disposed to surround said spout and positioned within said skirt portion, and a connection between said member and said spout.

2,101,349
JOINING LENGTHS OF METAL
Henry J. Sharp, Emsworth, Pa., assignor to Commonwealth Trust Company, trustee, Pittsburgh, Pa.
Application April 7, 1934, Serial No. 719,475
14 Claims. (Cl. 189—36)



1. A framing construction comprising framing strips having mitred ends which abut, each strip having a border portion and a side portion, each of said portions having a longitudinally extending channel therein, a connector comprising a rigid angle member in each of said channels having the legs thereof received in the channels of the abutting strips, at least one side of one of the channels and one edge of one of the connectors having interlocking portions.

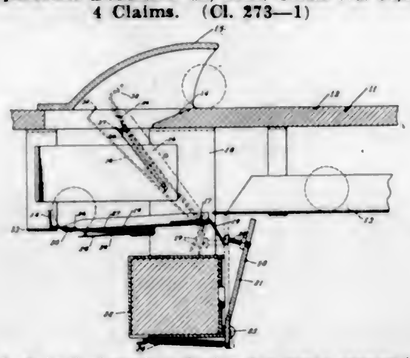
2,101,350
SEAT ADJUSTER
Emory Glenn Simpson and Andrew Christian Andersen, Detroit, Mich., assignors to Ternstedt Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application May 28, 1936, Serial No. 82,286
15 Claims. (Cl. 155—88)

10. In an automotive vehicle body, a seat, an extensible support for the seat comprising a pair of rails spaced laterally of the seat bottom and extending fore and aft of the seat, a pair of parallel levers for each rail spaced lengthwise of the rail and each of which is pivotally connected at one end to the rail and at the other end to the floor of the vehicle body, operative connections between the seat and the said support rails for reciprocably mounting the seat on the extensible support, a rotatable shaft extending laterally of the seat between the seat and the floor, a gear fixed on the shaft, a rack bar meshed with the said gear and pivotally connected with one or more of the said parallel support levers, a lever freely rotatably mounted upon the said shaft, a pawl and ratchet clutch mounted between the said lever and shaft for interconnecting the shaft and the said lever, and a link having operative connections with the seat and with the said lever, one of said operative connections having a lost motion connection whereby reciprocatory motion of the said seat is transmitted by the said link to the said lever to raise or lower the said seat.

2,101,351
AEROPLANE
Roy R. Slayback, Decatur, Ill.
Application August 6, 1936, Serial No. 94,713
9 Claims. (Cl. 244—139)

1. An aeroplane of the class described having a fuselage, a main supporting plane therefor, normally retracted means on the main plane operable to convert the same into a parachute, means to propel the aeroplane, and means operable to control the position of the first mentioned means through the operation of the second mentioned means.

2,101,352
DEHYDRATOR
Frank Y. Takenaga, Anaheim, Calif.
Refiled for abandoned application Serial No. 695,877, October 30, 1933. This application April 16, 1935, Serial No. 16,704
5 Claims. (Cl. 34—19)



1. In a dehydrator, independent dehydrating chambers having open ends, and heated air intake and discharge openings with the latter located at the lower side of said chambers adjacent said ends, doors at said ends being inclined and disposed to deflect the air streams entering and discharging from said chambers, an air heater, and means for circulating hot air streams through said chambers either through one chamber back to the heater and from thence through the other chamber or through the last named chamber only.

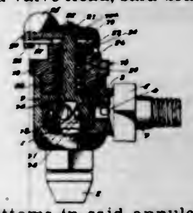
2,101,353
CONVEYER MECHANISM
Gerrit Waalkes, Highland Park, Mich., assignor to Anchor Steel and Conveyor Company, a corporation of Michigan
Application March 25, 1936, Serial No. 70,755
1 Claim. (Cl. 104—172)

In a conveying mechanism, a conveyer chain having alternate inner links connected to outer links pivotally connected to the outer sides of the inner links at their ends, said inner links being similar in shape to each other, said outer links being similar in shape to each other, and a driving dog mounted between the sides of the outer links, said outer links having openings therethrough substantially at their centers intermediate the points of connection of said outer links with said alternate inner links, said dog having a pivot portion extending transversely of the conveyer chain and being of a width slightly less than the distance between the inner sides of the outer links and having pivot pins extending through said center openings of said outer links.

2,101,354
GAME APPARATUS
Harry E. Williams, Chicago, Ill., assignor to Rock-Ola Manufacturing Corporation, Chicago, Ill., a corporation of Delaware
Application December 13, 1935, Serial No. 54,201
4 Claims. (Cl. 273—1)

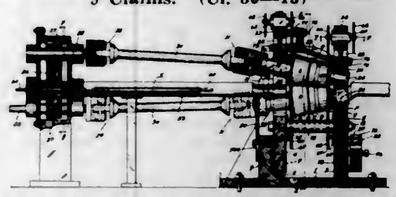
2. A ball elevating device for game apparatus and the like, said device comprising a pivotally mounted elevating arm having a lever arm extended at an angle thereto adjacent the pivotal mounting aforesaid, and means for pivoting said arm including an electro-magnet having a pivotally movable armature adapted to contact said lever arm at decreasing radial distances from the said pivotal mounting of said carrier arm when the armature is attracted by said electromagnet whereby the pivoting force applied to said lever arm by said electro-magnet will be decreased as said carrier arm is moved in elevation operation.

2,101,355
TAPE CARTON
Charles E. Wonder, Chicago, Ill., assignor to Van Cleef Bros., Chicago, Ill., a partnership composed of Noah Van Cleef, Maxime Van Cleef, Felix Van Cleef, and Paul Van Cleef
Application September 8, 1936, Serial No. 99,703
2 Claims. (Cl. 206—52)



1. A carton for retaining and holding a roll of tape or like article, comprising a side having a central opening therein, a second side positioned opposite and in spaced relation to the first mentioned side, end walls extending between the end margins of the sides, a top and bottom extending respectively between the top and bottom margins of the sides and forming with the sides and the end walls a compartment for the roll, an annular series of tongues connected to and extending inwardly from the opening defining margin of said first mentioned side and serving to form a centering band within the core of the roll, a removable ring extending through said opening and within the tongues and arranged to hold the tongues in their band forming position, and a flap hinged to the top and adapted to be swung into a position wherein it overlies said first mentioned side and operates to hold the ring against axial displacement.

2,101,356
ORIFICE DIAL VALVE
William Zak, San Francisco, Calif.
Application April 19, 1937, Serial No. 137,802
5 Claims. (Cl. 251—92)



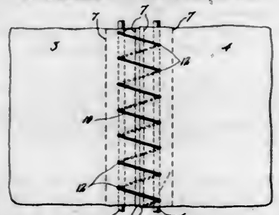
1. In an orifice dial valve, the combination of

a casing, a single-piece valve plug in said casing, said valve plug provided with an integral hollow head, said head provided in its bottom with an integral annular inwardly-extending flange, said valve head provided on its inner face with integral side braces extending inwardly from the inner wall of said valve head, said braces terminat-

ing at their bottoms in said annular flange, said hollow head provided with apertures and communicating slots in its sides, said apertures and slots being equal in number, said slots extending below said annular flange and to the bottom face of said hollow head, and means connected to said valve plug for manually operating same.

2,101,357
CROSS-ROLL MILL
Walter J. Assel, Canton, Ohio, assignor to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio
Application May 28, 1934, Serial No. 727,934
9 Claims. (Cl. 80—13)

1. A tube rolling mill comprising a frame, a housing for the working rolls mounted on said frame and comprising end members, which are substantially parallel and relatively angularly adjustable, cradle members having universal connections with said end members and constituting seats for the working rolls, working rolls with their necks in said seats and arranged with their axes askew with relation to the planes of the axis of the mill, said housing also comprising spacing members between said end members and detachable means for securing said members together, one of said end members having an arcuate bottom fitting arcuate seats on said frame, and means for turning said end member on said seat to change the angular relation of said end member with relation to the other end member of the housing.



2,101,358
METHOD OF MAKING LOAD SUSTAINING STRUCTURES
Charles S. Boardman, Pittsburgh, Pa., assignor to Jones & Laughlin Steel Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application May 28, 1937, Serial No. 145,173
9 Claims. (Cl. 61—50)

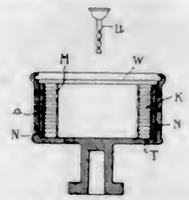
1. The method of making a load sustaining structure in earth which comprises sinking a cell from the surface into a substratum, removing earth above the substratum from within the cell, and substantially simultaneously charging divided material into the cell to replace the removed earth, the divided material being of a

character to resist the pressure of the surrounding earth.

2,101,359
CARPETING
Daniel Butler Bonner, Philadelphia, Pa.
Application December 18, 1935, Serial No. 54,967
3 Claims. (Cl. 112—262)

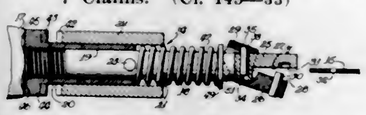
1. A floor covering comprising a plurality of strips of carpet, said strips having pliant wires adjacent their longitudinal edges extending with the warp, and means for securing said strips together comprising stitches embracing the adjacent wires of adjacent strips, said stitches being concealed by the pile of the carpet.

2,101,360
CAR ROOF
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application June 30, 1937, Serial No. 151,081
10 Claims. (Cl. 108—5.2)



1. In a car roof, a series of plates embodied therein and having portions extending below the underside thereof provided with downwardly opening notches, said plates being provided adjacent to said notches with outstanding flanges, members disposed beneath said roof and extending transversely of said plates through the notches therein, and means for securing said members to said flanges.

2,101,361
PROCESS FOR THE DIRECT PRODUCTION OF ARTIFICIAL SILK IN WOUND FORM SUITABLE FOR THE TEXTILE INDUSTRY
Benno Borzykowski, Paris, France, assignor to Borvisk Syndicate Ltd., London, England
Application March 28, 1929, Serial No. 350,706. Renewed November 1, 1935. In Germany May 11, 1928
4 Claims. (Cl. 18—54)



1. In the manufacture of artificial silk and

like formations by the spinning can method, subjecting the cake to fluid treatment in the can

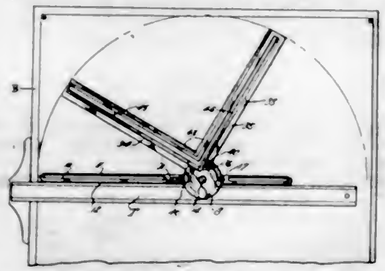
while having its inner layers protected against damage and subsequently drying the cake while having its inner layers similarly protected.

2,101,362
HACKSAW
Jack H. Davidson, Chicago, Ill., assignor to Armstrong-Blum Mfg. Co., Chicago, Ill., a corporation of Illinois
Application March 30, 1936, Serial No. 71,565
7 Claims. (Cl. 145—33)

7. A blade holder for hack saws comprising, a stem having a fixed clamping jaw rigid therewith with a flat clamping face extending longitudinally from an end of said stem, a movable clamping jaw in opposed relation to the fixed jaw, means for pivotally supporting said movable jaw for movement toward and away from said fixed jaw, said movable jaw having a pair of angularly disposed bearing surfaces on the rear end thereof, and means including a helical compression spring surrounding said stem and bearing alternatively against said bearing surfaces for releasably preventing relative movement between said jaws.

2,101,363
SANITARY TOOTH CLEANSER
Lester L. De Rome, Chicago, Ill.
Application July 2, 1936, Serial No. 88,562
2 Claims. (Cl. 15—227)

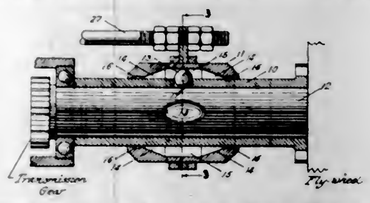
1. A sanitary tooth cleanser, comprising a single piece of textile fabric having a narrow elongated part, one end of which is a wider part that extends back part way over the narrow part, with its side portions overlapping the narrow part to form a finger cot, and a pile fabric pad lying upon and secured to the side portions of the wide part and the underlying narrow part by one and the same fastening means.



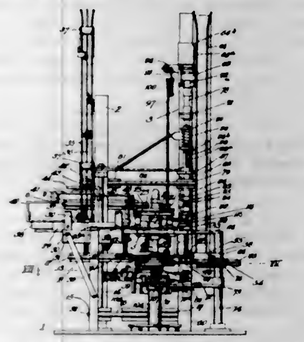
2,101,364
NECK CONSTRUCTION FOR A STRINGED MUSICAL INSTRUMENT
Rudolph Dopyera, Los Angeles, Calif.
Application June 6, 1936, Serial No. 83,882
7 Claims. (Cl. 84—293)

1. In a stringed musical instrument, a body having a top and bottom member and a side wall, a transverse member on said bottom and spaced from said side wall, a second transverse member in said body adjacent the side wall, a neck having a foot piece thereon engaging said second transverse member, said foot piece having a projection thereon, said second member being

slotted and said projection fitting in said slot, said projection having an apertured boss therein, a screw passing through said boss and secured in said first transverse member.



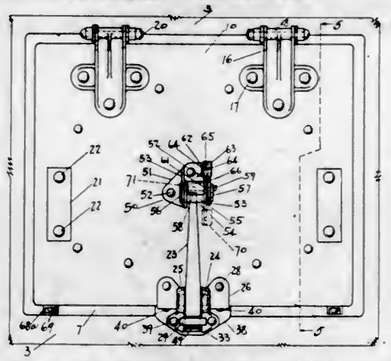
2,101,365
DRAFTING INSTRUMENT
Tony T. Erickson, South Hibbing, Minn.
Application April 5, 1937, Serial No. 134,961
1 Claim. (Cl. 33—93)



In a device of the kind described, a flat protractor base bar, a protractor disk of substantially greater diameter than the width of the base bar rotatably mounted upon the base bar, the disk being demarked upon its predetermined upper face with a pair of diametrically oppositely positioned quadrants doubly calibrated and with the calibrations reversely numbered from zero to ninety degrees from right to left and from left to right, there being a right angled portion cut out of the disk through its periphery at one side immediately between the pair of quadrants demarked as aforesaid and at one end of the space intervening thereinbetween, the sides of the right angled cut out being extended in spaced and parallel relation to a right angle having its vertex coinciding with the center of the point of rotation of the protractor disk, and a flat, right angled scale and square element mounted at its corner underneath the margins of the right angled cut of the disk and in exact registry therewith and detachably secured thereto by screws passed down through said margins into the element, and means for releasably locking the protractor disk in any set position of rotation.

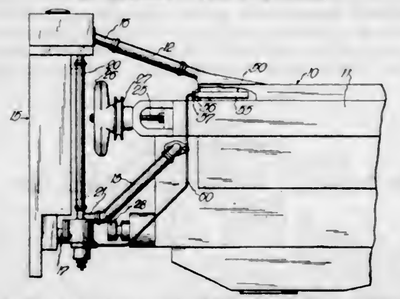
2,101,366
CLUTCH DEVICE
Nathan Frank, Newark, N. J., assignor to Febod Corporation, Newark, N. J., a corporation of New Jersey
Application February 23, 1935, Serial No. 7,723
2 Claims. (Cl. 192—71)

1. A bilaterally operative automobile clutch device comprising two concentric shafts, a plurality of spherical locking members, a sleeve coupling for effecting alternately a driving and a non-driving connection between said shafts through the intermediary of said locking members, the interior of said sleeve being formed into two conical surfaces the bases of which are separated by a substantially cylindrical shaped section, all of said members being arranged in such cooperative relationship that limited longitudinal movement of said sleeve in either direction effects through the coaction of said conical surfaces with said spherical locking members a driving engagement of said clutch and limited longitudinal movement in the opposite direction effects a disengagement of said clutch and a groove located at the apex of each conical surface adjacent the edges of said sleeve for cooperation with said spherical locking members.



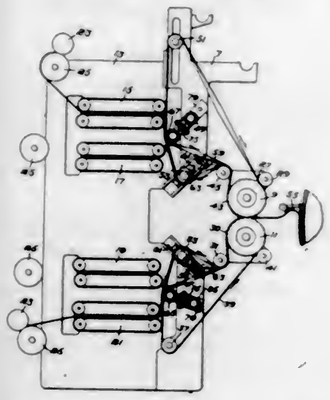
2,101,367
NUT AND BOLT ASSEMBLING MACHINE
Harry H. Gray, Kansas City, Mo.
Application July 27, 1936, Serial No. 92,808
16 Claims. (Cl. 10—155)

1. A method of securing threaded bolts and nut members together when their longitudinal axes may not be in full alinement, which consists in holding one of the members with the axis of its threaded portion in a vertical plane, bringing the threaded portion of the second member into abutment with the corresponding portion of the first member without any telescopic relation between the members and while holding said second member loosely to permit of change of position of its axis without change of position of the holding means, and finally in imparting relative rotation to the members in such direction as to thread the two members together.



5. A rotary circular table having uniformly spaced peripheral recesses, means for feeding upright bolts laterally to dispose their stems within said recesses successively, means for holding said bolts with their heads spaced above the rotary table for a part of the revolution of the latter and for releasing the bolts to permit them to drop downwardly at a predetermined point, and means to feed nuts successively sidewise to a position where their bores are in line to receive the released bolts to effect engagement between the bolts and nuts.

2,101,368
REFRIGERATOR HATCH ARRANGEMENT
August William Louis Hartbauer, Chicago, Ill.
Application April 6, 1934, Serial No. 719,358
22 Claims. (Cl. 105—377)

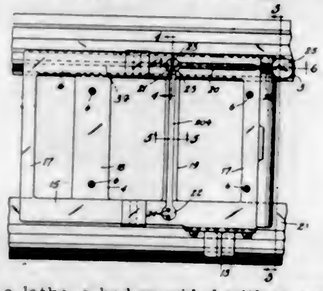


1. In a refrigerator car the combination of a hatch frame, a cover for said frame, a gasket interposed between said cover and said frame, said cover being suspended above said frame and gasket by means of hinges at one side of said cover and opening and closing means at the opposite side of said cover, the said gasket contacting the top surface of the hatch frame, said opening and closing means including a pair of links, said links being operated by a lever, one end of which is secured in a bearing, which bearing is secured to the hatch cover, the other end of the lever being adapted to be locked and unlocked in locking means secured to said cover.

2,101,369
THERMOSTATIC CONTROL FOR INTERNAL COMBUSTION ENGINES
Clarence H. Jorgensen, Elmhurst, Ill., and Peter J. Jorgensen, deceased, late of Elmhurst, Ill., by Clarence H. Jorgensen, administrator, Elmhurst, Ill.
Application October 23, 1933, Serial No. 694,814
47 Claims. (Cl. 123—178)

1. In a system embodying a motor, interconnected fluid flow conduit means having at least a portion extending in thermal relation with said motor, and means normally operative to vary the temperature of at least a portion of the fluid flowing through said conduit means and including shiftable means, the method of controlling the operation of said temperature varying means which comprises shifting said shiftable means in response to simultaneous functions of the temperatures at two spaced apart points in said conduit means.

2,101,370
TAPE CONDENSER
Henry H. Knight, Canton, Mass., assignor, by mesne assignments, to Davis & Furber Machine Company, North Andover, Mass., a corporation of Massachusetts
Application June 1, 1936, Serial No. 82,894
11 Claims. (Cl. 19—151)



11. A tape condenser comprising a pair of dividing rolls, a first and second pair of condensing aprons, a series of tape runs acting each to carry a separate sliver from the dividing rolls and deliver said sliver to said first pair of aprons, a second series of tape runs, the members of which alternate with the members of said first series, acting each to carry a sliver from said dividing rolls and deliver it to said second pair of aprons, roller guiding means engaging adjacent tape runs of said two series and controlling their position to maintain them either in close lateral proximity or in substantial separation as desired, and means for altering the path of said second series of tape runs to cause them to deliver each its sliver to said first pair of aprons, said means comprising a guide roll engaging said second series of tape runs and movable to retract said tape runs with relation to said second pair of aprons and acting in retracting said tape runs to bind the latter more firmly against said roller guiding means.

2,101,371
OIL RECOVERY
Vicente G. Lava, Manila, P. I.
No Drawing. Application October 15, 1937, Serial No. 169,144
15 Claims. (Cl. 87—6)

1. A process for the recovery of oil from the cocoanut which comprises comminuting cocoanut meat without a substantial rupturing of the cell structure, admixing with water, pressing the admixture of meat and water whereby an oil-in-water emulsion is formed, and subsequently separating oil from the emulsion.

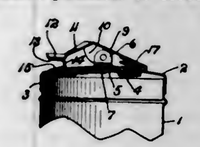
2. A process for the recovery of oil from the cocoanut which comprises comminuting cocoanut meat without a substantial rupturing of the cell structure, admixing with water at a temperature of about 22° to 100° C., pressing the admixture of meat and water at a temperature of about 22° to 60° C., whereby an oil-in-water emulsion is formed, and subsequently separating oil from the emulsion.

2,101,372
LATHE
Max A. Lehmann, Richmond Heights, Mo., assignor to Lehmann Machine Company, St. Louis, Mo., a corporation of Missouri
Application November 20, 1935, Serial No. 50,705
2 Claims. (Cl. 82—31)

1. In a lathe, a bed provided with spaced parallel ways and an open-work supporting frame comprising side frame members slidably supported on the respective ways and connected by cross-frame members, said frame having a lubricant containing groove in its upper surface that extends longitudinally of one of said side frame members and thence along one of said cross-frame members to the other of said side frame members, said groove having enlarged pocket portions located in the respective side frame members opposite the ends of said cross-frame member, said side frame members having discharge passages therein that lead downwardly from the enlarged pocket portions therein to the respective slideways.

2,101,373
PARASITICIDAL SPRAY COMPOUND
Frank F. Lindstaedt, Oakland, Calif.
No Drawing. Application June 13, 1934, Serial No. 730,469
4 Claims. (Cl. 167—27)

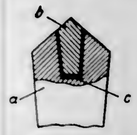
1. A horticultural spray compound, comprising a mixture of hydrocarbon oil and tung oil in a proportion effective to retard penetration of the hydrocarbon oil into the pores of plants and the like when the mixture is deposited on the surface thereof.



2,101,374
CHOCOLATE MALTED MILK FOOD PRODUCT AND PROCESS OF FORMING SAME
Martha E. Tucker, Grand Rapids, Mich.
No Drawing. Application August 19, 1937, Serial No. 159,963
2 Claims. (Cl. 99—27)

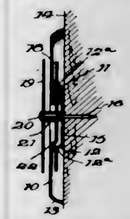
1. A method of making a sterilized chocolate flavored malted milk food product, including mixing cream, milk concentrate, cocoa, malted milk, a stabilizer, and water, proportioning the ingredients so that the ratio of serum solids to butter fat is slightly in excess of one, heating the mixture to a temperature between 190° F. and 200° F. to cause the starches of the cocoa and malted milk to flow, homogenizing the mixture at the starch flowing temperature, and sterilizing the mixture.

2,101,375
POWDER DISPENSER
Anthony Vanderveld, Grand Rapids, Mich.
Application June 29, 1936, Serial No. 87,848
7 Claims. (Cl. 221—61)



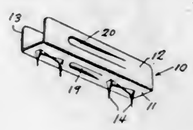
1. In a device of the class described, a container having an outlet opening in a wall thereof,

a closure member movably mounted on the container and having a closure element to close said opening, yielding means acting on the closure member for normally holding said closure element in operative position to close said opening,



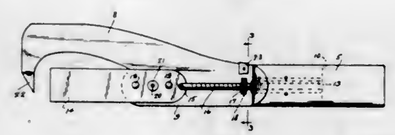
and a scoop connected to the closure element and adapted to pass through said opening in the container, said scoop being withdrawn from the container and carried outwardly through said opening on moving the closure member to move said closing element away from said opening.

2,101,376
PERCUSSIVE BORING TOOL
Hermann Voigtländer, Essen, Germany, assignor to N. V. Wallramit Handel Maatschappij, Rotterdam, Netherlands
Application September 25, 1935, Serial No. 42,130
In Germany October 9, 1934
6 Claims. (Cl. 255—63)



1. A percussive stone-boring tool consisting of a tool shaft having a recess at the boring end thereof with side faces tapering away from each other toward the boring end of the tool, a hard metal wedge-shaped inset in the recess having a cutting edge and side faces tapered to correspond to the tapered faces of the shaft, and a soft and elastic support between the tapered side faces and the inner end of the inset and the bottom of the recess, said support forming a solid welded or soldered metallic connection between the tool shaft and the inset and the side support being thinner than the bottom support.

2,101,377
CURTAIN TIE-BACK SECURING DEVICE
Walter S. Weldon, Maryland Heights, Mo.
Application February 1, 1937, Serial No. 123,441
5 Claims. (Cl. 156—33)



1. In a curtain tie-back securing device, a base member, means for securing said base on a window trim, said base having a depression therein with slots at opposite sides of the depression, a button removably secured in said slots, and means for attaching the tie-back to said button.

2,101,378
PARTITION ASSEMBLING AND RETAINING FIXTURE
Alfred Wiskoff, Evanston, Ill.
Application August 3, 1936, Serial No. 94,119
4 Claims. (Cl. 217—7)

1. As a new article of manufacture, a partition accommodation and holding fixture substantially channel-shaped in cross-sectional form, the web portion thereof being provided with integral struck-out anchoring prongs and one of the side walls thereof being provided with an inwardly projectable resilient partition contacting and retaining finger.

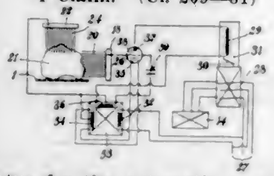
2,101,379
LATHE TOOL
Joseph Zackowitz, Flushing, N. Y.
Application April 16, 1937, Serial No. 137,354
1 Claim. (Cl. 142—56)

In a tool of the class described, a cutter member provided at one end with a tang, a handle secured to the tang and cutter member, said cutter member at the end thereof remote from said tang provided with a nose having a cutting edge, said tang having a longitudinal slot, a gauge-slide plate having at one end thereof a threaded shank, said gauge-slide also having extending laterally from one side thereof projections operating in said slot, whereby to constrain said slide to move longitudinally of said tang and relative to said cutter, said tang being also provided with a transverse slot, and a nut threadedly engaged with said shank and arranged in said slot whereby upon turning of said nut said gauge-slide is shifted longitudinally of the cutter for adjusting the distance between the nose of the cutter and the free end of said slide, said handle being also provided with a longitudinal bore, whereby to accommodate the aforementioned shank of said gauge-slide, said nut being also provided with a knurled periphery, and a dog, of resilient material, anchored at one end to said tang and having a free end engaging the knurled periphery of said stud for securing the latter against casual displacement and said gauge-slide in the desired position of adjustment.

2,101,380
MECHANICAL ADJUSTABLE SHIRT
Roland Alston, Washington, D. C.
Application March 18, 1936, Serial No. 69,555
4 Claims. (Cl. 2—127)

1. In an adjustable shirt having a back portion and having sleeves and a collar band; an ex-

pansible plait disposed transversely in the collar



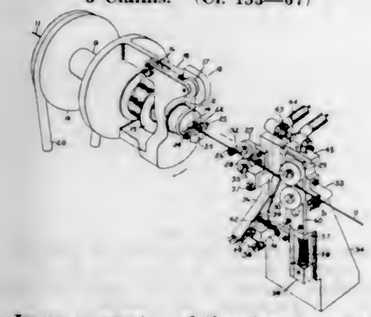
band and extending partly into the back; and means for adjusting the width of the plait.

2,101,381

APPARATUS FOR THE SEPARATION OF COAL AND THE LIKE

Kenelm Charles Appleyard, Birtley, England, assignor of one-half to The Birtley Company Limited, Birtley, England

Application September 13, 1933, Serial No. 689,322
In Great Britain May 11, 1933
1 Claim. (Cl. 209—81)



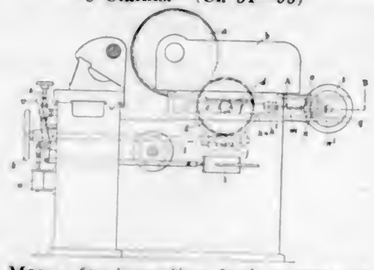
Apparatus for the automatic separation into classes of pieces of coal and the like according to their electrical resistance comprising an electrical circuit, a source of energy connected therewith only, two contact members, of which at least one is of a resilient nature, connected to the respective poles of said electrical circuit, means for causing the material to pass in single pieces between and to make electrical contact with said contact members, diverting means for presenting alternative paths to the pieces of material after they have passed said contact members and automatic means controlled by the current in said circuit for operating said diverting means, said two contact members being arranged to contact with each piece of material from directions substantially at right angles to one another.

2,101,382

SAFETY DEVICE FOR COILING MACHINES

John F. Donovan and George Illingworth, East Cleveland, Ohio, assignors to General Electric Company, a corporation of New York

Application May 7, 1936, Serial No. 78,385
5 Claims. (Cl. 153—67)



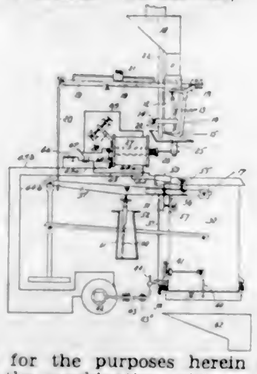
1. In an apparatus of the class described, the combination of means for coiling a wire, driving means for said coiling means, two members mounted adjacent said coiling means and adapted to engage the wire coil from opposite sides as it is produced, means for moving one of said members toward the other so that both of said members are pressed against the wire coil, means for causing the driving means to be inoperative when the members pass from the wire coil and are moved closer together on failure of the coiling operation and means located adjacent the two members and engaging the wire coil passing therefrom for keeping the wire coil from unwinding after the end of said wire coil passes therethrough.

2,101,383

PRECISION GRINDING MACHINE

Harry Hales Asbridge, Ashton-on-Mersey, England, assignor to The Churchill Machine Tool Company Limited, Broadheath, near Altrincham, England, a British company

Application October 28, 1936, Serial No. 108,077
In Great Britain November 12, 1935
9 Claims. (Cl. 51—95)



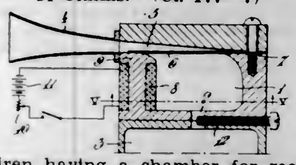
1. Means for imparting feed movements to a grinding wheel head comprising a hydraulic cylinder, a double acting plunger therein, toggle mechanism operated by said plunger, a slide, a grinding wheel on said slide, said slide being moved by said toggle mechanism, a dashpot, and means to bring said dashpot into operation to slow down the travel of said plunger at a predetermined point in the travel of the latter.

2,101,384

MEANS FOR USE IN AUTOMATICALLY WEIGHING PREDETERMINED QUANTITIES OF DISCRETE MATERIALS

Edwin Coubray, Auckland, New Zealand

Application March 26, 1936, Serial No. 71,025
In New Zealand May 18, 1935
7 Claims. (Cl. 249—32)



1. Means for the purposes herein described comprising the combination with an overhead storage bin having a delivery spout, a weighing scale beam having a receiving pan on one end disposed beneath the said spout, and means operable by the movement of the beam to control the delivery from said spout, to cause it to be opened when the pan end rises and to close when such end falls, of a tray disposed horizontally beneath the said spout to catch the material falling therefrom and to direct it into the weighing pan, and which tray is so mounted as to be adapted to be shaken reciprocally in a horizontal plane, an electric solenoid magnet to the pole piece of which the said tray is attached, a tipping switch controlling the supply of electric current to such magnet and mounted in association with the said scale beam to close when the weighing pan end is in the raised position and to open when such end falls, and detent apparatus for holding such switch in its closed position until the scale beam has dropped to its full extent.

2,101,385

AIR HORN

Olof Ingemar Harald Ekman, Stockholm, Sweden

Application October 31, 1935, Serial No. 47,685
In Sweden March 5, 1934
11 Claims. (Cl. 177—7)

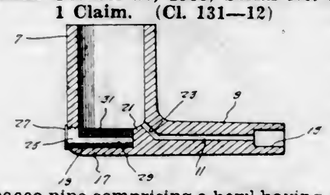
1. A siren having a chamber for receiving a fluid under pressure and an outlet leading from said chamber, a valve for controlling said outlet, electro-magnetic means for producing a retaining power acting upon the valve to keep same in closed position, said retaining power being of such a nature as to become reduced with increasing opening of the valve, said chamber having a restricted inlet to allow the fluid to generate in the chamber, a source of counter-power acting on the valve to open same, said counter-power being of such nature as to be alternately increased and decreased depending on the closing and opening of the valve, the strength, or the highest strength, of said counter-power being sufficient for overcoming the action of the retaining power.

2,101,386

SUBMARINE SIGNALING CABLE

Julius Engler and Ernst Studt, Nordenham, Germany, assignors to Norddeutsche Seekabelwerke A. G., Nordenham, Germany

Application June 16, 1933, Serial No. 676,196
In Germany June 25, 1932
1 Claim. (Cl. 173—264)



A submarine signaling cable with insulation consisting of several layers comprising a layer next to the conductors consisting of a liquid insulating material with low dielectric losses and low dielectric constant, a covering thereover of insulating thermoplastic material which is impermeable to water and retains its shape and a distancing member of pure polystyrol in the inner layer for holding the covering from the conductors.

2,101,387

SMOKING PIPE

Charles Arthur Facer, Bridgeport, Ohio

Application October 27, 1936, Serial No. 107,864
1 Claim. (Cl. 131—12)

A tobacco pipe comprising a bowl having a stem extending from one side thereof adjacent the bottom of the bowl cavity, the portion of said bowl which defines the bottom of the cavity being of substantially thick cross section and provided with a short bore leading inwardly to the cavity from a point on the side of the bowl substantially in axial alinement with the said stem and traversing the cavity for a major portion of its diameter, said stem having an axial bore communicating with the said cavity and being angularly offset at its inner end to enter the cavity at a higher elevation than the said short bore and being separated from the latter by a substantially narrow intervening portion of the pipe bowl, and a container having therein a removable absorbent material inserted in said bore.

2,101,388

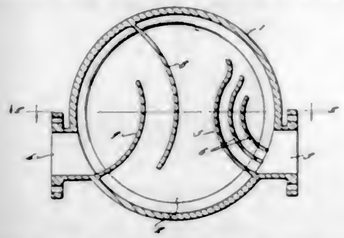
PROCESS OF CONSTRUCTING PAVEMENTS

Sam E. Finley, Atlanta, Ga.

Application February 7, 1935, Serial No. 5,485
7 Claims. (Cl. 94—23)

1. The process of constructing pavements comprising the depositing of a layer of mineral aggregate upon the surface to be paved, the application to the individual particles of aggregate, while in place in such layer, of a first coating of bituminous material liquid at atmospheric temperatures and substantially free from light volatiles, the application to such coated particles of a second coating of bituminous cement also free from light volatiles, and the subjecting of said layer of coated aggregate to pressure to cause amalgamation of said coatings to form a bituminous cement of higher penetration than said second coating.

2,101,389



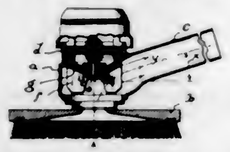
MUFFLER

Oliver C. Fischer, Waterloo, Ill., assignor of one percent to Robert L. Miller, one percent to Oscar J. Moffitt, one percent to Harold G. Horn, four percent to Henry F. Schneider, one percent to Elmer E. Collette, one percent to Leo V. Sondelbeck, and one percent to Arthur D. Goeddel, all of Waterloo, Ill.; one percent to Anton A. Wierschem and Mamie Wierschem, and one percent to Elmer W. Koch, all of Columbia, Ill., and one percent to Ira A. Moore, of Collinsville, Ill.

Application October 16, 1936, Serial No. 106,004
2 Claims. (Cl. 181—57)

1. A muffler of the class described comprising a drum-like casing provided below its horizontal

center with opposed inlet and outlet ports, respectively, a series of spaced apart similarly curved baffles upstanding from the inlet port, said series being graduated in height, a baffle up-



standing from the bottom of the outlet port, and a baffle depending from the casing intermediate said series of baffles and said outlet port baffle, said outlet port baffle and said intermediate baffles being oppositely curved relative to said series of baffles.

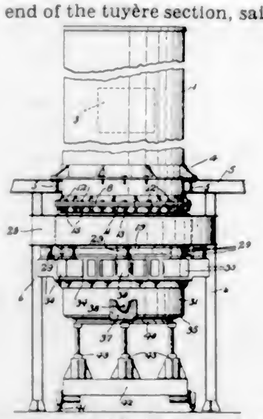
2,101,390

BLOWER FOR VACUUM CLEANERS

Engelbert Gorissen, Wuppertal-Barmen, Germany; Margarete Gorissen, née Becker, Wuppertal-Barmen, Germany, legal representative of Engelbert Gorissen, deceased, assignor to the firm Vorwerk & Co., Wuppertal-Barmen, Germany

Application February 20, 1936, Serial No. 64,987
In Germany March 1, 1935
1 Claim. (Cl. 230—127)

A blower for hand vacuum cleaners, comprising a casing, a substantially conical blade-carrying disc rotatably mounted in the casing, blades secured to the said disc to form a fan, and an air outlet connection branching off from the casing at an angle to the plane of rotation of the fan, the upper boundary of the inclined air outlet connection lying approximately in a continuation of the conical surface of which the blade-carrying disc forms a part.



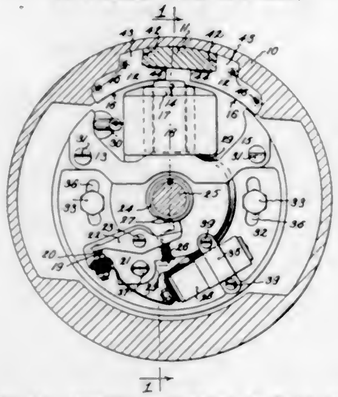
2,101,391

FOUNDRY CUPOLA

Laurence A. Grotewohl, Muskegon, Mich., assignor to Campbell, Wyant & Cannon Foundry Company, Muskegon Heights, Mich., a corporation of Michigan

Application February 3, 1936, Serial No. 62,066
4 Claims. (Cl. 266—25)

1. In a cupola furnace, a vertically disposed charging section, a plurality of vertical posts, means connecting the upper ends of said posts and the charging section for supporting said section by the posts, melting, tuyère and well sections of the furnace located in vertical alinement below the charging section, a second means for detachably connecting the melting section at the lower end of the charging section, a third means for detachably connecting the tuyère section at the lower end of the melting section, and a fourth means for detachably connecting the well section at the lower end of the tuyère section, said second,



third and fourth means being individually operatable for the purpose described.

2,101,392

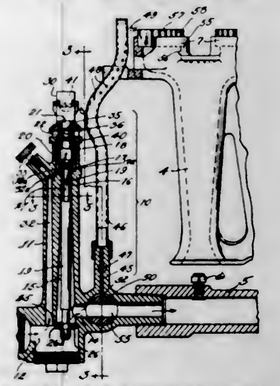
ELECTRIC GENERATOR

Kenneth A. Harmon, Longmeadow, Mass., assignor to Wico Electric Company, West Springfield, Mass., a corporation of Massachusetts

Application November 19, 1936, Serial No. 111,576
13 Claims. (Cl. 171—209)

1. In an electric generator, a field structure including a permanent magnet and a pair of pole shoes, a core structure, a generating coil carried by the core structure, means for rotating one of said structures relatively to the other, said shoes each having a curved portion for cooperation with the core structure on relative rotation of said structures and a seat for one polar end of the magnet, said shoes being circularly spaced relatively to the axis of said rotation, said seats located in adjacent relation and spaced apart circularly relative to said axis by a distance greater than that by which the adjacent ends of said curved portions are spaced apart, said magnet extending between said seats and having its polar ends engaged one with each of said seats.

2,101,393



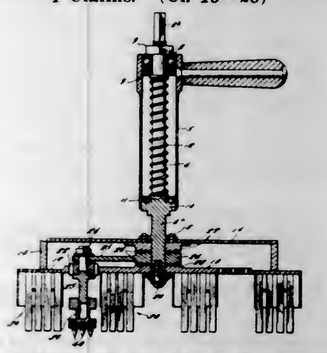
GAS BURNING AND CONTROL APPARATUS

George Herbster, Cleveland, Ohio

Application October 24, 1933, Serial No. 694,962
5 Claims. (Cl. 158—117.1)

4. In a pilot burner device, a valve body having

a seat, a valve plug cooperable with the seat for controlling the admission of fuel to sustain a pilot flame, a thermostatic lever in heating relation to the pilot flame and operatively connected at one end to the valve plug and at the other end to the body, said lever being bowed adjacent the flame intermediate its ends, and arranged so that upon heating of the lever, the ends thereof move relatively toward each other and thereby move the valve plug and seat relatively toward each other for reducing the admission of fuel to the pilot flame, and upon cooling of the lever, the ends thereof move relatively away from each other and



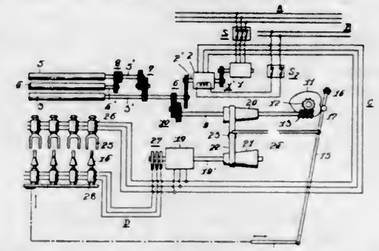
thereby move the valve plug and seat relatively away from each other for increasing the admission of fuel to the pilot flame, and means operable to maintain the end of said lever connected to the plug in a path of travel spaced a greater distance outwardly from the flame than the end of the lever connected to the body during said relative movements, whereby upon movement of said ends of the lever toward each other for reducing the admission of fuel to the pilot flame, the intermediate portion of the lever is swung outwardly about the body end of the lever away from the flame.

2,101,394

MEAT BLOCK BRUSH

Franklin D. Johnson, Charleston, W. Va.

Application July 14, 1936, Serial No. 90,593
4 Claims. (Cl. 15—28)



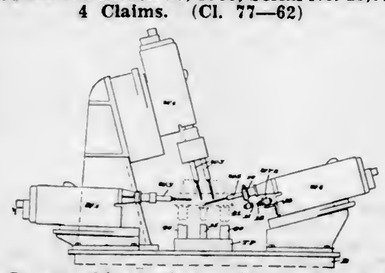
1. In a device of the character described, a shaft, an annular plate secured to the shaft and having an inner circular edge provided with gear teeth, a second annular plate arranged within the confines of the first annular plate and mounted on the shaft to rotate about the shaft as an axis, said second annular plate having a peripheral edge provided with gear teeth, a spider member loose on the shaft and having arms provided with means engageable with the surface being worked upon for holding the spider member stationary, pinions mounted on the free ends of said arms and meshing with the teeth on the respective plates to impart differential rotary movement to the said plates, and each of said plates having a plurality of bristles depending from one side thereof.

2,101,395

OPERATING APPARATUS FOR FLYER FRAMES

Etsuro Kato, Hara-Machi, Meguro-Ku, Tokyo-Shi, Japan

Application January 5, 1937, Serial No. 119,143
In Japan June 20, 1936
3 Claims. (Cl. 118—43)

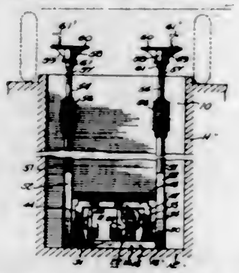


1. An operating apparatus for a flyer frame comprising, two mutually associated generators, motors for driving the flyers and motors for rotating movable bobbins, one of said generators providing a supply source for the motors for driving the flyers and the other of said generators providing a current supply for the motors driving the bobbins, draft apparatus driven in association with said generators, and means for varying the speed of the draft apparatus relative to the speed of the bobbins in accordance with the winding movement of the bobbins.

2,101,396

AUTOMATIC MACHINE TOOL WITH WORK CLAMPS

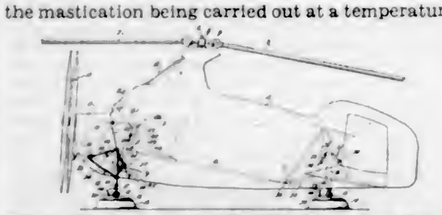
Edward Joslin Kingsbury, Keene, N. H.



Application March 29, 1935, Serial No. 13,740
4 Claims. (Cl. 77—62)

1. In a machine tool, a working unit including a tool and means for feeding the same and detaining means operative for normally holding the tool in withdrawn position, a work holder including means for locating the work relative to the working unit and a power device for presenting the work to and holding it at the locating means;

a source of energy, means selectively operable for delivering energy from said source alternately to the power device and to the detaining means for effecting the release of the latter, power-actuated means actuated from said selectively operable means for controlling the delivery of energy from the selectively operable means to the power device for causing the latter to become energized selectively for effecting the presenting of the work at the locating means and its clamping thereat and for effecting release of the work, a first supervising control element normally occupying an obstructing position to prevent flow of energy from said selectively operable means to said detaining means and thereby effective to prevent release of said detaining means when the selectively operable means is in position for delivering energy toward the detaining means, said first control element being actuated upon movement of the work into presented position for permitting the flow of energy to said detaining means for the release of the same, and a second supervising control element normally occupying an obstructing position to prevent the flow of energy between the power-actuated means and said selectively operable means whereby to prevent movement of said power-actuated means and constructed and arranged to be moved to another position by the tool unit when said tool enters withdrawn position whereby to permit reversal of the power-actuated means and a release of the work.

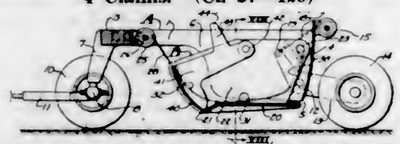


2,101,397
VEHICLE ROCKING APPARATUS
Philip J. Kroll, New York, N. Y.
Application November 27, 1934, Serial No. 755,038
8 Claims. (Cl. 73—51)

8. Apparatus of the character described comprising a pair of upwardly extending posts having means at their upper ends engageable beneath the frame of a motor vehicle, a pair of bell crank levers pivotally supported intermediate their ends on spaced parallel axes and each having one end connected to one of said posts, said ends of said bell crank levers extending away from each other, and motion transmitting means, including a motor, connected to the other ends of said bell crank levers to rock them on their axes.

2,101,398
SHELLAC SUBSTITUTE AND PROCESS OF PRODUCING THE SAME
Wilhelm Krumbhaar, Detroit, Mich.
No Drawing. Application April 9, 1936, Serial No. 73,591
7 Claims. (Cl. 134—26)

7. A low viscosity solution adapted for use in varnishes, enamels, paints or the like, or for impregnating, adhesive stiffening or water-proofing compositions, comprising a masticated copal gum, substantially completely dissolved in ethyl alcohol, the mastication being carried out at a temperature

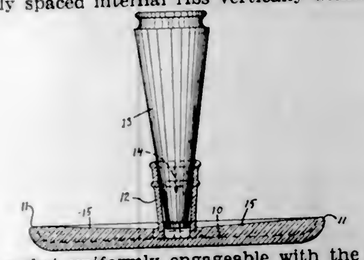


within the range of 90°–120° F. and under a pressure of from 50–150 pounds per square inch.

2,101,399
AIRCRAFT OF THE ROTATIVE-WING TYPE
Agnew E. Larsen, Kingston-on-Thames, England, assignor to Autogiro Company of America, Willow Grove, Pa., a corporation of Delaware
Application January 12, 1937, Serial No. 120,155
14 Claims. (Cl. 244—100)

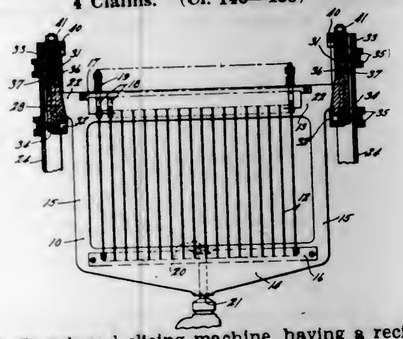
1. An aircraft including a sustaining rotor providing for substantially vertical descent, and landing gear having vacuum cup means adapted to cooperate with the landing surface upon contact therewith to restrict substantial movement of the craft on said surface.

2,101,400
EARTH MOVING MACHINE
Frank P. Lawler, San Francisco, Calif., assignor to Charles H. Grant, San Francisco, Calif., Paul J. Tyler, Oroville, Calif., and himself
Application January 4, 1937, Serial No. 118,946
4 Claims. (Cl. 37—128)



1. In an earth moving machine of the character described, a main frame, front wheels supporting the front end of the frame, an adjustable frame pivotally attached to the main frame adjacent the rear end thereof, rear wheels journaled at the rear end of the adjustable frame and supporting said frame, means connected with the adjustable frame for swinging said frame about the axis of the rear wheels to raise or lower the rear end of the main frame, a bucket carried by the main frame, said bucket comprising a bottom section and a pair of side sections, a scraper blade attached to the front end of the bottom section and extending crosswise thereof, a pivotal support between the rear upper ends of the sides of the bucket and the main frame, means for swinging the bucket about the pivotal support, a plate secured to the main frame rearwardly of the bucket and forming a rear gate for the bucket, a spreader blade carried by said plate, and a front gate pivotally attached to the bucket.

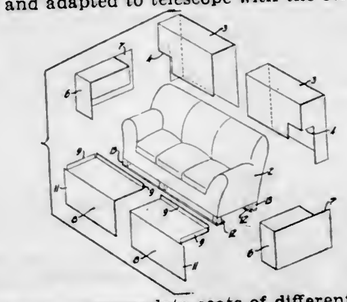
2,101,401
SERVING DEVICE
Louis A. Leppke, Omaha, Nebr.
Application February 4, 1936, Serial No. 62,283
1 Claim. (Cl. 65—15)



The hereindescribed serving device comprising a plate having a central integrally formed supporting member upstanding therefrom a distance substantially greater than the thickness of the plate, and having a tapering upwardly opening socket, said plate having integral ribs radiating from said member and reenforcing the latter, and a relatively tall, rigid beverage container

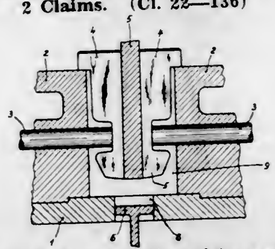
having a tapering lower end for extension into the said tapering socket in a manner to prevent overturning of the container, said holder having annularly spaced internal ribs vertically within its

said socket uniformly engageable with the container to form a slip grip with the latter and at the same time prevent sticking of the container in the socket of the supporting member.



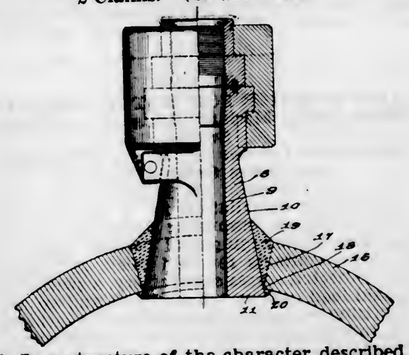
2,101,402
GUIDE MOUNTING FOR BREAD SLICING KNIFE FRAMES
Norman W. Lyon, Springfield, Mass., assignor to National Bread Wrapping Machine Co., Springfield, Mass., a corporation of Massachusetts
Application April 1, 1936, Serial No. 72,118
4 Claims. (Cl. 146—153)

1. In a bread slicing machine, having a reciprocable knife frame and fixed supporting frames disposed one adjacent each of two opposite sides of the knife frame, sub-frames mounted one in each of the fixed supporting frames and having means for guiding said knife frame in its reciprocating movement, interengageable means provided on each fixed frame and its adjacent sub-frame for slidably supporting the sub-frames on the fixed frames for limited movement toward and away from each other in a plane normal to that of the movement of the knife frame, and yieldable means for moving the sub-frames toward each other.



2,101,403
CARTON FOR AND METHOD OF PACKAGING FURNITURE
Archibald V. MacDonald, Los Angeles, Raymond A. Minkler, Hawthorne, and Herbert Iske, Alhambra, Calif.
Application June 12, 1935, Serial No. 26,192
5 Claims. (Cl. 45—22)

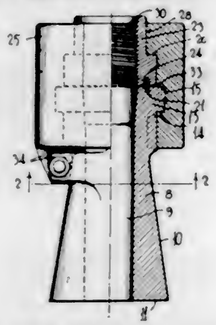
1. A carton for a piece of furniture having a seat, back and arms, comprising a section shaped to fit over one portion of the back, a section shaped to fit over another portion of the back and adapted to telescope with the other section to accommodate backs of different length, a section shaped to fit over a portion of the seat, a section shaped to fit over another portion of the seat and adapted to telescope with the other seat



section to accommodate seats of different length, and sections shaped to fit over said arms.

2,101,404
CHILL MOLD
Ernst Mahle, Stuttgart, Germany
Application August 18, 1936, Serial No. 96,663
In Germany October 19, 1935
2 Claims. (Cl. 22—136)

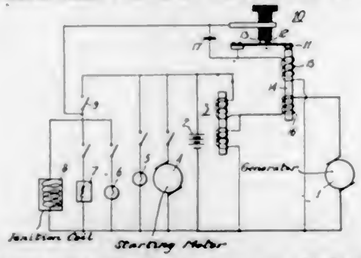
1. A chill mold for casting pistons which consist of a plurality of metal alloys comprising a side wall and a bottom wall, a member movably mounted with respect to said mold and having a shape similar to that of the space which the first alloy is intended to occupy in the piston to be cast, and said movable member being arranged in the bottom of said mold.



2,101,405
COUPLING
Roy S. McKeever, Tulsa, Okla., assignor to Smith Separator Corporation, Tulsa, Okla., a corporation of Oklahoma
Application January 12, 1937, Serial No. 120,303
2 Claims. (Cl. 285—106)

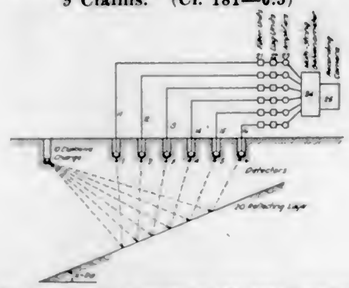
1. In a structure of the character described, a metallic wall having a port therein, a metallic

nozzle having a thickened base portion, said base portion having an external flared surface extending through said port and abutting against the wall surrounding said port, one end of the base portion being of larger diameter than the port to prevent the nozzle from passing therethrough, and welding metal securing the nozzle to the wall of said port.



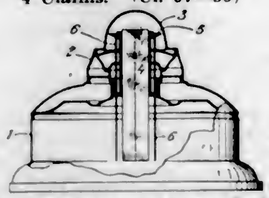
2,101,406
PIPE COUPLING
Roy S. McKeever, Tulsa, Okla., assignor to Smith Separator Corporation, Tulsa, Okla., a corporation of Oklahoma
Original application January 12, 1937, Serial No. 120,303. Divided and this application April 15, 1937, Serial No. 137,152
1 Claim. (Cl. 285—177)

Means for quick detachably connecting a pipe to a high pressure tank comprising a nozzle adapted to be secured to said tank and having an end groove and spaced peripheral lugs, the inner ends of the lugs being inclined and forming cam surfaces, a nipple adapted to be secured to said pipe and having an external annular shoulder and an end groove, an annular gasket seated in said grooves, a collar surrounding the nozzle and nipple and having an internal annular shoulder near one end thereof impinging against the shoulder of the nipple, internal lugs at the opposite end portion of the collar provided with inclined inner ends forming cam surfaces engaging the cam surfaces of the lugs of the nozzle for moving the nipple toward the nozzle and tightening the gasket when the collar is turned in one direction relatively to the nozzle, overlapping apertured ears projecting respectively from the collar and nozzle, and a bolt extending through said apertures for use in drawing the ears toward one another.



2,101,407
ALARM DEVICE FOR MOTOR VEHICLES
Johan Birger Moriand, Langed, Nordmaling, Sweden
Application October 7, 1935, Serial No. 43,967
In Sweden October 30, 1934
1 Claim. (Cl. 177—311)

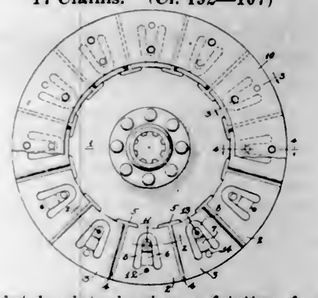
An electric installation for a motor vehicle, said installation comprising a storage battery, a generator for charging said battery and a cut-out relay, contacts for said relay, at least one load connected across said battery, a switch placing said load into or out of circuit and an alarm comprising a control coil connected in series with said battery and said generator and with the contacts of said cut-out relay, a circuit including said battery, said switch and an alarm operating coil, normally closed contacts opened by the energization of either coil and included in said operating coil circuit, the arrangement being such that when said switch is closed, said device is



operative or inoperative according to whether the current in said cut-out relay is less or greater respectively than a predetermined value and that, when said switch is open, said device is inoperative.

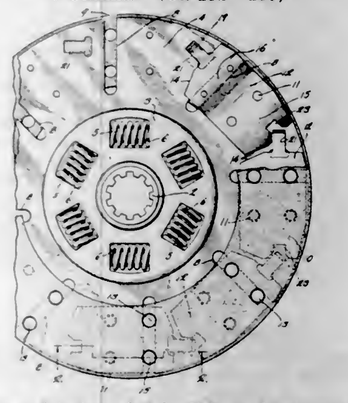
2,101,408
SEISMIC SURVEYING METHOD
David Saville Muzzey, Jr., Houston, Tex., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware
Application November 6, 1935, Serial No. 48,510
9 Claims. (Cl. 181—0.5)

1. In a seismic surveying system comprising a plurality of detectors electrically connected to a plurality of galvanometers, the steps of generating a disturbance in the ground, converting said disturbance into electrical impulses at each of the detectors, transmitting the impulses from all detectors to each of the galvanometers through lines having different electrical time lags for each galvanometer, and simultaneously recording the indications of all galvanometers.



2,101,409
STORM LANTERN
Bruno Nier, Beierfeld in Sachsen, Germany
Application July 14, 1936, Serial No. 90,573
In Germany July 20, 1935
4 Claims. (Cl. 67—53)

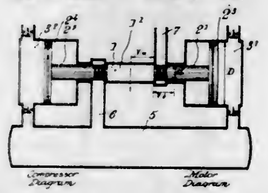
1. A storm lantern comprising, a fuel reservoir, a burner cap supported on said reservoir and



adapted to provide a cover therefor, a wick tube extending from said reservoir into said cap, a flame plate supported at the top of said wick tube, and heat conducting elements attached to said flame plate and extending into said reservoir.

2,101,410
CLUTCH PLATE
Harold Nutt and Harold V. Reed, Chicago, Ill., assignors, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application December 11, 1933, Serial No. 701,888
17 Claims. (Cl. 192—107)

1. A clutch plate having a friction facing on the side thereof, sectors in the peripheral portion of said plate having portions extending away from the plane of the body of the plate in the direction of said facing, tongues in said sectors, and bends in said tongues and in said sectors cooperating to provide a multi-stage cushion on said plate for said facing, said sector portions and said tongues being arranged relative to said facing in a manner such that the facing is supported by the tongues out of engagement with the sectors during the initial stage of cushion action, but contacts the said sector portions during a succeeding stage of cushion action.

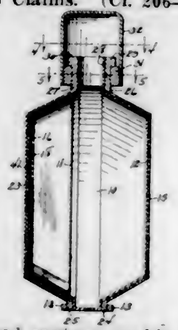


2,101,411
DRIVEN CLUTCH DISK
Harold Nutt and Harold V. Reed, Chicago, Ill., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application November 14, 1935, Serial No. 49,653
7 Claims. (Cl. 192—107)

1. In a friction clutch disk, a driven plate of relatively non-yielding material adapted to be

mounted upon a shaft, an annular friction facing carried by said plate on one side thereof, a similar friction facing disposed upon the opposite side of the plate in normally spaced apart relationship relative thereto, and multi-stage cushion means carried by said plate yieldingly to support said last named facing thereupon, said means comprising a plurality of structurally independent relatively light spring steel members each fixed adjacent one end to the plate and each free at its outer end and having an intermediate bowed portion contacting with and secured to said last named facing, said free ends of said cushion members being adapted, during compression of the disk, to engage with and abut a portion of said plate and first named facing assembly.

2,101,412
FREE PISTON DRIVING GAS GENERATOR
Raul Pateras Pescara, Paris, France
Application June 1, 1936, Serial No. 82,995
In France June 3, 1935
14 Claims. (Cl. 230—56)



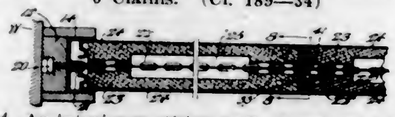
1. In a driving gas generator having motor and compression cylinders and operatively connected motor and compression pistons freely movable in said cylinders, and having means for supplying at least a portion of the gas compressed in said compression cylinder to said motor cylinder to generate therein a driving gas, said generator having a variable power output and delivery pressure, and having means to return said motor piston to compression position, said means including a dead space cushion in said compression cylinder, the energy retained in which acts on the compression piston, and further including means to supply additional energy the amount of which is substantially independent of the delivery pressure and the pressures in the cylinders, the proportion between the scavenging and compressing portions of the motor piston stroke and the ratio of the diameters of the motor and compression cylinders being such that the compression pressure in the motor cylinder lies between a minimum pressure necessary to cause combustion of fuel and a maximum pressure not greater than the mechanical strength of the cylinder.

2,101,413
PROCESS FOR PRODUCING MIXED CELLULOSIC ESTERS
Otto Sindl, Paris, France, and Georg Frank, Moedling, near Vienna, Austria, assignors to "Afag" Finanzierungs A. G., Schaffhausen, Switzerland
No Drawing. Application September 25, 1936, Serial No. 102,630. In France October 18, 1935
5 Claims. (Cl. 260—101)

1. A process for producing mixed cellulose esters containing at least two dissimilar kinds of acyl radicals by introducing into a cellulose ester, which has been produced by an esterification operation carried out in the presence of at least one catalyst containing sulpho-radicals, at least one additional kind of acyl radical differing from the kind already fixed in the ester, said process consisting in removing the esterifying liquid

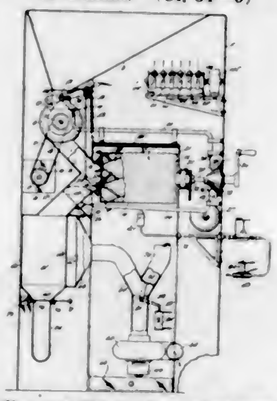
from the cellulose ester, treating the cellulose ester in the non-dissolved state and whilst still containing residues of the esterifying catalyst with a non-hydrolizing liquid at least one component of which is a radical-displacing agent containing at least one radical to be introduced into the ester selected from the group consisting of: fatty acids, esters of fatty acids, and derivatives of both these kinds of compounds, whereby the radical to be introduced enters into the molecule of the ester by a process of radical exchange, and finally removing the residues of the catalyst from the mixed ester formed for the purpose of stabilizing the latter.

2,101,414
COMBINED CANTEEN, COOKING, AND MESS KIT
William H. N. Stevens, Columbus, Ohio
Application March 29, 1937, Serial No. 133,718
5 Claims. (Cl. 206—4)



1. A combined canteen, cooking and mess kit, comprising a canteen having a neck, laterally extending apertured projections on the bottom of the canteen, a frying pan arranged on one side of the canteen, a cooking pan arranged on the other side of the canteen, lugs on the bottom of both pans engageable in said apertured projections, extensions on the top of both pans adapted to lie along said neck of the canteen, and a coupling ring adapted to embrace said neck and the last named extensions for holding the parts assembled.

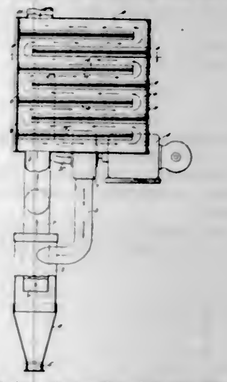
2,101,415
SEALING DEVICE
Cameron A. Stuart, Hettinger, N. Dak.
Application July 22, 1935, Serial No. 32,612
1 Claim. (Cl. 15—133)



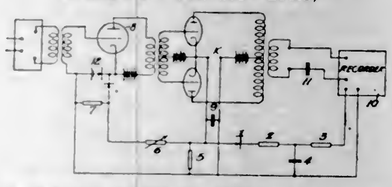
A sealing device for a container having open opposite ends, and a dispensing means in one end of the container, comprising interior threads carried by the opposite end of the container, and a plug threaded into said opposite end of the container, said plug including a knurled flange having a diameter greater than the diameter of the plug, and a cylindrical cover supporting shoulder integral with the plug and disposed between the flange and the outer end of the plug, said shoulder having a diameter less than the flange and greater than the diameter of the adjacent end of the container.

2,101,416
WALL CONSTRUCTION
Frederick M. Venzie, Philadelphia, Pa., assignor to National Gypsum Company, Buffalo, N. Y., a corporation of Delaware
Application September 15, 1933, Serial No. 689,579
6 Claims. (Cl. 189—34)

4. An interior partition wall comprising a multiplicity of surfacing units, supporting means, chains secured at one end to said supporting means and passing through said surfacing units, and a wedge passing through a link in each of said chains and abutting an edge of one of said units for maintaining said chain under tension and said units in abutting relationship.



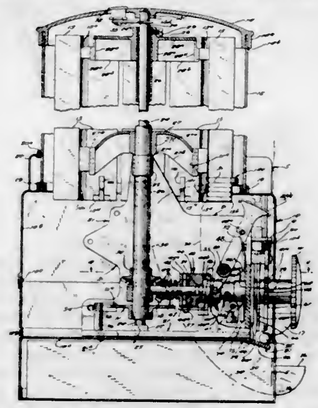
2,101,417
ROASTING APPARATUS
Albert C. Waldvogel, Richmond Heights, Mo.
Application April 18, 1934, Serial No. 721,093
21 Claims. (Cl. 34—5)



3. A coffee roasting apparatus comprising a rotary roasting chamber, a rotary stoner, a first mechanism for rotating said chamber and said stoner in synchronism, a second mechanism movable into different positions, one for directing quantities of coffee into said roasting chamber and one for discharging the coffee therefrom below the entrance to said stoner, suction mechanism for subsequently conveying the coffee to a position above said stoner, means for directing the coffee into said stoner, and for directing the coffee from said stoner, said last named means being connected with said second mechanism to operate simultaneously therewith.

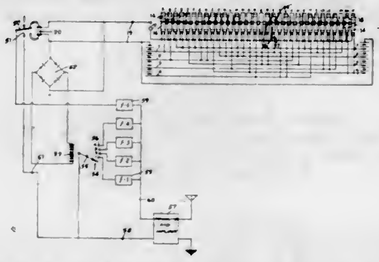
2,101,418
CAFFEINE COLLECTOR
Albert C. Waldvogel, Richmond Heights, Mo.
Application November 8, 1934, Serial No. 752,041
5 Claims. (Cl. 183—94)

1. In a device of the character described, a compartment comprising side, bottom and top walls, end walls, means for holding said end walls detachably connected with said side walls, vertical series of horizontal brackets attached to said side walls, and vertical series of trays supported by said brackets for longitudinal sliding movements for removal and replacement and forming a tortuous passage from the lower end to the upper end of said compartment.



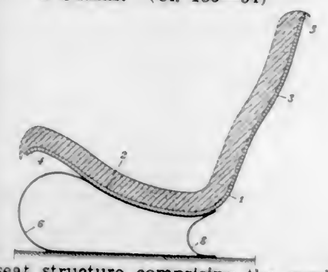
2,101,419
RECORDING OF ELECTRICAL IMPULSES
Heinrich Weber, Berlin, Germany, assignor to Klangfilm G. m. b. H., Berlin, Germany, a corporation of Germany
Application July 25, 1936, Serial No. 92,562
In Germany September 9, 1935
5 Claims. (Cl. 179—100.3)

2. A signal responsive apparatus including a pair of amplifiers connected in push-pull relation, means common to the grid circuits of said amplifiers for producing a control potential which varies in response to the signal to be amplified, a pair of leads associated with the output circuit of said push-pull amplifiers for delivering the amplified signal, a pair of leads common to the anode circuits of said amplifiers for producing a potential which varies as the envelope of said signal, means associated with said common leads for controlling the input potential of said amplifiers only when said envelope potential exceeds a predetermined value, a signal recorder, and means interposed between said common leads and said recorder for applying to said recorder a noise reduction bias potential which varies in accordance with said envelope potential.



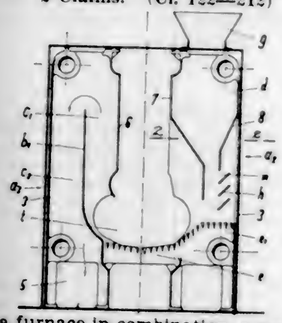
2,101,420
VENDING MACHINE CONSTRUCTION
Gilbert J. Scofield, Loudonville, N. Y.
Application December 8, 1934, Serial No. 756,663
11 Claims. (Cl. 312—65)

1. The combination with a vending machine in which a movable container includes a plurality of compartments capable of holding different kinds of articles, each compartment being capable of holding a plurality of superimposed articles; of an operating apparatus including compartment selecting mechanism, delivery effecting mechanism, and means operable in one direction to actuate said selecting mechanism to make



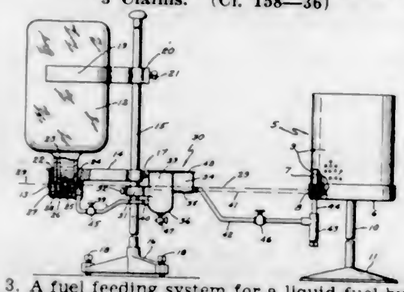
an optional choice of any one of said compartments and place the chosen compartment in delivery position, said means being operable in the opposite direction to effect positive delivery of one article from the chosen compartment by displacing the article therefrom.

2,101,421
COMMUNICATION SYSTEM
Alfred L. Sprecker, Freeport, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application January 23, 1935, Serial No. 3,001
10 Claims. (Cl. 178—66)



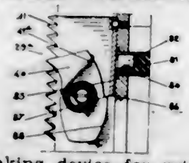
1. In a communication system, means to initiate character signals consisting of impulses having different current values and polarity, a plurality of sources of different frequencies, means to select certain frequencies from the said plurality in accordance with the current values of the initiated signals to modulate a carrier wave accordingly, means adapted to control the selection of one of said frequencies in addition to other selected frequencies to represent a definite polarity, means to transmit and receive the modulated carrier wave, means associated with the receiving means to transform the carrier wave modulated by the selected frequencies into character signals including means responsive to the additional selected frequency to determine the polarity of the transformed character signals so as to correspond to the initiated character signals.

2,101,422
FLEXIBLE SEAT SUPPORT
Louis Assalit, Marseille, France
Application January 31, 1935, Serial No. 4,246
In France February 14, 1934
3 Claims. (Cl. 155—54)



1. A seat structure comprising the combination of a rigid seat unit and a damped spring suspension supporting said seat unit and when the seat unit is occupied effectively damping oscillations due to movements of an occupant or vibrations of a vehicle upon which the seat structure may be mounted, said seat unit including a seat portion and a back portion fixedly secured together to form a rigid unalterable unit having inflexible bearing surfaces, and said damped spring suspension including a relatively large forwardly looped or U-shaped spring of flat strip steel having two unequal limbs, with the longer limb resting on the floor and directed rearwardly and the other shorter limb attached directly to the seat portion, and a relatively smaller forwardly looped or U-shaped spring of flat strip steel having the ends thereof secured to the inside portions of the ends of the large spring so as to be located substantially within the outline of said large spring, and both springs together forming a damped spring unit and having relatively unequal and non-harmonic rates of vibration which are effective to mutually dampen each other when the seat structure is occupied within practical limits for varying weights of occupants.

2,101,423
FURNACE
Stefan Beck, Budapest, Hungary
Application June 26, 1935, Serial No. 28,515
In Austria and Czechoslovakia April 20, 1935
2 Claims. (Cl. 122—212)

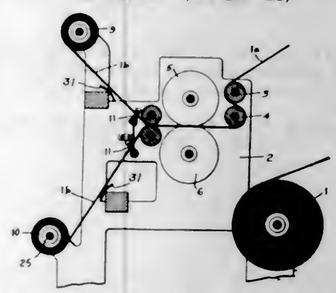


1. In a furnace in combination, a grate, charging ducts for supplying fuel to said grate from above, means for admitting combustion air to the fuel in each charging duct above the incandescent layer of fuel on the grate, means positioned in each charging duct and in the region of the air-admitting means for restricting the free sectional area of each charging duct to not more than 25% of the area of said grate, and cooling chambers inserted between said charging ducts said charging ducts being delimited by the walls of the cooling chambers and by walls branched off the cooling chamber walls and extending between adjoining cooling chambers.

2,101,424
COMBINED FILTER AND PRIMER FOR OIL BURNERS
Melvin C. Bennett, Middletown, Conn., assignor of one-half to Thomas F. Smithwick, Middletown, Conn.
Application August 16, 1935, Serial No. 36,534
3 Claims. (Cl. 158—36)

3. A fuel feeding system for a liquid fuel burner comprising a bottle base providing a constant level supply chamber for an inverted bottle feed and for determining the highest level to which fuel may rise in the burner, a receptacle between the supply chamber and the burner and including a receiving and settling chamber, a conduit connecting the supply chamber to the lower part of the receiving chamber, a manually operable shut off valve in said conduit, a conduit connecting the receptacle with the burner and connected with the receptacle at a point below the high fuel level to determine the low fuel level in the burner, said receptacle having sufficient capacity between said levels to supply a sufficiently large priming charge to the burner for starting it when the shut off valve is closed, a second shut off valve between the receptacle and the burner, an upright standard, and means for mounting the supply chamber and the receptacle for relative vertical adjustment on the standard whereby to adjust said fuel levels.

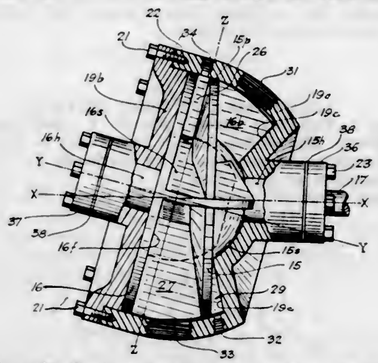
2,101,425
BRAKING DEVICE FOR ROTATING MACHINE PARTS
Louis Charles Brisson, Neuilly-sur-Seine, France, assignor to Société Anonyme Société des Freins Hydrauliques S. de Lavaud, Paris, France
Application February 8, 1936, Serial No. 62,960
In France August 8, 1935
8 Claims. (Cl. 188—79.5)



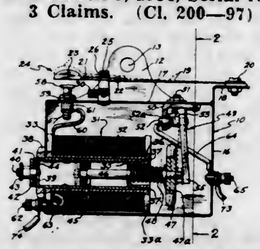
1. In a braking device for rotating machine parts, in combination, a braking surface integral with said machine parts, braking means for exerting pressure on said braking surface, operating means for applying said braking means against said braking surface, automatic slack-adjusting means for taking up excess slack in said braking means, and automatic hit-or-miss means controlled by the temperature of the brake parts which block said automatic slack-adjusting means in such position as to render same fully inoperative as soon as the temperature of the brake parts reaches a pre-established maximum, and fully release said slack-adjusting means when the temperature drops below said maximum.

2,101,426
METHOD OF PRODUCING LOW CARBON HIGH CHROMIUM CAST IRON
Charles O. Burgess, Niagara Falls, N. Y., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
No Drawing. Application March 14, 1935, Serial No. 11,074
6 Claims. (Cl. 75—127)

1. As an article of manufacture for adding chromium to a cupola melting charge, a briquetted metallic mixture comprising a binder and metallic ingredients having the approximate composition range: 40% to 75% chromium; 5% to 15% silicon; 5% to 15% copper; carbon in an amount less than 2%; remainder iron.



2,101,427
TABULATING CARD
Leo C. Conradi and Almon M. Fairbrother, Binghamton, N. Y., assignors to International Business Machines Corp., New York, N. Y., a corporation of New York
Application May 1, 1935, Serial No. 19,180
1 Claim. (Cl. 91—14)



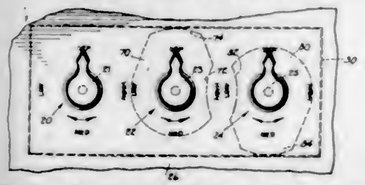
In a paper treating device, means for slitting a strip of paper, means for separating the edges of the paper thus slit, means for applying an impregnating solution simultaneously to the separated edges, said last named means comprising separate wick devices associated with the said edges and connected to a common supply, and means for winding the slit and impregnated portions of paper on separate reels.

2,101,428
ROTARY FLUID DISPLACEMENT DEVICE
Ernest Alexander Cuny, New York, N. Y., assignor to Cunward, Inc., Brooklyn, N. Y., a corporation of New York
Application May 1, 1935, Serial No. 19,191
10 Claims. (Cl. 103—127)

1. In a fluid displacement device, a rotatable element having blades thereon, a casing having a chamber within which the said element is adapted to rotate, the said casing having a conic portion forming a part of said chamber and opposed to and having the same axis as the said rotatable element such that the edges of the said blades are adapted to rotate contiguously thereto, a rotatable conic element having slots through which the said blades are adapted to reciprocate, the said conic element having a separate axis intersecting the first said axis, inlet and outlet ports in the casing between the said conic portion thereof and the said conic element, inlet and outlet ports between the first said element and the said conic element, and means adapted to rotate the said rotatable elements whereby fluid is caused to be drawn in through the said inlet ports and discharged through the said outlet ports.

2,101,429
ELECTRICAL SWITCH
Quido De Felice, Devon, Conn.
Application March 8, 1934, Serial No. 714,625
3 Claims. (Cl. 200—97)

1. In a control device, a casing of electrical conducting material, switch means including a stationary contact insulated from the casing and a movable contact on the casing and normally tending to move into engagement with the stationary contact, a binding post on and insulated from said casing and adapted to be connected with a source of electrical energy, an electro-magnet in said casing, conductors for connecting the coil of said magnet with the binding post and said source of current, a cylinder within the coil of said magnet, a piston in said cylinder, a rod on said piston and extending through one end of the cylinder, means associated with the cylinder permitting free exit of air from the cylinder to permit free movement of the piston inwardly and restricting passage of air into the cylinder to cause retarded movement of the piston in the other direction, an armature on the outer end of said rod, said rod normally holding the movable contact of said switch out of engagement with the stationary



contact thereof, and spring means for holding said rod in normal position and returning it thereto when moved therefrom whereby when a circuit is completed through the coil of said electromagnet the armature will be attracted and move the piston and piston rod to permit the switch to close as the piston is drawn into the cylinder and remain closed until the spring means returns the armature and piston and rod to normal position shifting the movable contact away from the stationary contact thereof.

2,101,430

ELECTRIC CONTROL DEVICE

Max L. Goldbert, New York, N. Y., and Roy T. Watts, Miami Beach, Fla., assignors to Electric Trading Corporation, New York, N. Y., a corporation of New York

Application February 5, 1935, Serial No. 5,012
11 Claims. (Cl. 200—50)

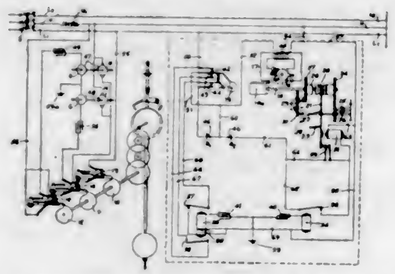
1. In an electric circuit, two adjacent rotary switches, each having an off position, a high position, and one or more intermediate positions, each having a position lock member keyed to its shaft, the edge portion of each of said lock members which is adjacent the other lock member when its switch is in an intermediate position, being an arc centered at the switch shaft, the radii of these arcs for the two lock members totaling substantially the distance between their centers, the portion of each of said lock members which is adjacent the other lock member when its switch is set at high, having edge parts at each side of the line through the shaft centers, which edge parts have a greater radius than the intermediate arc, and the edge portion of each of said lock members which is adjacent the other lock member when its switch is set at off, being concave on the radius of the high position portion of the other switch lock.

2,101,431

DENTURE BLANK

Frazier Groff, Lakewood, Ohio, assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

Original application December 27, 1932, Serial No. 648,848. Divided and this application December 21, 1934, Serial No. 758,693
9 Claims. (Cl. 32—2)



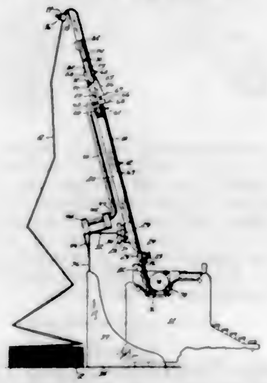
1. Denture blank formed of a compressed thermoplastic moldable artificial resin composition in the approximate shape of a denture provided with gum portions to receive the teeth which contain a depth and thickness of said composition substantially twice that which is to remain therein in the finished denture and having substantial additional thickness of said composition in other portions of said blanks which are adapted to receive molding pressure, whereby maximum flow of said composition in molding is obtained.

2,101,432

TIME SYSTEM

Laurence S. Harrison, Binghamton, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application April 19, 1935, Serial No. 17,245
6 Claims. (Cl. 58—24)



4. A synchronous motor driven clock normally operated from a power distributing system carrying a low frequency current for commercial power uses, means for supplying high frequency currents of different frequency characteristics to said power distribution system, synchronizing means in said clock including means controlled by a high frequency current of one frequency characteristic to accelerate the drive of the clock from the driving motor, means for stopping the synchronous motor drive of said clock when it reaches a certain chronological condition, and means controlled by a high frequency current of another frequency characteristic for resuming normal operation of said clock by the low frequency power current.

2,101,433

APPARATUS FOR GUIDING PAPER FORMS

Philip A. Jackson, Dayton, Ohio, assignor to William C. Lamprechter, Cleveland Heights, Ohio, trustee

Application April 25, 1936, Serial No. 76,379
6 Claims. (Cl. 197—126)

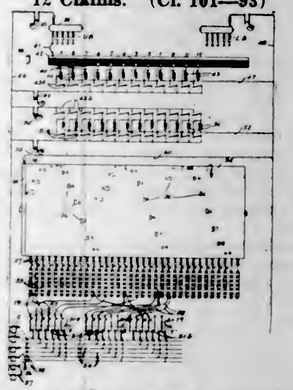
1. An attachment for a writing machine comprising in combination, a standard, a guide bar carried thereby, a table, rollers journalled in the table and engaging the guide bar and an oscillatable bar also mounted on the standard and engaging the table.

2,101,434

VISE

Howard Milton Johnston, Toronto, Ontario, Canada, assignor to Massey-Harris Company, Limited, Toronto, Ontario, Canada

Application December 19, 1936, Serial No. 116,833
3 Claims. (Cl. 29—89)



1. Device for shearing rivets in a pair of riveted members comprising a base having a transverse slot in its top face shaped to receive and hold one of said members whereby the other member rests flat upon the top face of said base, an element slidable on the top face of said base and having an overhanging lip adapted to engage the edge portion of said other member, and means for preventing tilting movement of said first-mentioned member during the rivet-shearing operation comprising adjustable strips carried by said slidable element and depending on either side of said base, said strips having flanges adapted to extend under said first-mentioned member and closely adjacent thereto.

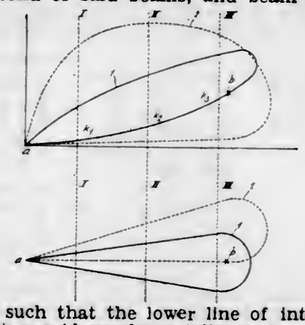
2,101,435

RECORD CONTROLLED PRINTING MECHANISM

William Lang, New York, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application December 28, 1934, Serial No. 759,488
12 Claims. (Cl. 101—93)

1. A printing mechanism for completely printing a word under control of a single perforation in a record card, including means for sensing a perforation, individual type carriers for the different letters of the word and means controlled by said sensing means for effecting printing selection of the different letters of the word at different times during a cycle of operation of the mechanism.



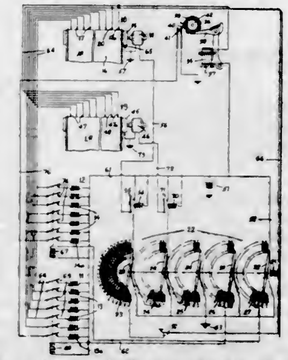
2,101,436

DIRECTIVE SIGNALING

August Leib, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application July 26, 1934, Serial No. 737,010
In Germany July 26, 1933
4 Claims. (Cl. 250—11)

3. In a device for directing an airplane to a blind landing, means for producing two directional beams of modulated wave energy, one of said beams having a lateral wall of its envelope of uniform field intensity which approximately bisects the uniform field intensity envelope of the second of said beams, and beam focussing



means such that the lower line of intersection of the two said envelopes follows a curved path approaching the earth at a diminishing rate and is substantially tangent thereto at the point at which it is desired to land.

2,101,437

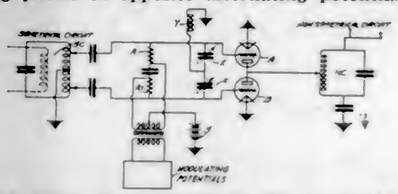
SYSTEM OF OPERATION OF TYPEWRITERS

Walter S. Lemmon, New York, N. Y., Clyde J. Fitch, Jersey City, N. J., and Richard F. Walz, New York, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application November 16, 1934, Serial No. 753,254
4 Claims. (Cl. 197—20)

1. In a system of the class described, a plurality of typewriters, a plurality of perforated record control sheets, individual sensing means cooperating therewith, typewriter selecting means, a rotary control switch comprising banks of individual contacts and associated brushes adapted to cooperate with the corresponding contacts, said typewriter selecting means associated with certain of said contacts, and means under control of one of the said sensing means and control sheets to position said brushes to select certain of said typewriters in accordance with the sensed perforations.

2,101,438



NEUTRALIZED COUPLING CIRCUIT

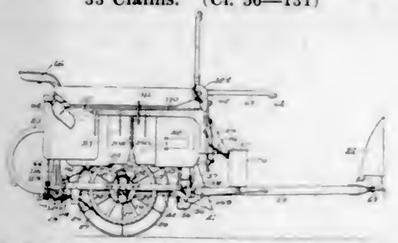
Nils E. Lindenblad, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application February 27, 1935, Serial No. 8,447
20 Claims. (Cl. 179—171)

1. In a relaying system, a symmetrical circuit arranged to be energized by alternating poten-

tials to be relayed, a non-symmetrical circuit, a pair of electron discharge tubes each having an anode, a cathode and a control grid, a circuit connecting the anodes of said tubes together and to said non-symmetrical circuit, leads connecting points of opposite alternating potential on

said symmetrical circuit to like electrodes in said tubes, and reactances tuned to the frequency of the wave to be relayed connecting like electrodes in said tubes to ground to prevent energy in said non-symmetrical circuit from reacting through said tubes on said symmetrical circuit.



2,101,439

GRAIN BINDER

Alexus C. Lindgren, Chicago, and Clemma R. Raney, Riverside, Ill., assignors to International Harvester Company, a corporation of New Jersey

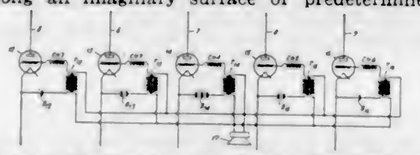
Application November 14, 1935, Serial No. 49,780

33 Claims. (Cl. 56—131)

1. A grain binder having a main frame, a platform carried thereby including a conveyer, a sickle carried by the platform, an elevator carried at one end of the platform including conveyers receiving cut grain from the platform conveyer, a main power shaft carried on the frame, means for driving said shaft, a gear box carried on the frame enclosing gearing driven from said power shaft, and three separate shafts journaled respectively at one end in said box and driven by said gearing, one of said separate shafts extending transversely of the line of draft and connected to drive the platform conveyer, another shaft extending horizontally and longitudinally to drive the sickle, and the last shaft being inclined longitudinally upwardly to drive the elevator conveyers.

2,101,440

SHORT WAVE RADIO TRANSMITTING APPARATUS



Alfred Aubyn Linsell, London, England, assignor to Radio Corporation of America, a corporation of Delaware

Application April 9, 1935, Serial No. 15,384

In Great Britain April 28, 1934

6 Claims. (Cl. 250—17)

1. A very short wave radio transmitting apparatus comprising means for generating and projecting a polarized beam of very short wave radiation in a predetermined direction, a conductor system comprising a plurality of energy absorbing conductors extending across the path of said beam, said conductors being arranged side by side along an imaginary surface of predetermined

shape and being so arranged as to alter the beam passing said conductor system, and means for differently varying the effective impedance of several of said conductors in accordance with desired modulating currents.

2,101,441

RHEOSTAT OR POTENTIOMETER

Jesse Marsten, Philadelphia, Pa., assignor to International Resistance Company, Philadelphia, Pa., a corporation of Delaware

Application January 12, 1934, Serial No. 706,343

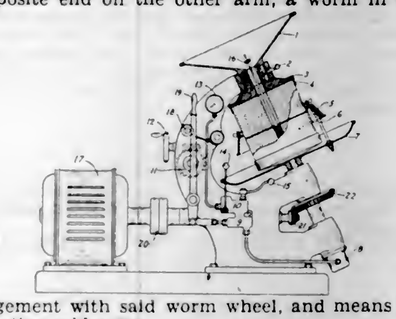
27 Claims. (Cl. 201—55)

1. In apparatus of the class described, an insulating base, a bushing in said base, a shaft mounted in said bushing, a disc of insulating material mounted on said shaft, a metallic disc mounted on said insulating disc, a plurality of fingers integral with said metal disc, a horseshoe shaped piece of resistance material mounted on said base contacted by said plurality of fingers, a terminal and lead connected near one end of the horseshoe to said resistance material, and a lead connected at an intermediate portion of the horseshoe and comprising a metallic plate under said resistance material having ears extending therefrom and in contact with marginal edge portions of said resistance material, whereby a smooth unbroken path is provided for the contacting ends of the plurality of fingers despite the connection of the lead at an intermediate portion of the horseshoe.

2,101,442

CENTRIFUGAL GRINDING MACHINE

Agustin Martinez B., Mexico, D. F., Mexico



Application August 8, 1935, Serial No. 35,284

In Mexico October 26, 1934

5 Claims. (Cl. 83—7)

1. A centrifugal grinding machine of the friction disk type, comprising two articulated arms disposed in the same vertical plane and each carrying a grinding disk, the upper disk being fixed and the lower one rotary, said disks being disposed in parallel longitudinal alinement in a plane inclined to the vertical and normally having their abutting faces in contact over their entire area, and means for raising one of said arms thereby to separate the disks, said means comprising a worm wheel mounted for rotation on one of said arms, a link eccentrically pivoted at

one end on said worm wheel and pivoted at its opposite end on the other arm, a worm in en-

gagement with said worm wheel, and means for rotating said worm.

2,101,443

AIR BRAKE FOR AEROPLANES

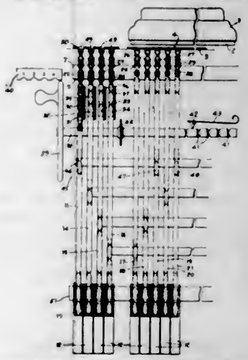
Willy Meinert, Brooklyn, N. Y.

Application March 23, 1937, Serial No. 132,459

1 Claim. (Cl. 244—113)

An aeroplane brake comprising upper, lower and intermediate plates having studs at their rear end edges, guide ways for said studs, said guide ways being disposed at divergent angles whereby said plates are caused to impinge against the air when extended, other guide ways for the return of said studs, gates controlling the path of said studs, and means accessible to an operator to advance or retract said plates.

2,101,444



TICKET PRINTING MACHINE

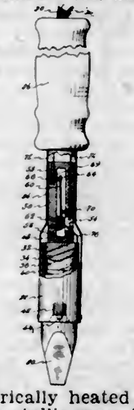
Joseph William Miles, London, England, assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application July 25, 1934, Serial No. 736,809

In Great Britain August 4, 1933

2 Claims. (Cl. 101—111)

1. A coupon ticket printing machine comprising a plurality of looped indicator bands, each indicator band having a series of visible indications thereon settable to a reading line, a plurality of groups of type carrying bands, each type carrying band of a group carrying type corresponding to the indications of a related indicator band, means for selectively operating an indicator band, means for communicating the movement of said indicator band to one type carrying band of a related group to bring the type thereof in a printing line corresponding to the reading line of the indications on the indicator band, and means for communicating the movement of the selected indicator band to the other type carrying band of the group to present the type thereof to another printing line.



2,101,445

AUTOMATIC CONSTANT HEAT ELECTRIC SOLDERING IRON

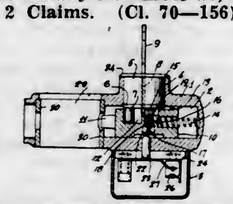
Edmund B. Moore, Brooklyn, N. Y.

Application June 21, 1934, Serial No. 731,634

6 Claims. (Cl. 219—26)

4. In an electrically heated hand tool, a hollow housing, a metallic mass having an electric heating element within and toward an end of said housing, a work tip attached to the outer end of said mass, in intimate thermal contact therewith and extending from said housing, and a bi-metal thermostatic switch in circuit with said electric heating element attached to and extending without said mass, but disposed within said housing, said thermostat having a thermal relationship with said mass substantially equivalent to the thermal relationship of said work tip with said mass.

2,101,446



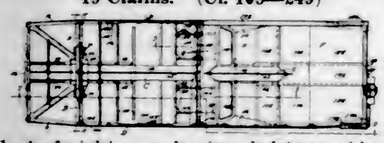
SAFETY LOCKING DEVICE

Abram Nelman, Cologne-on-the-Rhine, Germany

Application September 8, 1936, Serial No. 99,901

In Germany November 29, 1934

2 Claims. (Cl. 70—156)



1. In a key-operated lock, a spring-projectible bolt, key-operated means for partially projecting said bolt, said key projecting into the path of said bolt, and means carried by said bolt whereby, in cooperation with said key, said bolt is prevented from travelling to the fully projected position and whereby upon removal of said key from said lock the bolt will be automatically fully projected.

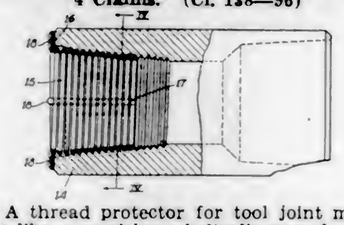
2,101,447
THERMOSTATIC SPEED CONTROL
Samuel R. Oldham, Elizabeth, N. J., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application February 28, 1934, Serial No. 713,248
17 Claims. (Cl. 200—80)

1. In a speed governor for a motor, a fixed contact, a movable contact, and a rotatable member adapted for controlling an electric power circuit, means movable longitudinally of the rotatable member for moving the movable contact for breaking the circuit in response to changes in the rotational speed of the said member, and means for selectively regulating the speed of the rotatable member at which the last-named means becomes operative, the said regulating means comprising a thermomotive member adapted to assume various curvatures in accordance with variations in heat imparted thereto, and a heating member associated with the latter and disposed in an electric heating circuit.

2,101,448
HOPPER CAR
Allen E. Ostrander, Larchmont, N. Y., Robert W. Joy, Berwick, Pa., and Adolph Kassler, New York, N. Y., assignors to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application August 1, 1935, Serial No. 34,200
19 Claims. (Cl. 105—249)

1. A freight car having bolsters, side wall plates formed with integral channel portions adjacent the bolster ends, additional side wall plates overlapping said channel to form box section side stakes, a part of the lower portion of the stake being omitted and a bolster plate secured to said stake and side wall plates, thereby replacing the portion of the channel omitted and completing the box section stake.

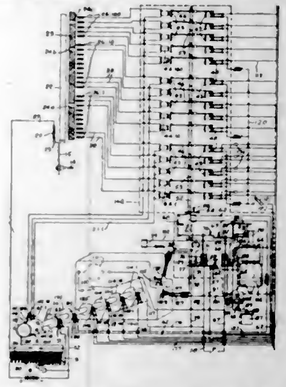
2,101,449
IMPREGNATED ASBESTOS PRODUCT
Robert E. Parry, North Plainfield, N. J., assignor to Johns-Manville Corporation, New York, N. Y., a corporation of New York
No Drawing. **Application September 27, 1935, Serial No. 42,466**
1 Claim. (Cl. 91—68)



An article of manufacture comprising reenforced strands of asbestos fibres woven into a cloth and a fireproof coloring composition coating the exterior surfaces of the fibres, penetrating interstices within the individual fibres and closing the mesh spaces between the several strands, the said composition including a base medium selected from the group consisting of a vinyl resin and a chlorinated rubber, each of high chlorine content, a plasticizer for the base medium and a pigmentary substance distributed substantially uniformly throughout the said medium, the proportion of the pigmentary substance being of the order of 30 to 40 parts by weight to 8 to 15 parts of the said medium, and the coloring composition being in the condition of having been deposited in situ from a mixture of pasty consistency.

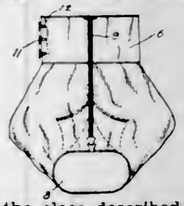
2,101,450
DISPLAY DEVICE
Morris D. Pollinger and Harry J. Watson, Los Angeles County, Calif.; said Watson assignor to said Pollinger
Application February 25, 1935, Serial No. 7,988
4 Claims. (Cl. 211—37)

1. A shoe display support comprising, a crosspiece, a pair of legs carrying said crosspiece and secured to the respective ends of the latter, and a tongue depending from said crosspiece centrally intermediate of said pair of legs and adapted for engaging the counter-portion of a shoe.



2,101,451
THREAD PROTECTOR
Edward J. Protin, Charlerol, Pa., assignor to Pittsburgh Steel Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 1, 1936, Serial No. 98,871
4 Claims. (Cl. 138—96)

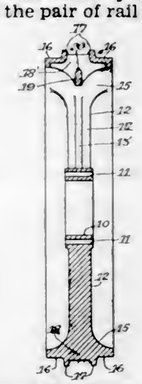
1. A thread protector for tool joint members and a like, comprising a helically wound coil having a plurality of radially superposed turns at one end thereof, the said superposed turns being secured together by the fusing of metal thereto in the form of ribs disposed along radially-extending lines.



2,101,452
RECORDING SCALE
Konrad Rauch, Dayton, Ohio, assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application September 26, 1933, Serial No. 690,985
15 Claims. (Cl. 234—5.4)

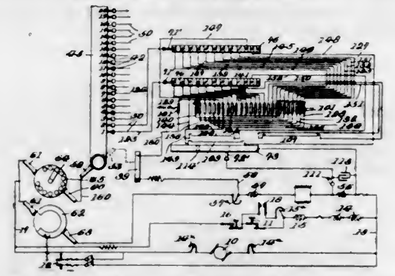
2. In a weighing scale in which load weighing mechanism is provided, the combination of a selectively operable device, means for selectively operating said device in accordance with a load acting on the weighing mechanism, a primary equilibrium control for said means for preventing operation of the latter until the weighing mech-

anism reaches equilibrium, and a secondary equilibrium control for said means for nullifying the selection by said means upon a disturbance of the equilibrium of the weighing mechanism after selection by said means has begun.



2,101,453
DIAPER
Margerie C. Rhodes, New York, N. Y.
Application January 31, 1936, Serial No. 61,742
1 Claim. (Cl. 128—284)

A diaper of the class described, comprising a substantially rectangular blank constituting a body-engaging portion, the ends thereof constituting flaps to form a waistband when assembled, extensions formed on the opposite side longitudinal edges of said body and located between and adjacent to the flaps, said extensions when assembled forming leg openings, and slide fastening elements on the edges of said extensions and flaps to be engaged to hold the body portion, flaps, and extensions in body engaging position.

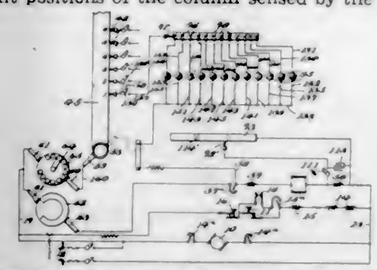


2,101,454
FRONT IDLER WHEEL FOR CRAWLER TRACTORS
Clifford R. Rogers, Oak Park, Ill., assignor to International Harvester Company, a corporation of New Jersey
Application June 14, 1935, Serial No. 26,659
9 Claims. (Cl. 74—230.3)

1. An integrally formed idler wheel having a hub and spokes radiating therefrom, a rim formed on the outer ends of the spokes and comprising a pair of axially spaced rail portions, a rim portion lying radially in the plane of the wheel between the rail portions and carried on the spokes radially inwardly of the rail portions, said rim portion being substantially narrower than the space between the pair of rail portions, said spoke

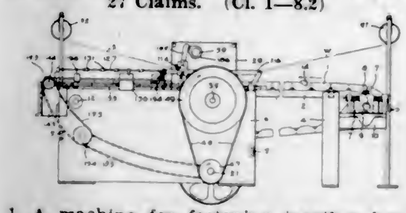
ends being connected between the rail portions by means forming cross webs.

2,101,455
GROUP SELECTOR FOR SORTING MACHINES
Ernest Rose, Washington, D. C., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 20, 1934, Serial No. 758,531
23 Claims. (Cl. 209—110)



1. In a record controlled machine, a machine control element, a circuit therefor; a pair of commutators associated with said circuit, each commutator associated with one of a pair of columns in the controlling records in which pair of columns a classification number comprising one or more digits is recorded; and a unitary control device cooperating with said circuit and said commutators and including a single setting member settable in accordance with a predetermined classification number which may comprise one or more digits and controlling said device to cause the control element to be operated in accordance with both the records having the predetermined classification number and a predetermined number of other classifications according to a predetermined system.

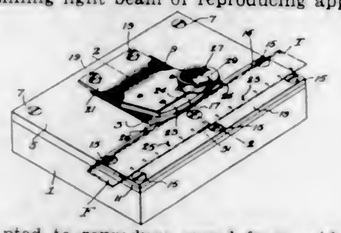
2,101,456
SELECTOR FOR SORTING MACHINES
Ernest Rose, Washington, D. C., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application February 9, 1935, Serial No. 5,804
3 Claims. (Cl. 209—110)



1. In a sorting machine, sorting mechanism including a single magnet for selectively controlling

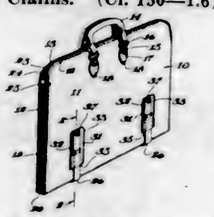
the sorting mechanism, a series of record sensing brushes each sensing the index-point positions of one of the columns of a field in which record identifying designations representing serial numbers or the like are placed; a series of sorting control circuits connecting said brushes to said magnet, each sorting control circuit being connected to a single brush and consisting of a selecting commutator having a series of fixed commutator segments valued according to the respective index-point positions of the column sensed by the par-

ticular brush to which the sorting control circuit is connected, and a series of switches, one switch for each bar, for connecting the bars of each series directly to the sorting magnet; and a keyboard comprising a plurality of banks of manually depressible keys, each bank being associated with the series of switches of one sorting control circuit and operating said switches to open same whereby the sorting magnet is controlled in accordance with numbers and the like set up on said keyboard.



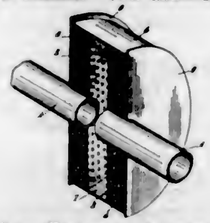
2,101,457
BOX MAKING MACHINE
Alfred L. Rosenmund, Rockaway, N. J., assignor to Stapling Machines Co., a corporation of Delaware
Application August 21, 1935, Serial No. 37,107
27 Claims. (Cl. 1—8.2)

1. A machine for fastening together box or crate parts comprising, in combination, a drive shaft rotatable about a fixed axis, work-feeding means, a carriage reciprocable in the direction of movement of the work, fastener setting mechanism on said carriage, a shaft to operate the fastener setting mechanism, said shaft being rotatably mounted on the carriage substantially parallel to the drive shaft and reciprocable with the carriage, and means to drive the latter shaft from the drive shaft.



2,101,458
TRIMMING DEVICE
Lawrence T. Sachtleben, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application September 28, 1935, Serial No. 42,629
6 Claims. (Cl. 164—50)

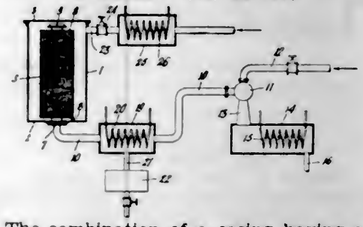
6. The invention set forth in claim 2 characterized in that the strip locating means is so arranged as to locate the strip with its sound track overlying the arcuate cutting edge of said fixed blade a distance sufficient to enable said movable blade to remove said track slightly beyond the limit of the area thereof covered by the scanning light beam of reproducing appara-



tus adapted to reproduce sound from said record, and the length of the notch formed in said strip being such that the time interval for passing said notch past said scanning beam is longer than the period of the lowest frequency that may be reproduced by said reproducing apparatus.

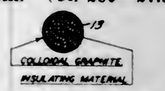
2,101,459
BRIEF CASE CONSTRUCTION
William Satz, New York, N. Y.
Application March 5, 1937, Serial No. 129,231
9 Claims. (Cl. 150—1.6)

1. In a brief case construction including side walls connected by gussets adjacent end and bottom peripheral edges of the side walls, one of which gussets forms the bottom, straps for supporting the bottom, the free ends of the straps being resiliently suspended to the side walls of the brief case adjacent the bottom portions thereof, to accommodate the suspension of the bottom to the distention or contraction of the brief case walls to and from each other.



2,101,460
SOUND MUFFLING DEVICE
Ulrich Schmidt, Berlin-Wilmersdorf, Germany
Application April 25, 1935, Serial No. 18,083
In Germany December 17, 1932
6 Claims. (Cl. 181—48)

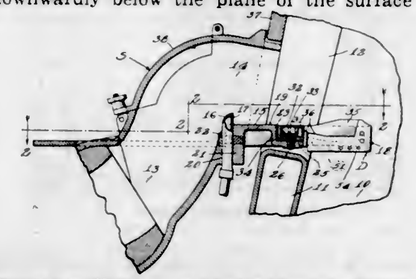
1. A sound muffler comprising a conduit providing a substantially unobstructed gas flow and having a circular opening, a closed imperforate annular chamber surrounding said conduit, a plurality of perforated partition walls arranged



substantially transversely to said conduit and dividing said chamber into a number of adjacent compartments, and packings of sound absorbing material filling alternate compartments, the central non-filled compartment having a width equal to said opening and communicating therethrough with said conduit to provide an acoustic coupling path therebetween and said conduit.

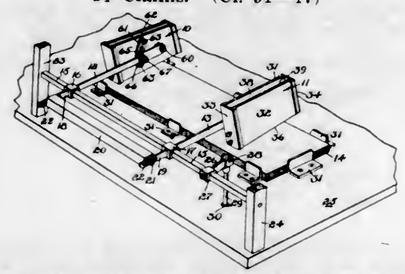
2,101,461
EXTRACTING AND DRYING SYSTEM
Ernest A. Stienen, New York, N. Y.
Application December 27, 1934, Serial No. 759,343
2 Claims. (Cl. 34—30)

1. The combination of a casing having a bottom wall and a cover for a material to be dried, a hollow perforated beam in the casing bearing on its bottom wall for supporting the material to be dried, a pipe to lead an inert gas into the casing, means to heat said inert gas before entering the casing, perforated piping to lead steam into the casing, a steam coil in the casing, a pipe leading from an opening in the bottom wall of the casing, a pre-cooling condenser connected to the latter pipe to condense steam flowing therethrough, a discharge pipe extending from said pre-cooling condenser to lead condensed steam therefrom, a steam jet evacuator for producing a vacuum in the casing, a pipe connecting the pre-cooling condenser and the steam jet evacuator, an outlet extending from the steam jet evacuator, a condenser connected to said outlet, a cooling coil in the latter condenser and an outlet for the latter condenser.



2,101,462
GRID
Russell H. Varian, San Francisco, Calif., assignor to Farnsworth Television Incorporated, a corporation of California
Application March 13, 1935, Serial No. 10,892
1 Claim. (Cl. 250—27.5)

A thermionic tube grid having a relatively high resistance to high frequency alternating currents and a relatively low resistance to direct current comprising a non-conducting vitreous foundation and a surface layer of graphite.

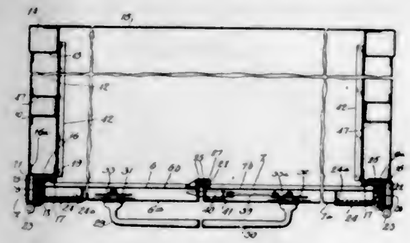


2,101,463
SECTIONAL FUEL DISTRIBUTOR
Howard P. Anderson, Erie, Pa., assignor to The Standard Stoker Company, Inc., a corporation of Delaware
Application November 24, 1933, Serial No. 699,525
4 Claims. (Cl. 110—101)

3. A sectional fuel distributing plate for stokers comprising a front section and a rear section, each of said sections having a fuel supporting surface, the forward portion of said rear section being provided with a recess intermediate the sides thereof, ledge-like supporting means extending forwardly from said rear section, below the level of its fuel supporting surface and between the sides and inner edges of said recess, said supporting means carrying a plurality of upstanding threaded projections, the portion of the fuel supporting surface of said rear section on each side of said recess sloping forwardly and downwardly below the plane of the surface of

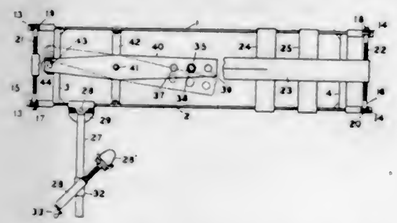
the rear section rearward of said recess, the rearward portion of said front section being provided with a rearward extension fitted in said recess and seated on said supporting means, said rearward extension engaging said threaded projections, and a threaded member engaging each of said threaded projections for firmly securing the front section to the rear section, said front section having lateral extensions lying in a plane below the surface thereof and forming pockets therewith, said extensions forming continuations of the sloping portions of said rear section.

2,101,464
ADHESIVE APPLYING DEVICE
Paul Arndt, Los Angeles, Calif.
Application August 14, 1936, Serial No. 96,069
14 Claims. (Cl. 91—47)



1. In a device for applying a fluent adhesive to a surface, a container for the adhesive, an adhesive applying member carried by the container, means for swinging the container angularly toward a surface upon which the adhesive is to be applied, means forming a series of apertures through which adhesive is supplied from the container to the applying member, and means for ensuring that the adhesive will be uniformly supplied to the applying member from the container through the series of apertures.

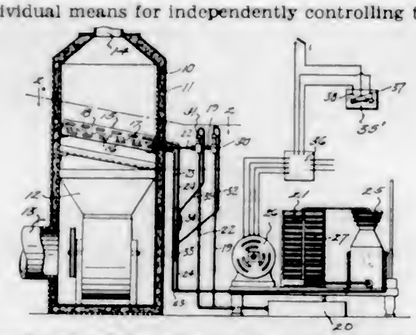
2,101,465
STORAGE CABINET
Harry F. Beers, Pelham, N. Y.
Application March 22, 1935, Serial No. 12,424
5 Claims. (Cl. 312—189)



1. A cabinet of the class described having sealed top, bottom, side and back walls, the

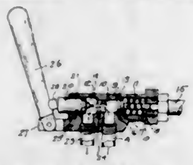
front of the cabinet being open, the peripheral edges of the top, bottom and side walls of the cabinet adjacent the front opening having a continuous channel arranged within the front surface of the cabinet, a strip of sponge rubber arranged in and extending throughout the length of said channel, said strip being substantially triangular in cross sectional form with the thick part of said strip arranged centrally of the

channel, a closure for the opening of said cabinet, said closure having projecting flanges adapted to engage said strip throughout the peripheral edges of the closure to form an air-tight connection between the closure and said cabinet, and means movably mounted in connection with the closure and engaging the cabinet to forcibly move the projecting flanges of the closure into firm engagement with said strip.



2,101,466
ORTHOPEDIC TABLE
William L. Bell, Oakland, Calif., assignor to Gilbert Hyde Chick, Oakland, Calif.
Application February 14, 1936, Serial No. 63,937
4 Claims. (Cl. 128—84)

1. An orthopedic table including a relatively narrow, taut, flexible strip, suspended above said table; a horizontal beam on a vertical pivot on said table, and having a perineal post in operative relation to said strip.

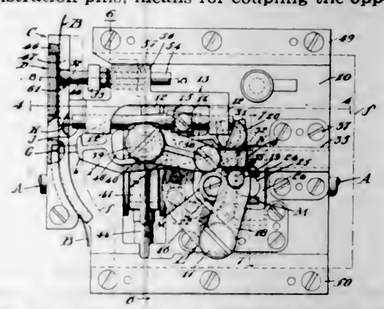


2,101,467
AIR CONDITIONING UNIT
Thomas W. Carraway, Dallas, Tex., assignor to Carraway Engineering Company, Inc., Dallas, Tex., a corporation of Delaware
Application March 21, 1935, Serial No. 12,153
7 Claims. (Cl. 62—129)

1. An air conditioning unit comprising a casing, means for passing air to be conditioned through said casing, a plurality of separate cooling elements within the casing successively through which the air is passed, the refrigerant being maintained at substantially the same temperature in the several cooling elements, and individual means for independently controlling the

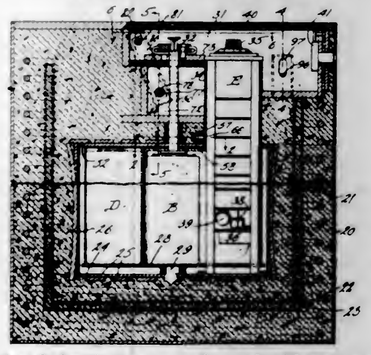
supply of refrigerant to each cooling element according to the load imposed on each element.

2,101,468
OIL DISPENSER
Arthur L. Dale, Tacoma, Wash.
Application September 11, 1935, Serial No. 40,086
2 Claims. (Cl. 277—20)



1. A control apparatus for an oil dispenser, having an air pressure line, an air-supply pipe, and a relief pipe attached thereto and comprising a fixed body having three connected chambers therein, the air pressure line entering the first chamber, the air-supply pipe entering the central or second chamber, and the relief pipe entering the third chamber; valve seats formed between said chambers, said valve seats opening outward from the central chamber; an automatic valve adapted to normally close the connection between said first and second chambers; a plug valve lying in the third chamber and normally open, thereby connecting the air-supply pipe with the relief pipe but adapted to be moved to close said connection; and a push rod adjustably mounted on said plug valve and extending inward therefrom into adjustable spaced relation with said automatic valve, whereby said automatic valve is engaged, after the said plug valve has closed off connection between the air-supply pipe and the relief pipe, to open said automatic valve a predetermined amount to connect the air pressure line with the air-supply pipe.

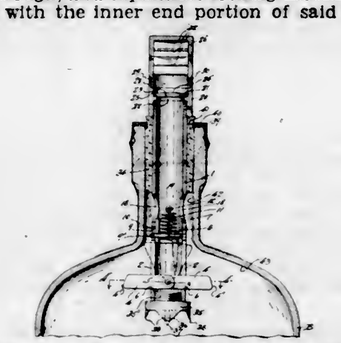
2,101,469
FILM MOVING MECHANISM
Herman Ray Ellinwood, Los Angeles, Calif.
Application February 11, 1935, Serial No. 5,923
13 Claims. (Cl. 88—18.4)



1. In a film movement the combination of a film guide, a claw arm adapted to intermittently move film in said guide, means for actuating said arm, a slide, a link attached to said arm connected to said slide operating to transfer longitudinal components to said slide moving along a plane perpendicular to the plane of said film guide, a pivot pin mounted on said slide, a lever supported on said pin intermediate its ends, means for coupling one end of said lever to said

claw arm to transfer components of motion parallel to the axis of the aforementioned slide, film registration pins, means for coupling the opposite

end of said lever to said film registration pins in such a manner that while the film engaging claw arm is out of engagement with the film said registration pins are engaged with film perforations.

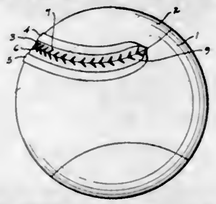


2,101,470
SAFE
Charles K. Ernst, Buffalo, N. Y.
Application January 3, 1936, Serial No. 57,380
16 Claims. (Cl. 109—1)

1. A safe having a space for valuables arranged in the interior thereof, means for locking said safe to prevent access to said valuables space, a passage in said safe and terminating at its inner end in said valuables space and through which articles may be deposited in said valuables space when said safe is locked, and means for closing said passage to prevent access to said valuables space through said passage, said means being movable into open position only when said means for locking said safe are unlocked.

2,101,471
NONREFILLABLE BOTTLE TAPPING DEVICE
Martin Greenbaum, Newark, N. J.
Application May 2, 1936, Serial No. 77,497
7 Claims. (Cl. 225—22)

7. Means for tapping a bottle through its original closure, comprising a cylindrical body having an outgoing passage to communicate with the bottle interior, an outwardly opening check valve in said passage, a discharge spigot at the outer end of said body adjacent to said check-valve, a freely rotatable turbine within said discharge spigot to prevent tampering access to said check-valve through said spigot, a cutter means at the inner end of said body for perforating the original bottle closure to admit passage of said body therethrough, and expansible locking means connected with the inner end portion of said body



for engagement beneath the bottle shoulders below the bottle neck thereby to inviolably secure said body in operative attachment to the bottle until the latter is destroyed.

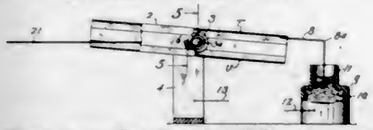
2,101,472
ANTIFREEZING MEANS
Frederick A. Kormann, Glendale, Calif.
No Drawing. Application November 20, 1934, Serial No. 753,904
3 Claims. (Cl. 134—27)

1. A surface coating for preventing the adherence of ice consisting of glycerol, and a collagenous material in the approximate proportions of eight parts of the glycerol and four parts collagenous material, said coating being characterized by having the property when applied of exuding glycerol.

2,101,473
BLIND STITCH PLAY BALL
George S. Lannom, Jr., Grinnell, Iowa, assignor to The Lannom Manufacturing Company, Grinnell, Iowa
Application October 16, 1935, Serial No. 45,179
3 Claims. (Cl. 273—60)

1. A blind stitch play ball consisting of a ball slug of relatively tough base material, a cover therefor cut into the form of two 8 shaped leather cover members; said cover members each having adjacent edges slit with the edge portions below the slits stitched together, a coat of latex vulcanized over said stitches and the edge portions of said cover members above the slits sealed down over the stitches to conceal and protect the same.

2,101,474
SUPPORTING DEVICE
Barnet S. Minters, Elmhurst, N. Y.
Application August 2, 1934, Serial No. 738,056
3 Claims. (Cl. 248—163)



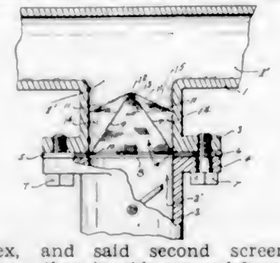
3. A support comprising a plurality of similar members each having a corner portion, and arms

diverging at an angle of 60°, the arms of each member contacting adjacent arms of adjacent members to form a triangular frame, one arm of each member having a plurality of openings, the other arm of said member having an extension adapted to be received in one of the openings of

an arm of an adjacent member, each pair of contacting arms having registering openings, a bolt extending through said registering openings, the corner portion of each member being formed with a tapped opening, and a pipe screwed within each tapped opening.

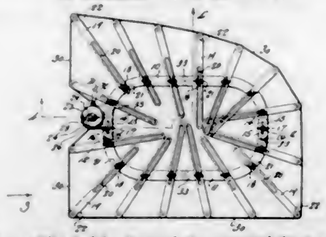
2,101,475
THERMAL CONTROL SWITCH
Oscar Joel Ostlind, Portland, Oreg.
Application October 13, 1936, Serial No. 105,372
15 Claims. (Cl. 200—140)

4. Heat control apparatus defined in part as a pivot point that is movable by heat sensitive apparatus, a wheel member spaced from said pivot point by a reach-rod that is effective to throw a switch by disturbing the balance of said switch upon movement of the wheel by the reach-rod and a carriage for the switch that is movably mounted to change the position thereof and thereby change the temperature range of operation of the switch without adjusting said heat sensitive apparatus.



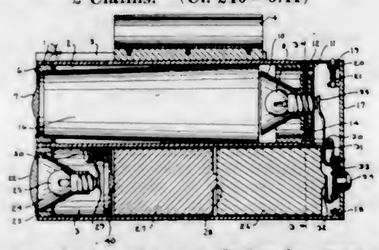
2,101,476
LEAF LOCK FOR OPHTHALMIC MOUNTINGS
Henry C. Petersen, Hillside, N. J., assignor to Lowres Optical Manufacturing Co., Newark, N. J., a corporation of New Jersey
Application May 22, 1936, Serial No. 81,259
4 Claims. (Cl. 88—47)

1. An ophthalmic mounting for spectacles and eye-glasses comprising a lens strap having arms for engaging opposite sides of the lens, one of said arms having a threaded aperture therethrough for receiving a lens screw and being vertically slitted, thereby providing inner and outer relatively yieldable arm portions, and a leaf lock pivotally mounted within said slit and having tapered surfaces for pressing said arm portions apart to thereby bind the same upon said lens screw.



2,101,477
GAS MIXER
Gerald A. Pickett, McKenzie Bridge, Oreg.
Application August 31, 1935, Serial No. 38,785
1 Claim. (Cl. 48—180)

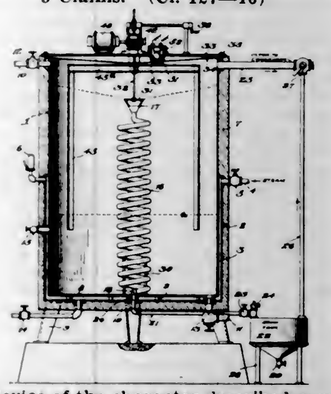
In a gas mixer, a connection provided with a passageway, a conical screen having its base mounted to the walls of the passageway in the connection and having its apex positioned above the connection, a second conical screen extending upright from its base and mounted upon the



first apex, and said second screen having greater taper than its sides spaced from the sides of the first and having its basal perimeter substantially equal to that of the first screen.

2,101,478
ADJUSTABLE TEMPLET
Frederick Reich, Elizabeth, N. J.
Application March 20, 1936, Serial No. 69,794
10 Claims. (Cl. 33—176)

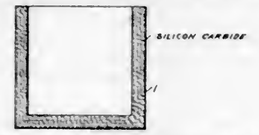
1. An adjustable templet, comprising a frame, a plurality of extensibly and angularly adjustable caliper bars radially extending from said frame, means to clamp said caliper bars in adjusted positions, the outer extremities of said caliper bars having guide means, a removable and extensible scribing guide cable to extend over said guide means and around the templet device.



2,101,479
NIGHT TARGET RANGE FINDER
Cleveland H. Schenk, Springfield, Ill.
Application March 22, 1935, Serial No. 12,342
2 Claims. (Cl. 240—6.41)

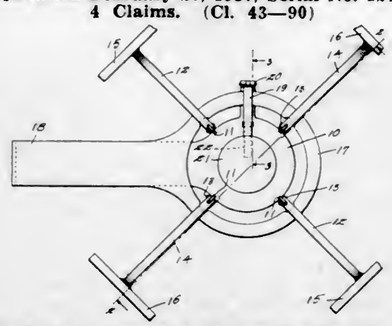
1. A night target range finder for guns comprising a two compartment casing provided along the top with an elongated resilient grip slidably secured to the casing for engaging a gun barrel for the support of the casing, the upper of said compartments in the casing provided with a light, an adjustable mounting for the light, with a plurality of adjusting screws; said mounting

with said light disposed adjacent the rear of the top compartment in the casing, a lens adjustably mounted in the forward end of said upper compartment; said lens having a central concentrating portion and a peripheral portion having plane parallel faces and an adjustable reflecting tube extending a major portion of the distance from said lens to said light and having a greater diameter at the rear end than the front end, an integral second and lower compartment in said casing, an electric light mounted adjacent the forward end of said compartment, and lens means cooperating with said light, batteries mounted in said casing and operatively connected with both of said electric lights and an electric switch operatively connected in the circuit between said batteries and said lights for the selective control of said lights; whereby the operator may turn on either light by itself or both lights together and whereby said upper light with its lens may focus a bright spot of light on a target and whereby a flood of light may be thrown about said focused spot of light when desired.



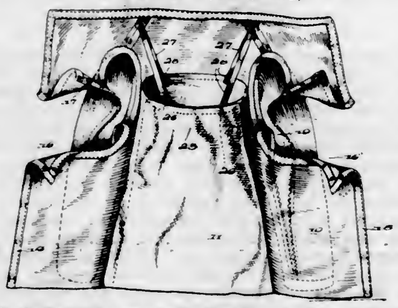
2,101,480
APPARATUS FOR CLARIFYING SACCHARINE LIQUIDS
David F. Smith, Takoma Park, Md.
Application April 26, 1935, Serial No. 18,467
5 Claims. (Cl. 127—16)

3. A device of the character described comprising in combination a vessel, a steam-jacket for heating said vessel, vacuum connections to said vessel, a removable cover for the vessel, a stirrer rotatably mounted in, and depending from, said cover and adapted to impart a centripetal movement to the scum, means to rotate the stirrer mounted upon the cover, a flexible discharge-coil mounted within the vessel concentric with the stirrer, means for adjusting the height of the discharge-coil, a scum-tank, connections from the discharge-coil to the scum-tank, and connections from the scum-tank to the said first mentioned vacuum connections.



2,101,481
HEAT TREATING CONTAINER
Harold J. Stein, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Continuation of application Serial No. 622,238, July 13, 1932. This application May 12, 1936, Serial No. 79,312
4 Claims. (Cl. 263—48)

1. A container for use in heat treating metallic articles with gases evolved at high temperatures from a heat treating compound in which the articles are embedded, said container being com-

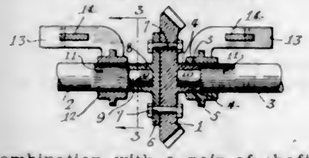


posed of granular silicon carbide, and a ceramic bond, the bonded mass having a heat conductivity substantially higher than that of fire clay.

2,101,482
ANIMAL TRAP
Julius Tschantre, New City, N. Y.
Application February 23, 1937, Serial No. 127,238
4 Claims. (Cl. 43—90)

1. A trap comprising a base member, a plurality of opposed arms pivoted to said base member, jaws carried by the free ends of said arms and extending at right angles to the length thereof, said jaws being longitudinally curved with the concave sides thereof in confronting relation when said jaws are in clamping position, an annulus engaging beneath said arms when in opened or set position, a substantially U-shaped spring having one leg thereof secured to said base and the other leg thereof secured to said annulus, and releasable holding means carried by said base for holding said annulus in set position.

2,101,483
BURIAL GARMENT
Hazel H. Woods, Greenville, Ohio, assignor of forty-eight per cent to Adam W. Lynn, Arcanum, Ohio
Application August 17, 1936, Serial No. 96,529
2 Claims. (Cl. 2—64)



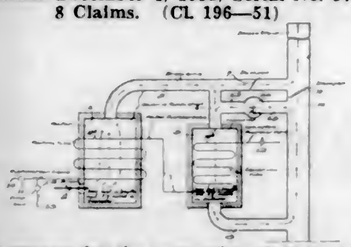
1. A burial garment having front, side and sleeve portions, said front portion having a longi-

tudinal opening which extends throughout the length of the garment, said sleeve portions having longitudinal openings extending throughout the length of the sleeve, a transverse opening in the said front and openings in the said sides of said garment for connecting and communicating with the said transverse openings and the openings in the sleeve portions.

2,101,484

CLUTCH MECHANISM

Denis Vermette, Montreal, Quebec, Canada
Application May 10, 1937, Serial No. 141,720
1 Claim. (Cl. 192—48)

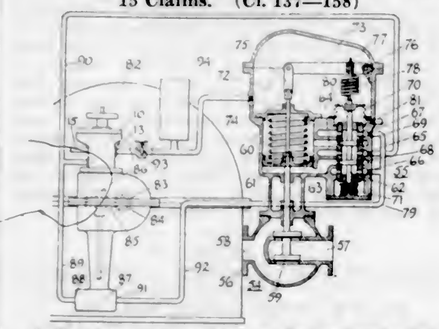


In combination with a pair of shafts having clutch elements formed thereon, an intermediate member between said shafts, clutch members formed at opposite sides of said intermediate member and complementary to the first-named clutch elements, a coupling device associated with each clutch element and the complementary clutch member, an arm extending from each coupling device, a guided shifting plate slidable transversely through each arm, each plate having an oblique slot, an extension from each arm into the corresponding slot, and means for separately sliding said plates, springs associated with said plates and adapted to move each plate in a given direction, one spring being adapted to move its plate in the clutching direction and the other to move its plate in the declutching direction.

2,101,485

PROCESS AND APPARATUS FOR THE CONVERSION OF HYDROCARBON LIQUIDS AND GASES

Malcolm P. Youker, Bartlesville, Okla., assignor to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware
Application December 4, 1931, Serial No. 579,044
8 Claims. (Cl. 196—51)

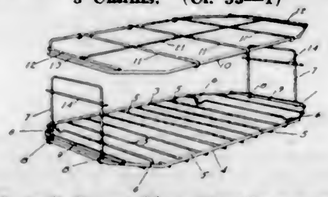


3. A process for the conversion of hydrocarbon fluids, comprising passing a hydrocarbon fluid through a portion of a tube in a heating chamber, generating gases of combustion in said chamber and contacting said gases with said portion of the tube for heating the fluid to conversion temperatures, passing the fluid from said portion of the tube while so heated through a conversion portion of the tube arranged in a conversion chamber, discharging the gases of combustion from the heating chamber and dividing the discharged gases into first and second streams, discharging the first stream from the process, passing the second stream through the conversion chamber, and recirculating without reheating a portion of the second stream from the heating gas outlet of the conversion chamber back into the second stream as the latter enters the conversion chamber.

2,101,486

PRIME MOVER GOVERNING SYSTEM

Victor I. Zelov, Rosemont, Pa., assignor to Co-operative Engineering Co., Philadelphia, Pa., a corporation of Delaware
Application April 3, 1935, Serial No. 14,404
15 Claims. (Cl. 137—158)

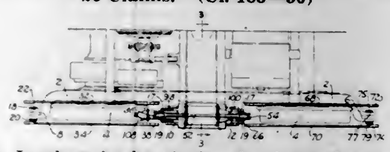


1. In a governing system for a prime mover having an admission valve and means for operating the admission valve and including a pressure-responsive control device, a combination of means for developing centrifugal forces varying as a function of the speed of the prime mover, a plunger construction having an abutment for receiving said centrifugal forces and having a plurality of pressure faces, a housing around the plunger construction defining pressure chambers with said pressure faces, means responsive to an operating condition other than the speed of the prime mover and providing an external control fluid pressure varying as a function of said operating condition, means to conduct said external control fluid pressure to one of said pressure chambers, means including said plunger and responsive to centrifugal force and said external control fluid pressure to provide a secondary fluid pressure, means for supplying fluid under secondary pressure to the second of said pressure chambers to balance the centrifugal and the external control fluid pressure, and means for supplying fluid under secondary pressure to said pressure-responsive device.

2,101,487

RACK FOR COOKING UTENSILS

Carl R. Anderson, Erie, Pa., assignor to The Griswold Manufacturing Company, Erie, Pa., a corporation of Pennsylvania
Application February 12, 1936, Serial No. 63,513
3 Claims. (Cl. 53—1)

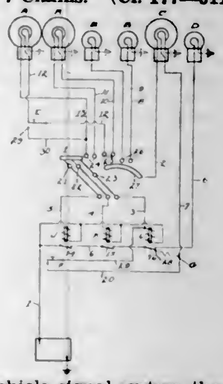


1. A rack for cooking utensils comprising a wired grid comprising a surrounding frame and cross bars; wire handles in the form of U shaped bails having eyes at their ends through which the bails are pivotally secured on the rack frame in foldable relation to the rack; and a top rack formed of wire comprising a surrounding frame and spacing wires extending from edge to edge of the frame, the said rack having cross bars adjacent to the ends of the frame providing slots for receiving the handles, said handles having cross wires extending from side to side of the bail forming positioning stops for the top rack and bracing the bail.

2,101,488

CLASP BRAKE

Walter H. Baselt, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application December 28, 1935, Serial No. 56,513
26 Claims. (Cl. 188—56)

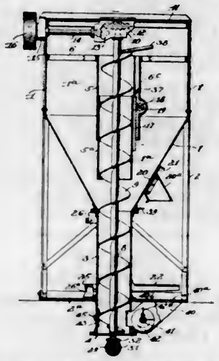


1. In clasp brake rigging for four wheel railway car trucks, the combination of a truck frame, dead truck levers pivotally supported from said truck frame outwardly of the wheels thereof, live truck levers supported intermediate the wheels, straps connecting the lower ends of the live and dead truck levers for each wheel, a brake head pivotally mounted on each of said live and dead truck levers intermediate the ends thereof, hangers carried on said truck frame intermediate the wheels and having their lower ends operatively connected to said live truck levers at the said pivotal points where said brake heads are carried, links connecting the upper ends of said live truck levers to vertically disposed live and dead cylinder levers, a cylinder mounted on said truck intermediate the wheels thereof and having a piston operatively connected to said live cylinder lever, a slack adjuster mounted on said cylinder at the end opposite said piston, and a pivotal connection between said slack adjuster and said dead cylinder lever.

2,101,489

APPARATUS FOR INDICATING AN OPERATIVE CONDITION OF VEHICLE LIGHTS

Harry Lee Black, Toronto, Ontario, Canada
Application May 4, 1935, Serial No. 19,801
7 Claims. (Cl. 177—311)



1. In a vehicle signal system the combination of a running light; a circuit therefor; an electromagnet in said circuit; a signal light; a signal light circuit normally open; a switch therein controllable by the electromagnet to close the signal light circuit when the electromagnet is deenergized and thus substitute the signal light for the running light; an indicator light; an indicator light circuit; a switch in said indicator circuit controllable by the electromagnet to close the indicator circuit when the magnet is energized and the running light circuit is operative; a resistance in the circuit of the signal light to dim its maximum luminosity; a shunt circuit connected with the signal light circuit adapted, when closed, to by-pass the resistance and the switch in the indicator circuit; and a switch in the shunt circuit adapted to open and close said circuit.

2,101,490

MIXING MACHINE

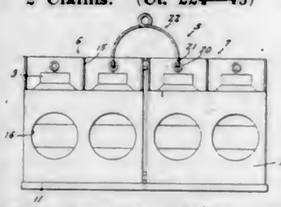
Fred J. Bullock, deceased, late of Shortsville, N. Y., by Violet V. Bullock, administratrix, Rochester, N. Y., and Ward H. Preston, Shortsville, N. Y., assignors to Papec Machine Company, Shortsville, N. Y., a corporation of New York
Application May 15, 1936, Serial No. 79,948
15 Claims. (Cl. 259—97)

1. In a mixing machine, a casing having a mixing chamber provided with an outlet, means operable within said chamber to mix the material therein, operating means for said last mentioned means, a support for a container for receiving the material discharging from said outlet, said support being mounted for bodily movement downwardly from a normal inoperative position to a predetermined position under a predetermined weight of material within the container, and means actuated by said operating means for periodically raising the support and the container thereon subsequent to movement of the same to said predetermined position whereby to cause the material to become compacted within the container, said last mentioned means being inoperative with respect to said support except upon movement of the support to said lowered position.

2,101,491

FISHHOOK

Langdon S. Chilcott, Brewer, Maine
Application April 30, 1936, Serial No. 77,229
1 Claim. (Cl. 43—27)



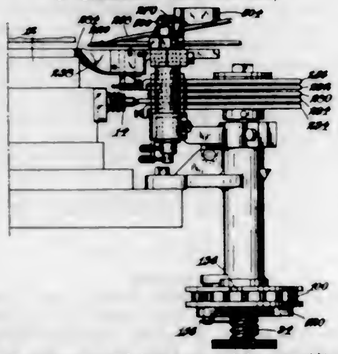
In a fish hook, a single wire having one of its extremities provided with line-attaching means and having its other extremity bent to form a return-bend hook, the single reach of

said wire between said line-attaching means and said return-bend hook constituting a shank the lower portion of which is bent obliquely in one direction and then obliquely in the other direction, providing a V-formation whose upper and lower arms extend above and below the hook point respectively, disposing the crotch of the V substantially opposite said hook point, said V-formation being disposed in a plane at substantially right angles to the plane of said return-bend hook and having both its upper and lower arms laterally unobstructed in all directions, the portion of said shank between said V-formation and said line-attaching means being longer than the vertical width of said V-formation, being straight, being substantially unidirectional

with the pointed end of said return-bend hook and being laterally unobstructed in all directions, said V-formation and said straight shank portion being so proportioned with respect to said return-bend hook that the fish may take said return-bend hook, said V-formation and part of said straight shank portion into his mouth and close his jaws upon said straight shank portion, whereby when a pull on the line causes longitudinal sliding movement of said straight shank portion between the fish's closed jaws with the return-bend hook lying in a plane substantially parallel with said jaws, said V-formation will abut one of said jaws and turn the entire hook to jaw-penetrating position as said V-formation slides outwardly between said jaws.

2,101,492
UTILITY HOLDER
Charles W. Cogswell, Elizabeth, N. J.
Application November 7, 1936, Serial No. 109,777
2 Claims. (Cl. 224—45)

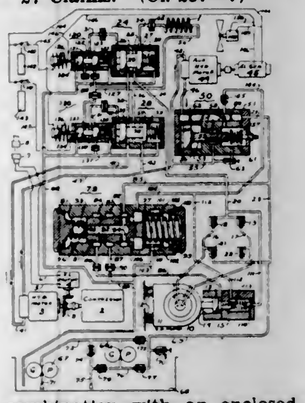
1. A display case and container comprising a pair of container sections hinged together for relative swinging movement into back to back relation, said sections each having a back wall provided with a pair of longitudinally spaced apertures therein, the apertures of one wall registering with those of the other in the back to back relation of said sections, and a handle having hooked ends for insertion into the registering apertures of said pairs.



2,101,493
COLLAR CLASP
Arthur W. Crain, Providence, R. I.
Application April 16, 1936, Serial No. 74,764
Renewed June 3, 1937
10 Claims. (Cl. 24—81)

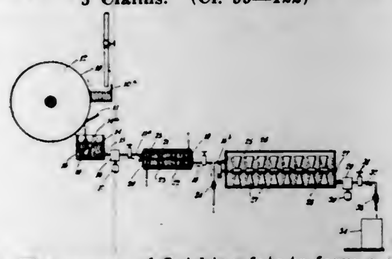
9. A combined collar clasp and necktie holder comprising a frame having oppositely projecting relatively rigid integral arms thereon arranged to engage behind the tabs of the collar, oppositely projecting swingable arms pivoted on said frame for engaging the front of the collar tabs in opposition to said rigid integral arms, tie clasping means mounted on said frame and including opposed elements pivoted on said frame and arranged to encircle the tie when in closed position, said opposed elements being formed with

cams engageable with said swingable arms when said opposed elements are swung from open to closed position so as to clamp said swingable arms against the front of the collar tabs, said frame being U-shaped in cross section and U-shaped in plan, said relatively rigid integral arms projecting laterally outwardly from the ends of the bight of said frame in longitudinal alignment with said bight.



2,101,494
CIRCULAR KNITTING MACHINE
Frederick Edward Deans, Charles Frederick Manger, and George Alfred Buswell, Leicester, England, assignors to The Bentley Engineering Company Limited, Leicester, England, a British company
Application March 4, 1936, Serial No. 67,162
In Great Britain March 14, 1935
3 Claims. (Cl. 66—14)

1. A knitting machine comprising a stitch cam movable between a needle-actuating position and an idle position, a plurality of thread feeders each independently movable between a thread-feeding position and an idle position, thread trapper and cutter devices each associated, respectively, with one of said feeders to trap and cut and to release thread fed from said thread feeder, operating mechanism for operating said stitch cam, thread feeders, and trapper and cutter devices, which operating mechanism during the knitting of an article by the machine is moved from an initial position in a series of steps formed into sections by pauses in the movement of said mechanism at predetermined points in the operation of the machine, driving means for driving said mechanism, stopping means for automatically stopping the driving action of said driving means at the end of each of said sections, starting means for starting said driving action at the beginning of each of said sections, pattern control means, devices on said pattern control means for actuating said starting means, and a correcting mechanism comprising an adjustable

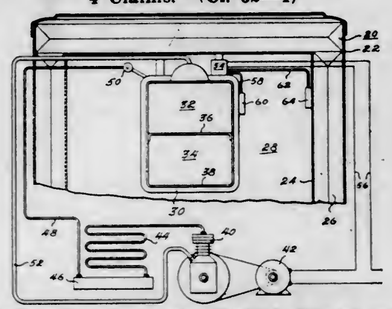


element, operative connections between said element and said operating mechanism arranged to maintain said element normally in operative relation with said starting means but to move said element out of such relation when the said operating mechanism is in its initial position, and a device on the pattern control means for operating said element at a time in the operation of the machine at which the operating mechanism should be in its initial position, whereby if the relation between the pattern control means and the operating mechanism has been disturbed, the starting means will be actuated by said element and will cause the driving means to drive the operating mechanism into its initial position.

2,101,495
HYDRAULIC TRANSMISSION
Walter Ferris and James K. Douglas, Milwaukee, and George H. Fobian, West Allis, Wis., assignors to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin
Application October 23, 1935, Serial No. 46,328
27 Claims. (Cl. 257—7)

1. The combination with an enclosed space, and air conditioning apparatus to cool said space, of a hydraulic motor for driving said apparatus, a radiator arranged within said space to cause liquid forced therethrough to heat said space, a pump, means for directing liquid from said pump to said motor and to said radiator selectively, and means for driving said pump.

2,101,496
METHOD OF FINISHING SHORTENING
Truman M. Godfrey Winchester, Mass., and Victor Serbell, Leonia, N. J., assignors to Lever Brothers Company, a corporation of Maine
Application October 2, 1934, Serial No. 746,518
5 Claims. (Cl. 99—122)



1. The process of finishing fats to form a substantially dry plastic shortening, which comprises chilling the fat to a semi-solid form, aerating the chilled fat, simultaneously heating and agitating the aerated fat, forcing the heated and agitated fat through a small texturizing orifice under pressure, allowing the fat to move slowly without any material addition or subtraction of heat, and again texturizing the fat under pressure through a second small orifice.

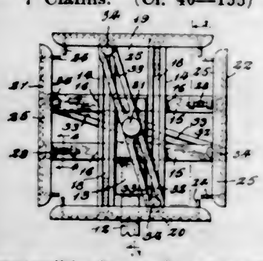
2,101,497
SOLVENT REFINING OF MINERAL OIL
James H. Grahame, Mount Vernon, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
No Drawing. Application August 10, 1935, Serial No. 35,632
4 Claims. (Cl. 196—13)

1. The method of separating hydrocarbon oil containing high viscosity and low viscosity index constituents into fractions which are respectively rich in high viscosity index and low viscosity index constituents, which comprises extracting the oil with furfural in the presence of beta trichlorethane, forming an extract phase containing low viscosity index constituents dissolved in solvent liquid and a raffinate phase comprising relatively high viscosity index constituents, and separating the two phases.

2,101,498
REFRIGERATING APPARATUS
Albert O. Grooms, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application June 27, 1935, Serial No. 28,685
4 Claims. (Cl. 62—4)

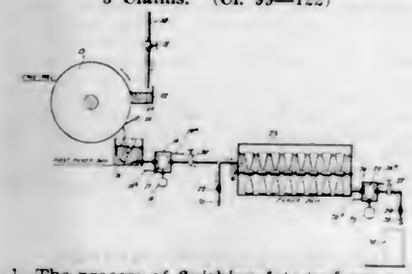
1. Refrigerating apparatus including an enclosure containing a fluid to be kept cool, a system associated with said enclosure comprising a cooling element in heat exchange relation with the fluid in the enclosure and a cooling medium circulating unit outside the enclosure, means dependent solely upon the temperature of the cooling element and providing the main control for normally controlling the operation of said circulating unit, and means disposed within said enclosure out of intimate thermal contact with said cooling element and acting directly upon said temperature dependent main control means for regulating same in response to the temperature of ambient fluid in said enclosure.

2,101,499
ELECTRIC LIGHTING FIXTURE
Harry D. Hain, Cleveland, Ohio, assignor to Railley Corporation, Cleveland, Ohio, a corporation of Ohio
Application October 28, 1935, Serial No. 47,058
5 Claims. (Cl. 240—128)



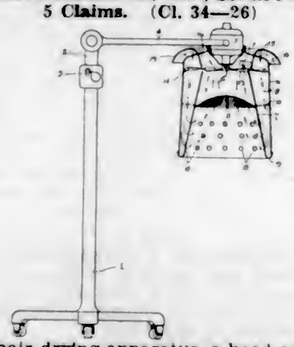
1. A shade fixture for a plurality of lamps comprising a shade element adapted to enclose

a plurality of adjacently positioned lamp and receptacle units and to abut against a surface from which such units project and yieldable means resiliently connecting said units with said shade element, the points of connection of said yieldable means to said units being more remote from said surface than the point of connection of the same



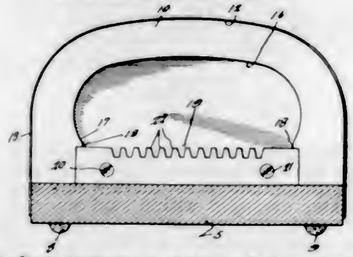
to said shade when said shade is in normal contact with said surface, said yieldable means including a member having an opening adapted to receive an electric bulb, spaced connecting members connecting to said member at spaced points and to a rim of said shade at spaced points, and spring means tending to effectively lengthen said connecting members.

2,101,500
EXPANSIBLE FRAME AND SUPPORT
Leon J. Jagus, Chicago, Ill.
Application May 17, 1937, Serial No. 143,183
7 Claims. (Cl. 40—155)



1. An expansible frame for supporting a display card comprising frame sections, each section having a slide bar, a channel bar slidably receiving each slide bar, oscillatable arm members positioned outwardly of respective channel bars, each arm having a longitudinally extended slot adjacent its ends, and a pin on each slide bar movable throughout the length of respective complemental slots.

2,101,501
PROCESS FOR FINISHING FATS
Harry A. Keck, Teaneck, N. J., assignor to Lever Brothers Company, a corporation of Maine
Application July 23, 1935, Serial No. 32,713
3 Claims. (Cl. 99—122)

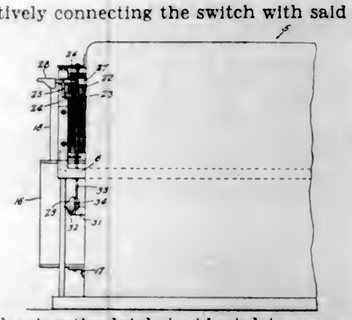


1. The process of finishing fats to form a substantially dry plastic shortening, which comprises chilling the fat to a semi-solid form, aerating the chilled fat, simultaneously agitating, heating and propelling the fat, and forcing it through a small texturizing orifice under pressure.

2,101,502
HAIR DRYING APPARATUS
John M. Keller, Lakewood, Ohio
Application December 28, 1931, Serial No. 583,468
5 Claims. (Cl. 34—26)

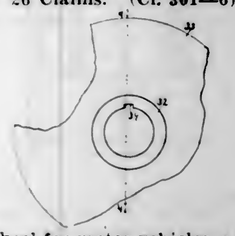
1. In hair drying apparatus, a hood adapted to be placed over the users head and comprising spaced inner and outer shells, means closing the lower end of the space between said shells, apertures in the lower portion of said inner shell, and a fan mounted across the upper end of said shells and having blades provided with oppositely pitched areas respectively opposite the spaces defined by said shells.

2,101,503
FOOT EXERCISING DEVICE
Frederick W. Lang, Forsyth, Ga.
Application July 2, 1935, Serial No. 29,561
Renewed June 23, 1937
4 Claims. (Cl. 128—57)



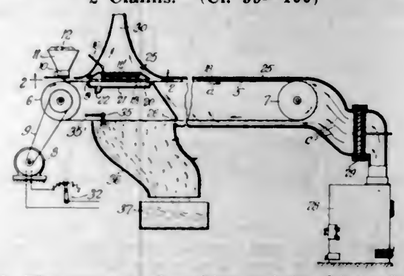
1. A foot exercising device of the character described comprising a base, standards at the opposite ends of the base, a roller having its opposite ends confined in recesses formed in said standards and arranged to be rolled back and forth across the base and the opposite ends of said roller having removable members inset therein and having exposed portions rolling on the floor of the recesses.

2,101,504
TOASTING APPARATUS
Clayton W. Malmquist, Minneapolis, Minn.
Application December 3, 1936, Serial No. 114,047
3 Claims. (Cl. 219—19)



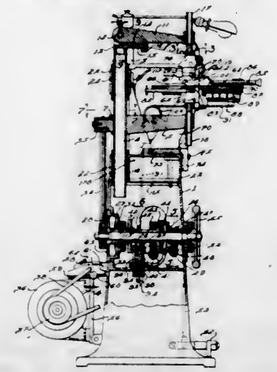
1. In a toaster having a vertically shiftable bread rack, spring means connected with the bread rack for normally urging the same upwardly to a toast-ejecting position, latch means mounted on the toaster for releasably retaining the bread rack against the action of said spring means in a lowered position, a solenoid having a reciprocating armature connected with the bread rack for lowering the latter upon the energization of the solenoid, a switch for closing the circuit through the solenoid, and means

operatively connecting the switch with said latch



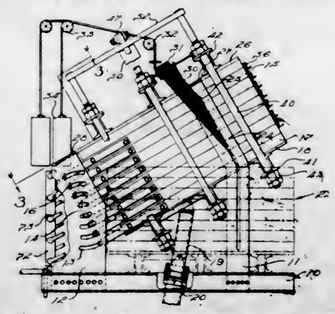
for releasing the latch incidental to an opening of the circuit through the solenoid.

2,101,505
WHEEL FOR MOTOR VEHICLES
Richard B. Miller, Detroit, Mich., assignor, by mesne assignments, of fifty per cent to Bernice Miller, Cleveland Heights, Ohio, and fifty per cent to Florence R. Magid, Brooklyn, N. Y.
Application March 31, 1932, Serial No. 602,122
Renewed December 29, 1934
26 Claims. (Cl. 301—6)



8. In a wheel for motor vehicles, a hub member formed of two parts, the inner part comprising a brake drum member formed with a central tubular portion and a web wall adapted to form a backing for a brake member proper, the outer part of said hub comprising a cylindrical portion adapted to engage over said tubular portion and provided with radially extending means adapted to lie flush against the peripheral portion of said web wall, a brake member proper of hard wear-resisting material engaged in said backing portion, and means for securing the parts in assembled relation.

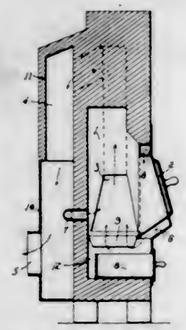
2,101,506
PROCESS OF MAKING DEHYDRATED POTATO CHIPS
Eva M. Morrow and Forrest L. Morrow, Elgin, Ill.
Application September 10, 1934, Serial No. 743,366
2 Claims. (Cl. 99—100)



1. The process of making potato chips which comprises dividing a potato into thin pieces, subjecting the thin pieces to steam treatment to semi-cook the same to a glazed or blanched condition, dehydrating the thin pieces, immersing said thin pieces in water only momentarily and without prolonged soaking to rehydrate the same, and thereafter cooking said thin rehydrated pieces into the form of thin, crisp potato chips by immersing the same in oil at a temperature over 250° F.

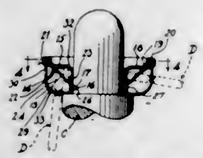
2,101,507
SAWING OR FILING MACHINE
Edd C. Oliver, Adrian, Mich.
Application August 22, 1934, Serial No. 740,940
8 Claims. (Cl. 29—74)

1. A machine of the character described comprising a base, a reciprocable member thereabove, a tool reciprocable thereby, a work table supported by the base and apertured to permit reciprocation of the tool, a feed mechanism for the work, comprising a slide, a screw adjustable in the slide and engaging the work, means for applying hydraulic pressure to the slide to move the screw and therefore the work toward the cutting tool, and means limiting movement of the slide by the hydraulic pressure to a distance less than that required to complete the work.



2,101,508
APPARATUS FOR MANUFACTURING MATS
Harry M. Pryale and Samuel C. Clark, Pontiac, Mich., assignors to Baldwin Rubber Company, Pontiac, Mich., a corporation of Michigan
Application March 22, 1934, Serial No. 716,772
14 Claims. (Cl. 18—17)

1. A molding apparatus comprising upper and lower relatively movable crown plates, a plurality of decks disposed in superposed relation between

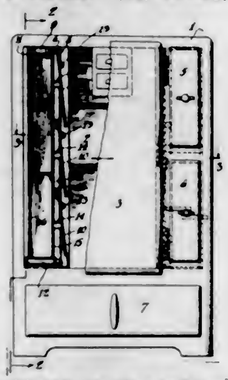


the crown plates, and means pivotally mounting the decks and one of the crown plates for pivotal movement between two angularly related positions wherein the decks are substantially parallel and superposed in either position.

2,101,509
STOVE FOR DOMESTIC PURPOSES
Isak Räsänen, Helsingfors, Finland
Application January 10, 1935, Serial No. 1,219
In Finland February 28, 1933
2 Claims. (Cl. 126—75)

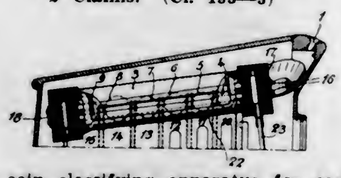
1. A stove made of brickwork and sheet metal, said stove having a combustion chamber and a fire door for the introduction of the fuel into the combustion chamber, a grate and an ash pit at the bottom of the combustion chamber, a flue at each side of the combustion chamber for conveying the hot gases upwardly and then rearwardly, a chamber at the rear of the stove into the top of which the hot gases are delivered by said flues to flow downwardly through said rear chamber, a flue at the bottom of the stove for conveying the gases from said rear chamber, the lower portion of said rear chamber having a sheet metal wall only for the rapid dissipation of heat to the room to be heated, substantially as described.

2,101,510
UMBRELLA STRUCTURE
Homer E. Rathbun, Los Angeles, Calif., assignor to Kenneth T. Norris, Los Angeles, Calif.
Application September 20, 1935, Serial No. 41,441
9 Claims. (Cl. 135—28)



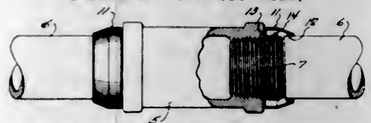
7. An umbrella structure comprising: a frame rod attaching unit, frame rods hingedly connected with said attaching unit, said unit embodying an outer member having an arcuate wall with radially disposed slots therein and an inner member secured thereto, said rods having their inner ends notched and interlocked with said slots, and means intermediate said outer member and said inner member for limiting the swinging movement of said rods.

2,101,511
SOLE LEATHER AND PROCESS OF PREPARING THE SAME
Otto Röhm, Darmstadt, Germany
No Drawing. Application June 29, 1936, Serial No. 88,057. In Germany July 2, 1935
6 Claims. (Cl. 149—4)



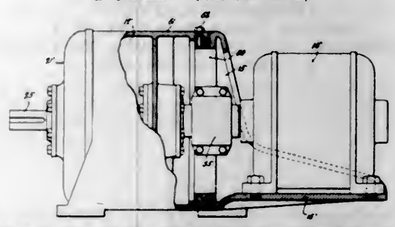
1. A process for preparing sole leather which comprises first tanning hides with sulphite cellulose extract before any silicic acid is added, and in a subsequent step filling with silicic acid solution.

2,101,512
REFRIGERATOR
Watson B. Rulon, Atlantic City, N. J.
Application August 25, 1936, Serial No. 97,756
3 Claims. (Cl. 62—89)



1. The combination with a refrigerator, of partition means dividing the interior thereof into a main compartment and an auxiliary compartment independently accessible from the exterior of the refrigerator, said partition means including one or more movable shutters which when open tend to establish air communication between the compartments and which when closed tend to prevent such communication, a door giving access to the main compartment, a drawer, independent of said door, slidably mounted in said auxiliary compartment, and means controlled by the opening and closing movements of said drawer to close the shutter or shutters when the drawer is opened and to open the shutter or shutters when the drawer is closed.

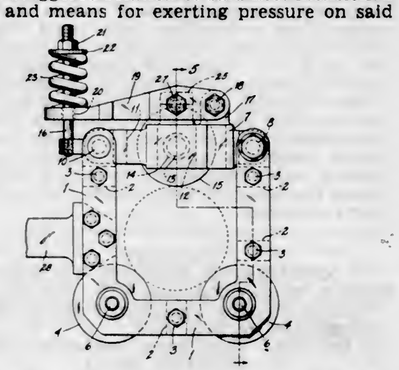
2,101,513
COIN SORTING DEVICE
Hjalmar Samuelsen, Oslo, and Jakob de Rytter Kielland, Vinderen, near Oslo, Norway
Application February 4, 1936, Serial No. 62,358
In Norway February 12, 1935
2 Claims. (Cl. 133—3)



2. A coin classifying apparatus for cash or change devices and the like comprising a sorting plate having a floor, a conveyor belt for moving coins over said plate disposed at an angle to said floor and means resiliently urging said conveyor belt against said plate whereby said conveyor belt urges said coins against said plate and also against said floor.

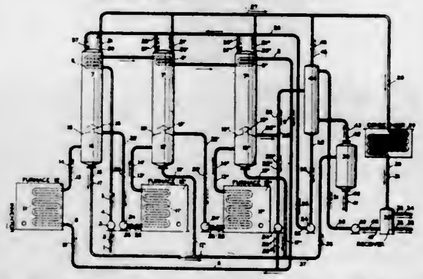
2,101,514
PIPE THREAD PROTECTOR
Louis R. Schmaus, Milwaukee, Wis., assignor to The NoKoRode Company, Milwaukee, Wis., a corporation of Wisconsin
Application April 17, 1935, Serial No. 16,737
4 Claims. (Cl. 285—146)

1. In combination with a pipe fitting and a pipe threaded into the fitting, said pipe having a threaded portion extending beyond the fitting, a protector ring covering said threaded portion of the pipe and having a snug face to face contact with the adjacent end of the fitting and a firm close fitting contact with the outer wall of the unthreaded portion of the pipe, said protector ring being formed of a ductile metal so as to be capable of stretching as it is moved along the increasing diameter of the pipe thread during threading of the pipe into the fitting without interfering with the proper securement of the pipe to the fitting.



2,101,515
GEARED MOTOR
Walter P. Schmitter, Milwaukee, Wis., assignor to The Falk Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application July 28, 1933, Serial No. 682,542
1 Claim. (Cl. 74—421)

In a device of the character described the combination of a casing having an end flange, a closure wall within said flange, a removable end head at the other end of said casing, a driven shaft journalled in said end head and projecting therefrom, speed reduction gearing within said casing for driving said shaft, a motor bracket having a portion removably fixed to said flange and also having a plate-like portion extending therefrom, a footed motor for driving said gearing, and means for attaching the feet of said motor to said plate-like portion to position and support the motor.

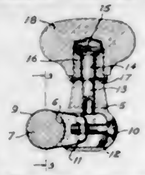


2,101,516
APPARATUS FOR COLD ROLLING AXLE JOURNALS
William L. Scribner and Tracy V. Buckwalter, Canton, Ohio, assignors to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio
Application June 6, 1936, Serial No. 83,940
4 Claims. (Cl. 80—22)

1. An apparatus for cold rolling axle journals and the like which comprises a C-shaped frame having a pivoted throat latch across its open top side, longitudinally convex rollers in its lower corners, a lever pivotally mounted on said throat latch, a yoke vertically slidable on said throat latch and operatively connected to said lever to be movable therewith, a roller mounted in said yoke in staggered relation to said first mentioned rollers and means for exerting pressure on said

lever, said means comprising a threaded rod on the end portion of said throat latch extending transversely beyond said lever and having a nut thereon and a helical spring bearing against said nut and said lever, and means for detachably locking said throat latch in position, said locking means consisting of an easily withdrawable locking pin extending through said throat latch and fitting in bores in the frame.

2,101,517
HYDROCARBON OIL CONVERSION
Jean Delattre Seguy, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application July 5, 1932, Serial No. 620,776
Renewed March 10, 1937
10 Claims. (Cl. 196—49)

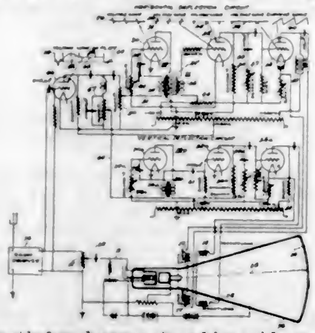


1. In a process for the conversion of hydrocarbon oil wherein the oil is subjected to conversion temperature at superatmospheric pressure in a heating coil and communicating enlarged reaction chamber, wherein vaporous and residual liquid conversion products separate, vapors from the reaction chamber subjected to fractionation, reflux condensate from the fractionator subjected to further conversion at superatmospheric pressure in a separate heating coil and communicating enlarged reaction chamber wherein vaporous and residual liquid conversion products separate, vapors from said separate reaction chamber subjected to separate fractionation, reflux condensate from said separate fractionator subjected to further conversion at super-

atmospheric pressure in another separate heating coil and communicating enlarged reaction chamber wherein vaporous and residual liquid conversion products separate and vapors from the last mentioned reaction chamber subjected to separate fractionation, and the overhead vapors from the fractionation stages condensed and collected, the improvement which comprises withdrawing unvaporized residual oil from each reaction chamber, commingling the residual oils and subjecting them to further vaporization at reduced pressure, subjecting the resulting vapors to fractionation, supplying to the last mentioned fractionating stage reflux condensate from the fractionator to which vapors from the last mentioned reaction chamber are supplied and returning reflux condensate from said last mentioned fractionating stage to the system for further conversion.

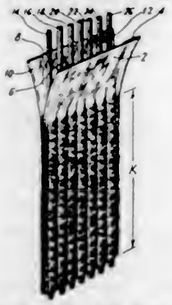
2,101,518
METALLIZED FIBROUS PACKING
Hugh T. Stewart, Palmyra, N. Y., assignor to The Garlock Packing Company, Palmyra, N. Y., a corporation of New York
No Drawing. Application September 26, 1935, Serial No. 42,283
1 Claim. (Cl. 288—1)

A braided or woven packing material consisting of yarns, the individual strands of which have a coating of powdered metal adhesively bonded thereon prior to the braiding or weaving of the strands into a body of definite dimensions.



2,101,519
STEERING WHEEL SPINNER KNOB
Joel R. Thorp, West Allis, Wis., assignor to The Fulton Company, West Allis, Wis., a corporation of Wisconsin
Application November 30, 1936, Serial No. 113,283
4 Claims. (Cl. 74—557)

1. A steering wheel attachment, comprising, a bracket having a lateral recess and spaced gripping portions on opposite sides of said recess formed for coaction with the inner side of the steering wheel rim, a clamping strap snugly embracing the outside and top and bottom of the rim between said gripping portions and having its ends overlapped and disposed within said recess, adjustable means coacting with said overlapped strap ends and with said bracket to pull said strap into clamping engagement with the rim and to simultaneously force said gripping portions against the rim, a journal pin secured to said bracket and projecting upwardly therefrom, and a knob rotatably supported by said pin.

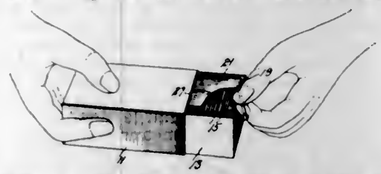


2,101,520
OSCILLATOR FOR USE WITH KINESCOPE DEFLECTING CIRCUITS
William A. Tolson, Erlton, and Justin R. Duncan, Camden, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application February 27, 1932, Serial No. 595,484
18 Claims. (Cl. 250—36)

1. An oscillator comprising an electron tube having grid and plate circuits, said grid circuit being excited from said plate circuit in such manner that as the plate current increases the bias on the grid of said tube increases in the positive sense and as the plate current decreases such bias increases in the negative sense, a condenser connected in said grid circuit for applying to the grid a potential more negative than that required for cut-off, and a resistance connected in said grid circuit and providing a dis-

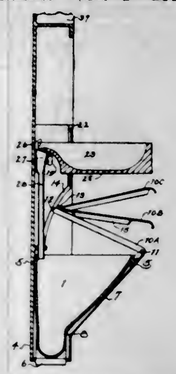
charge path for charges stored by said condenser, said electrical circuit being characterized by the fact that the respective values of said condenser and said resistance and the constants and relation of the component parts are such that a charge is stored by said condenser only once during each complete operating period and during a relatively small part of such period and which is effective to bias said grid substantially below the cut-off point.

2,101,521
TRIMMING MATERIAL
Abraham Topiel, New York, N. Y.
Application May 29, 1937, Serial No. 145,423
3 Claims. (Cl. 66—193)



1. A trimming or the like comprising a series of parallel cords, and a pair of cloth strips attached to said cords, one of said strips being essentially puckered and the other essentially smooth.

2,101,522
CARTON
Clarence W. White, North Bennington, Vt.
Application May 22, 1937, Serial No. 144,123
2 Claims. (Cl. 229—9)

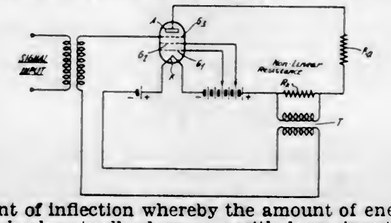


1. A carton for matches or the like including a casing, a drawer slidable therein, and a retainer strip for the drawer contents, said strip having a retaining portion provided with a tuck-in attaching flap secured to the inner face of one

end of the drawer, the remainder of said strip being free, said strip extending along the top portion of the drawer substantially from end to end and being enough shorter than the drawer

to lie within the drawer, the free end of said strip being in the same plane as the retaining portion, part of said free end being cut away from its edge inwardly.

2,101,523
TOILET FIXTURE
Richard M. Willis, Mobile, Ala.
Application December 9, 1935, Serial No. 53,654
5 Claims. (Cl. 4—169)

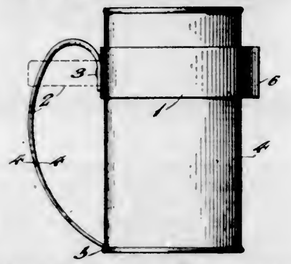


1. A water closet, the bowl portion being of flexible material and collapsible, having a seat, flushing means and a liquid seal sanitary trap with discharge means.

2,101,524
QUATERNARY AMMONIUM COMPOUNDS AND PROCESS OF PREPARING THEM
Gerhard Balle and Kurt Eisfeld, Frankfort-on-the-Main, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application June 18, 1937, Serial No. 149,028. In Germany June 24, 1931
23 Claims. (Cl. 260—106)

1. The process which comprises treating an organic basic compound having at least two tertiary nitrogen atoms with an ester of a carboxylic acid containing a reactive anion.

2,101,525
LINEAR AMPLIFIER CIRCUIT
Hans Bartels, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application December 18, 1934, Serial No. 758,044
In Germany March 21, 1934
8 Claims. (Cl. 179—171)

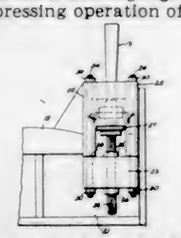


1. The method of operating a regeneratively connected thermionic device with relation to its plate current-plate voltage characteristic so as to prevent instability caused by increases in the amount of energy fed back due to increases in input energy, which consists in operating the thermionic device in a manner such that its characteristic has a distinct point of inflection within the operating range and adjusting the thermionic device so as to operate about this

point of inflection whereby the amount of energy fed back actually decreases with large inputs.

2. In a circuit including an electronic tube provided with an anode, a cathode and a control electrode, means for assuring saturation discharge effects in the operation of the cathode comprising a pair of auxiliary grids interposed between the cathode and the control grid and means for maintaining said auxiliary grids at fixed positive potentials with respect to the cathode.

2,101,526
RECEPTACLE HOLDER
Willard G. Bryant, Miami, Fla.
Application September 29, 1936, Serial No. 103,117
1 Claim. (Cl. 16—114)

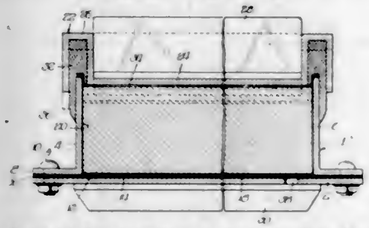


A receptacle holder comprising a spring curvilinear handle, the bottom edge of which is adapted to engage the bead on the bottom end of a receptacle, and an annular split spring band secured to the upper end of said handle, the ends of said band being outwardly turned and spaced apart a distance well below the diameter of the receptacle to be held, whereby the pressure of the receptacle against said ends tends to open said spring band and cause the latter to encircle said receptacle.

2,101,527
PRESS
Arthur A. Byerlein, Detroit, Mich., assignor to General Machinery Corporation, Hamilton, Ohio, a corporation of Delaware
Application December 5, 1934, Serial No. 756,107
5 Claims. (Cl. 113—38)

1. In a press of the character described, a frame, a slide reciprocably operable in said frame, means for operating said slide in one direction for a pressure operation including a pressure link, said slide comprising a main body having a surface facing generally in said direction and also having a separate lug to which said link

is connected, and means acting under initial tension effective to normally force said lug toward said surface to hold said lug rigidly to said main body during pressing operation of the press with-



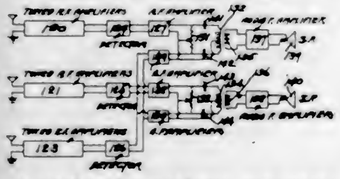
in a predetermined safe working capacity of the slide and its operating means, but adapted to stretch and provide for relative movement of said lug away from said surface of the body when an overload is imposed.

2,101,528

MEANS FOR TREATING LIQUID CONTAINING COMPRESSIBLE BODIES OF MATERIAL

John R. Bjorklund, Chicago, Ill., assignor to Northwestern Terra Cotta Corp., Chicago, Ill., a corporation of Illinois

Application November 18, 1935, Serial No. 50,335
4 Claims. (Cl. 25—45)



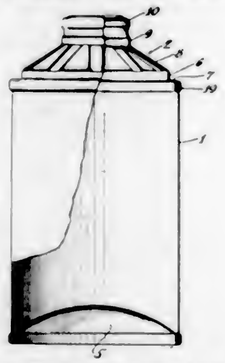
1. A mold for treating a compressible body of material containing a liquid, comprising a base having walls for receiving and holding said body of material, said base being provided with at least one opening and a filter bed communicating therewith between said base and body of material, a closure member movable with respect to said base and having a marginal channel adapted to receive said walls, and flexible sealing means between said walls and channel to provide a fluid-tight joint therebetween.

2,101,529

RADIO TRANSMISSION AND RECEPTION

Harry B. Breedlove, Memphis, Tenn.

Application September 25, 1935, Serial No. 41,986
11 Claims. (Cl. 250—10)



1. In a receiver for intensity modulated radio frequency currents and which employs tuning and amplifying means, dual detectors, each having an output transformer, two pairs of electron discharge devices, a third transformer, having its primary inverted with relation to the primary of one said output transformer; and an amplifier and speaker connected to the secondary of said third transformer; means connecting opposite ends of the secondary of a first said output transformer respectively each to the grid of a first said electron discharge device of each said pair of said devices, means connecting opposite ends of the secondary of the second said output transformer respectively each to the grid of the second said electron discharge devices of each said pair of said devices, means connecting both plates of a first said pair of said devices and both plates of the second said pair of said devices respectively to opposite ends of the primary of said third transformer, interconnected taps connecting the secondaries of both said output transformers to the cathodes of said electron devices, and a tap connecting the primary of said third transformer to said cathodes.

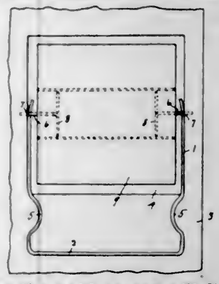
2,101,530

SHEET-MATERIAL CONTAINER AND ART OF MAKING SAME

Julius Brenzinger, Fairfield, Conn.

Application May 5, 1936, Serial No. 77,938
3 Claims. (Cl. 113—121)

1. The method of uniting the body and top of a container which consists in: providing the body at one of its ends with an outwardly extending flange; providing the top at one end with a dependent rim of smaller diameter than that of said body and with an outwardly extending flange that projects from the lower part of said rim and is of a diameter greater than that of the outwardly extending flange of the body; supporting the body and limiting its endwise movement; positioning the top on the end of the body with the outwardly extending flanges of the body and top in contact; clamping the inner and outer surfaces of the flange of the top in a plane within the outer circumference of the body; and seaming the flanges of the body and top together.



2,101,531

TOILET PAPER HOLDER

Earle P. Clemson, Baltimore, Md.

Application March 6, 1937, Serial No. 129,374
2 Claims. (Cl. 242—55.2)

2. A toilet paper holder comprising a frame formed of spring material having two free ends normally apart, an arm on each of said free ends having one end projecting inwardly and adapted to hold a roll of paper and its opposite end projecting outwardly and adapted to fit in an aperture in opposite sides of a recess in a wall to hold the frame and roll of paper in said recess, the said frame being bent so that the portion

thereof below the said recess will lie against the outer wall when the roll of paper is secured in said recess.

2,101,532

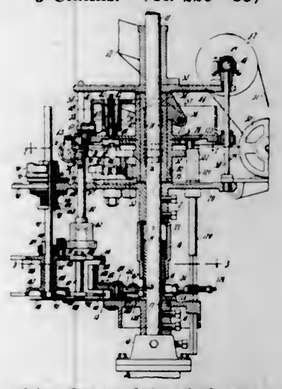
TEXTILE LUBRICATION

Victor Conquest, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application June 29, 1936, Serial No. 88,065
15 Claims. (Cl. 91—68)

1. A textile thread carrying an adsorbed film of a ketonic material having the general formula

$$R-\overset{\overset{O}{\|}}{C}-R'$$



wherein R is a closed ring radical and R′ is an alkyl radical containing at least six carbon atoms.

2,101,533

FOIL CAPPING MACHINE

Robert N. Cundall, Lackawanna, and Howard E. Gantzer, Kenmore, N. Y., assignors to Consolidated Packaging Machinery Corporation, Buffalo, N. Y., a corporation of New York

Application April 24, 1935, Serial No. 17,952
3 Claims. (Cl. 226—85)

1. A machine for applying foil caps to the necks of containers comprising, a resilient, fluid-pressure operated, cup-shaped member adapted to envelop the neck of the container, means to lower said member over the neck of a container positioned therebeneath and to elevate said member, a pump associated therewith, means to operate said pump to apply uniform pressure to the external surface of said member when lowered and to release the pressure before said member is elevated, said member and said pump being rigidly connected to move as a unit.

2,101,534

UREA-FORMALDEHYDE CONDENSATION PRODUCTS

Donald Edwards Edgar, Philadelphia, Pa., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 1, 1935, Serial No. 34,300
1 Claim. (Cl. 260—3)

In the manufacture of urea-formaldehyde reaction products the steps which comprise reacting the urea and formaldehyde in aqueous solution thereby obtaining in caked form a crystalline precipitate of said reaction product in aqueous liquor which is a non-solvent for the precipitated reaction product, separating substantially all said aqueous liquor from the crystalline caked precipitate, breaking the resulting cake into small pieces, then forming a slurry of said precipitate with a water miscible liquid which is selected from the class consisting of acetone and alcohols and which is a non-solvent for said precipitate, separating said precipitate from the non-solvent, and completely drying the precipitate thereby obtaining said urea-formaldehyde reaction product in a fluffy form substantially free from lumps and caked particles.

2,101,535

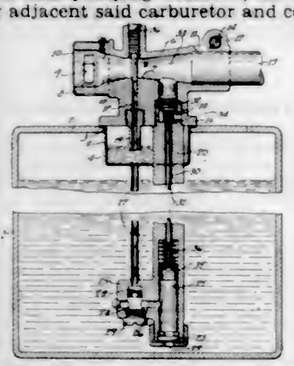
REVERSIBLE PROPELLER

Seth Mauritz Fingal Engdahl, Stockholm, Sweden

Application July 11, 1936, Serial No. 90,117
In Sweden July 12, 1935
4 Claims. (Cl. 170—159)

1. A reversible screw propeller of the character described, comprising a hub and a plurality of blades, each blade having a transversely tapered profile, the blades being arranged in two groups, each group having its blades uniformly spaced and disposed with their tapered edges turned in a direction opposite to the tapered edges of the other group, in such a manner that rotation of the propeller in one direction will bring one group of blades into effective operation and rotation of the propeller in the opposite direction will bring the other group of blades into effective operation.

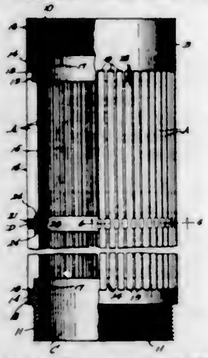
2,101,536



FUEL FEED MEANS

George R. Ericson, St. Louis, Mo., assignor to Carter Carburetor Corporation, St. Louis, Mo., a corporation of Delaware

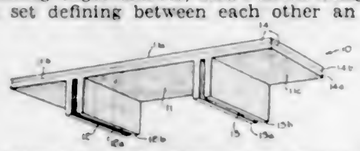
Application August 19, 1936, Serial No. 96,791
4 Claims. (Cl. 261—36)



4. In combination, a carburetor for support on a fuel tank and having an induction passage, tubular structure projecting from said carburetor for insertion into the tank, a plunger extending loosely through said structure and exposed at one end to pressure pulsation in said carburetor, said tubular structure having a pumping chamber at its opposite end with a check controlled inlet, an outlet valve seat spaced from said inlet, a collar loosely surrounding said plunger and cooperable with said outlet seat to substantially re-

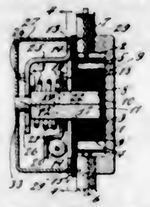
sist passage of fuel through said seat except outwardly of said pumping chamber, an over-flow chamber adjacent said carburetor and communi-

cating with said pumping chamber through said tubular member, and a suction fuel feed communication between said over-flow chamber and said induction passage.



2,101,537
WELL SCREEN
Elmer D. Every, Rochelle Park, N. J.
Application March 16, 1937, Serial No. 131,194
5 Claims. (Cl. 166—5)

1. A fabricated well screen, including upper and lower cylindrical end members, and a plurality of vertical bars circumferentially spaced with reference to the end members and secured at their opposite ends thereto, said bars having inwardly converging side faces defining between adjacent bars water passages which flare towards the interior of the screen and which have their major dimension disposed vertically, and a reinforcing band of a thickness coinciding with the thickness of the bars and located intermediate the length of the bars, said band and bars having corresponding interengaging notched portions, which notched portions are of such a combined depth as to dispose the inner and outer surfaces of the bars and band in flush relation.

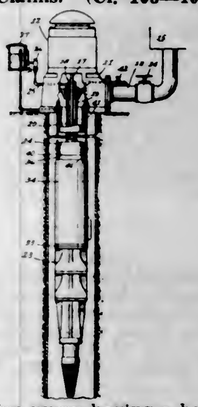


2,101,538
FLOOR CONSTRUCTION
Herbert Alfred Faber, Cincinnati, Ohio
Application March 14, 1936, Serial No. 68,789
17 Claims. (Cl. 72—68)

1. In a floor construction, a block pre-shaped to include a plane flooring surface, sets of parallel spacially related flanges depending from the under-side of said flooring surface, each of the said sets of flanges completely crossing the said under surface between two oppositely related edges thereof and being spaced apart from the remaining edges thereof, said related flanges of each set defining between each other an open

slot having a mean width substantially commensurate with the mean thickness of an individual flange, and a mean depth substantially equal to the outward extension of the flanges, the width of said slot being small as compared to the distance between any two mutually adjacent sets of related flanges.

2,101,539
ELECTRIC SWITCH
Joseph Figueira, New York, N. Y., assignor to Leviton Manufacturing Company, Brooklyn, N. Y., a corporation of New York
Application October 8, 1934, Serial No. 747,297
4 Claims. (Cl. 200—64)

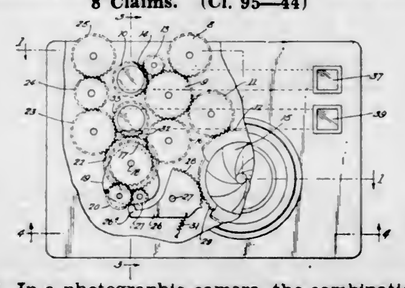


1. In an electric switch, a base, a revoluble make and break device in said base, an axially extending shaft for operating said make and break device, a metal plate through which said shaft passes attached to said base, a struck up tongue from said plate having a journal for said shaft, and mechanism for operating said shaft, said shaft operating mechanism being located between said plate and tongue.

2,101,540
PROCESS FOR PRODUCING ARTICLES FROM MOLDABLE POWDER
Kurt Gullich, Marienberg in Saxony, Germany, assignor to Bisonit G. m. b. H., Marienberg in Saxony, Germany
Application May 8, 1935, Serial No. 20,498
In Germany May 8, 1934
3 Claims. (Cl. 18—61)

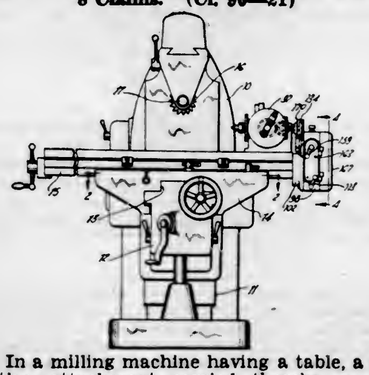
1. Process for manufacturing pre-molded articles patterned right through in various colors, from a powder of a product which is moldable under heat, such as horn flour, which comprises only partially filling a mold cavity with a quantity of the moldable powder to form a continuous layer of the same on the bottom of the mold; shaping the upper surface of, and compressing, the layer, unheated, by means of a profiled die; applying to the resulting profiled surface of the compressed partial filling of powder another layer of the moldable powder having a different color than the first partial filling; shaping the upper surface of, and compressing, the second layer, unheated, by means of a profiled die, to produce a second compressed layer having a different color and a different cross-section than the previous layer; introducing in the same manner at least one other layer of the moldable distinctively colored powder; and finally uniting the so-placed portions of moldable powders by the simultaneous application of pressure and moderate heat whereby to form a pre-molded coherent shaped article.

2,101,541
LUBRICATING SYSTEM FOR VERTICAL PUMP SHAFTS
James M. Hait, Los Angeles, Calif., assignor to Food Machinery Corporation, a corporation of Delaware
Application April 29, 1935, Serial No. 18,820
24 Claims. (Cl. 103—102)



1. In a turbine pump having a bowl assembly, a line shaft extending through said bowl assembly, a tubing enclosing said line shaft, and a delivery pipe enclosing said tubing, the combination of: by-pass means interposed between the interior of said tubing and the exterior of said pipe at a point above said bowl assembly; an elongated housing surrounding said pipe and enclosing the outlet of said by-pass, said housing having an outlet opening at its lower end portion; a liquid return conduit connecting the top portion of said housing with the surface of the ground; and means for applying pressure within said housing to force the liquid therein through said return conduit to the surface of the ground.

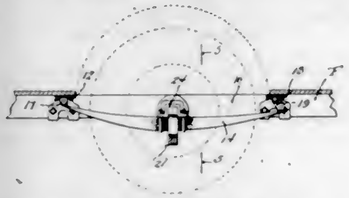
2,101,542
METHOD OF COMPRESSING WOOD
Robert N. Hartzell, Piqua, Ohio, assignor to Hartzell Industries, Inc., Piqua, Ohio, a corporation of Delaware
Application August 2, 1935, Serial No. 34,377
1 Claim. (Cl. 144—309)



The method of making a laminated propeller comprising forming strips of wood of tapering thickness, heating and compressing the strips to produce graduated degrees of compression with the greatest degree at the thicker portions of the strips, the heating and compression to which the strips are subjected being carried out at a temperature of about 300° F., at a time of about a minute and a half and a maximum pressure of about 700 pounds per square inch, so as to permanently compress the fibers progressively to various degrees at various points along the length of each strip while maintaining the strength of the fibers, and gluing the strips together to form a propeller blade with the denser portions of the blade being used for the hub portion.

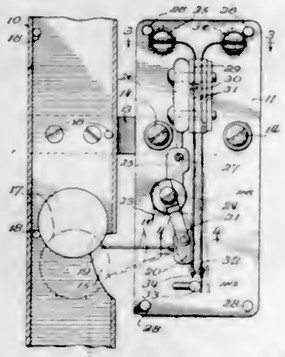
2,101,543
PHOTOGRAPHIC CAMERA
Gerhard Henkel, Dresden, Germany, assignor to Zeiss Ikon Aktiengesellschaft, Dresden, Germany
Application April 30, 1936, Serial No. 77,161
8 Claims. (Cl. 95—44)

1. In a photographic camera, the combination, a photographic lens, means for adjusting said photographic lens, a diaphragm for said lens, means for adjusting said diaphragm, a range finder, manually operable means for actuating both said adjusting means and range finder simultaneously, a second range finder operatively connected with said diaphragm adjusting means and a second manually operable means for actuating said second range finder and said diaphragm adjusting means simultaneously, without changing the adjustment of said first range finder and said photographic lens.



2,101,544
MILLING MACHINE TRANSMISSION AND CONTROL MECHANISM
Herman R. Isler, Norwood, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Application March 26, 1936, Serial No. 70,991
8 Claims. (Cl. 90—21)

1. In a milling machine having a table, a work rotating attachment carried thereby, a drive

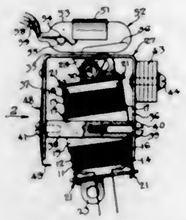


shaft and a lead screw supported by the table, the combination of means for actuating the attachment and lead screw including a bracket detachably connected to the table, a pair of gears carried by the bracket, a gear train connecting the gears for simultaneous rotation in opposite directions by the drive shaft, reduction gearing connecting one of said gears to said lead screw, and means to selectively connect either of said gears for actuation of the attachment.

2,101,545
SPRING SUSPENSION FOR TRAILERS
Thomas H. Jacob, Wausau, Wis.
Application October 22, 1936, Serial No. 107,011
2 Claims. (Cl. 280—106.5)

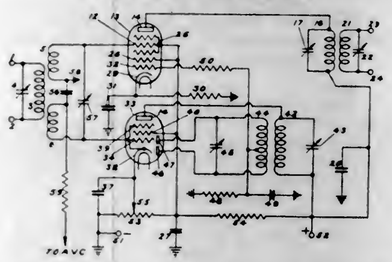
1. In a spring suspension for trailers and the like, a frame including inner and outer spaced longitudinally extending sills, front and rear brackets rigidly connecting said sills, a substantially U-shaped axle extending transversely across the frame having outwardly extending stub ends arranged between the sills and the front and rear brackets, leaf springs extending under said stub ends, means securing the ends of the springs to the under face of the brackets, and means rigidly connecting the springs with the stub axle ends.

2,101,546
COIN ACTUATED SWITCH
Carl G. Johnson, Chicago, Ill., assignor to J. P. Seeburg Corporation, Chicago, Ill., a corporation of Illinois
Application March 10, 1937, Serial No. 130,026
2 Claims. (Cl. 194—9)



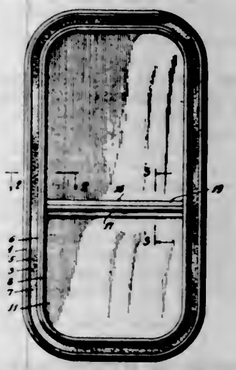
2. In combination, a coin chute, having an arcuate opening at one side, a switch housing comprising a base and a cover of insulating material, said cover being provided with an opening, means mounting said base on said chute with last said opening adjacent said arcuate opening, a pair of resilient blades mounted on said base, terminals on said base connected to said blades, an elongated block of insulating material pivotally mounted within the housing and having an elongated face on both sides of its pivotal axis, one of said blades being biased towards said elongated face, the other blade being biased towards the first said blade, an abutment against which said other blade bears resiliently, said abutment holding said other blade out of contact with the first said blade when the first said blade bears against said elongated face, an arm rigidly mounted on said block extending through the opening in the cover and having a laterally turned end portion located within said arcuate opening in the path of a coin passing through the chute, whereby the block is oscillated by a passing coin and the first said blade is displaced into contact with the other blade, the first said blade effecting by its resilience the return of the block and arm to initial position.

2,101,547
PROCESS OF CURING HAMS
John C. Kistler, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application March 15, 1937, Serial No. 131,110
4 Claims. (Cl. 99—159)



1. The process of curing hams which comprises the steps of first partially curing the hams with a salt-curing composition, then immersing the hams in hot water maintained at a temperature of about 60° to 75° C. for a period of time of about four to six hours, and then smoking the hams in the usual way.

2,101,548
ELECTROMAGNETIC APPARATUS
Carl G. Kronmiller, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application May 28, 1936, Serial No. 82,217
15 Claims. (Cl. 200—112)

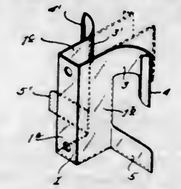


1. In combination, a winding having a passage therethrough, means for mounting said winding with said passage horizontally disposed, a rigid U-shaped member having its base portion pivotally mounted above but close to said winding with its legs extending downwardly, a core comprising magnetic material extending through said passage and secured to the legs of said U-shaped member, means biasing said member to a position wherein the magnetic center of said core is displaced from the center of said winding, said winding being effective upon energization thereof to move said core and said member so as to cause the magnetic center of said core to approach the center of said winding, and means actuated by said member when so moved.

2,101,549
SILENCING CIRCUITS FOR RADIO RECEIVERS
James J. Lamb, West Hartford, Conn., assignor, by mesne assignments, to Alan N. Mann, Scarsdale, N. Y., trustee
Application April 18, 1935, Serial No. 16,961
25 Claims. (Cl. 250—20)

5. In the intermediate frequency amplifier of a superheterodyne receiver two parallel paths: the first, a screen grid thermionic amplifier including an input circuit, an output circuit, and a control grid electrode; the second, a screen grid thermionic amplifier, including an input circuit, an output circuit, and a rectifier coupled to the last mentioned output circuit; means connected in the second path to prevent its operation for signal representing voltages; means connected in the rectifier circuit to derive pulsating voltages from rectified currents; and a series connected impedance connection from said rectifier to said control grid electrode so that static representing voltages exceeding said signal voltages are attenuated in said first path.

2,101,550
SHIP DOOR OR HATCH CONSTRUCTION
Albert L. Lambert and Francis M. Lambert, Narberth, Pa., assignors to Heintz Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application April 2, 1936, Serial No. 72,297
6 Claims. (Cl. 114—117)

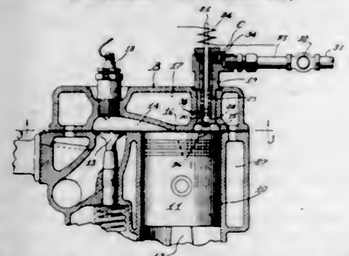


1. A light weight ship door or hatch comprising an aluminum panel and extruded aluminum members, the ends of which are butt welded together to form a frame extending continuously around said panel, said frame being welded to said panel and having a stiffening wall portion extending at right angles to the plane of said panel.

2,101,551
CLIP
Reginald E. Marsh, Bronxville, N. Y., assignor to Simplon Products Corporation, a corporation of New York
Application October 16, 1934, Serial No. 748,435
3 Claims. (Cl. 189—35)

3. A clip for securing two angularly disposed trough-shaped members together comprising a piece of sheet metal shaped to form an end wall and two side walls, one extending from each edge of the end wall and each side wall having an extension of substantial length extending outwardly of the side wall and united to the wall adjacent one end and otherwise disconnected from the wall and extending substantially parallel to the axis of the slot formed by the end and side walls, the disconnected portion of the extensions and the edge of the wall forming slots to receive the flange of a trough-shaped member and the side walls diverging from the end wall whereby the clip may be adjusted to variations in the trough-shaped members.

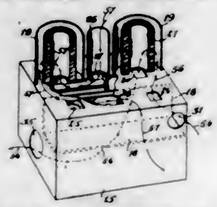
2,101,552
CLIP
Reginald E. Marsh, Bronxville, N. Y., assignor to Simplon Products Corporation, a corporation of New York
Application March 13, 1937, Serial No. 130,674
3 Claims. (Cl. 189—35)



2. A furring clip for securing a channel-shaped furring strip to another furring strip angularly disposed with respect thereto comprising a piece of sheet metal shaped to form an end wall and two side walls, one extending from each edge of the end wall, each side wall having a curved section of lesser width than the side wall extending from the side wall, and an extension of substantial length parallel to the edge of the side wall on the end of the curved extension.

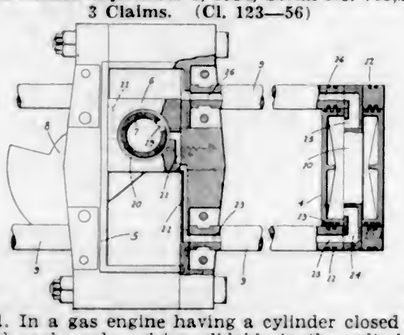
2,101,553
COATING IRON OR STEEL WITH ALUMINUM OR AN ALLOY THEREOF
Ernst Johan Mauritz Mattsson, Stockholm, Sweden, assignor to Frans Nilsson, Stockholm, Sweden
No Drawing. Application February 28, 1935, Serial No. 8,722. In Great Britain March 5, 1934
5 Claims. (Cl. 91—70.2)

2. A method of aluminizing the surface of a ferrous metal body which comprises cleaning and heating the body by immersing the same in a molten flux bath of the salt type the active ingredients of which consists of alkali metal fluoride and chloride selected from the chlorides of



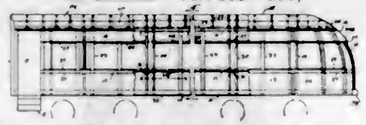
one or more of the metals of the group consisting of the alkali metals and zinc but free from any salt of calcium, removing the body from said bath and immersing the body in a molten bath containing aluminum.

2,101,554
INTERNAL COMBUSTION ENGINE AND INJECTING DEVICE THEREFOR
Andre J. Meyer, Grosse Pointe Village, Mich., assignor to Continental Motors Corporation, Detroit, Mich., a corporation of Virginia
Application September 28, 1933, Serial No. 691,271
4 Claims. (Cl. 123—25)



3. In an internal combustion engine, a cylinder and a cylinder head structure cooperating therewith to provide a combustion chamber having primary and secondary combustion chamber portions and a restricted zone located intermediate said portions, a spark plug for the primary combustion chamber portion, electrically controlled means for injecting a cooling liquid into the secondary combustion chamber portion which contains the fuel charge last to burn under the influence of said spark plug, and means for energizing said spark plug and said injecting means substantially simultaneously.

2,101,555
AIR OR GAS CONDITIONING APPARATUS
William E. Moore, Pittsburgh, and George L. Simpson, Coraopolis, Pa., assignors to Pittsburgh Research Corporation, Pittsburgh, Pa.
Application July 11, 1935, Serial No. 30,908
14 Claims. (Cl. 183—4)

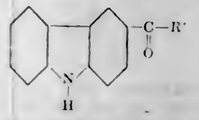


3. In an adsorbent apparatus, a casing separated into two chambers and having a pair of ports spaced a substantial distance apart, each of said ports communicating with one of the casing chambers, a tower secured to said casing and surrounding both of said ports, a tubular body of solid adsorbent material arranged in said tower in spaced relation to the walls of the tower, said tubular body extending from top to bottom of said tower and surrounding one of said ports, the other of said ports being in communication with the space surrounding the tubular body of adsorbent, means to pass a gaseous material from one of the casing chambers through the ports and body of adsorbent material to the other chamber, a heating device, and means to pass a gaseous material from said heating device through the ports and adsorbent material while out of contact with the gaseous material in the casing chambers.

2,101,556
AIRPLANE ENGINE
Wayne N. Morgan, Merced, Calif.
Application September 8, 1934, Serial No. 743,257
3 Claims. (Cl. 123—56)

1. In a gas engine having a cylinder closed at both ends and a piston slidable in the cylinder, rods parallel to the piston disposed in contact with and secured to the peripheral face thereof at diametrally opposed points, and guide elements in the cylinder about the rods, said elements and the cylinder walls following the contour of and engaging the piston and rods throughout the non-contacting areas of the latter.

2,101,557
LIGHTWEIGHT RAILWAY CAR
William H. Mussey and Martin P. Blomberg, Chicago, Ill., assignors to Pullman-Standard Car Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application June 17, 1933, Serial No. 676,265
11 Claims. (Cl. 105—397)



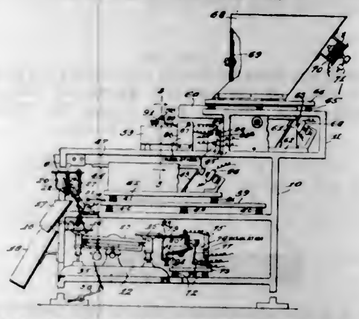
1. In a railway car framing, a side wall structure including a girder having a relatively heavy top chord member, a relatively light bottom chord member, a plate uniting said members having the major part of its area in tension, a roof framing member complementing said top chord to form therewith a side plate longitudinal in the framing assembly and having spaced inner and outer flanges projecting upwardly from the margins of said plate, transversely extending framing members supported upon said plates with their ends between said flanges, and a roof plate connecting said transverse members and side plate.

2,101,558
PROCESSING OF HYDROCARBON RESINS
Thomas F. Nealon, Boston, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Application July 8, 1936,
Serial No. 89,662
6 Claims. (Cl. 260—2)

1. In the manufacture of hydrocarbon resins by polymerization of a cracked hydrocarbon distillate rich in unsaturates including diolefines, by means of a metallic halide polymerizing catalyst, the steps in the recovery of the resin characterized in that the catalyst is neutralized and thereby destroyed by means of an excess of caustic alkali, after which the mixture is acidified by the addition of an acid whose alkali metal salt is insoluble in the hydrocarbon mixture and subsequently removing the excess acid by the addition of alkali metal carbonate.

2,101,559
CARBAZOLE-ALKYL KETONES
Anderson W. Ralston and Carl W. Christensen, Chicago, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application September 19, 1936,
Serial No. 101,675
5 Claims. (Cl. 260—46)

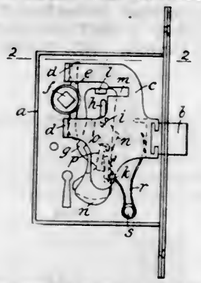
1. An aralkyl ketone having the structure:



wherein R′ is an alkyl radical chosen from the group consisting of undecyl, tridecyl, pentadecyl and heptadecyl.

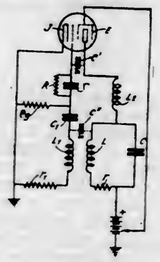
2,101,560
MIXED THIENYL-ALKYL KETONES
Anderson W. Ralston, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application October 8, 1936,
Serial No. 104,704
5 Claims. (Cl. 260—53)

1. An aralkyl ketone having the formula



wherein R is a thienyl radical and R′ is an alkyl radical having from eleven to seventeen carbon atoms.

2,101,561
AUTOMATIC WEIGHING AND PACKAGING MACHINE
Theodore Rapp, Los Angeles, Calif.
Application November 22, 1935, Serial No. 51,000
15 Claims. (Cl. 249—2)



1. In a weighing and packaging machine, a hopper, means for imparting vibratory movement to said hopper, a trough into which the contents of the hopper discharge, means for imparting vibratory movement to said trough, a hopper that receives the product from the discharge end of said trough and a plate mounted for swinging movement in said last mentioned hopper, which plate is moved in one direction as a result of over-accumulation of the product discharged into said hopper from said trough.

2,101,562
LOCK
Edward Robins, Farnham, England
Application March 17, 1936, Serial No. 69,306
In Great Britain March 19, 1935
1 Claim. (Cl. 70—150)

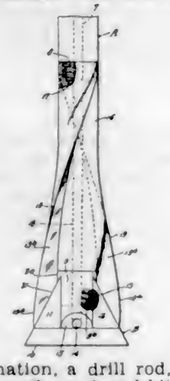
A lock comprising a casing, a roll back in said casing, a slidable plate in said casing having studs for operative engagement with said roll back, a latch bolt secured to said plate, a key-operated locking member arranged behind the plate and operative in one position to prevent the plate and bolt from being retracted, pins in the casing whereby said locking member is guided at right angles to the movement of the plate, a tumbler arranged between the plate and locking member and pivoted to one of said pins, a stud on the locking member adapted to co-operate with said tumbler for holding the locking member both in operative and inoperative position, a shoulder on the plate, and a spring arranged between said shoulder and tumbler for controlling both the plate and the tumbler.

2,101,563
TRIODE OSCILLATOR AND THE LIKE
Yves Rocard, Paris, France, assignor to Compagnie Generale de Telegraphie Sans Fil, a corporation of France
Application March 20, 1935, Serial No. 11,905
In France March 22, 1934
5 Claims. (Cl. 250—36)

1. Oscillating circuit comprising a thermionic tube having a cathode, grid and plate, a tuned circuit in the plate circuit of the said tube, coupling means between this tuned circuit and the grid circuit of the tube, and means for stabilizing

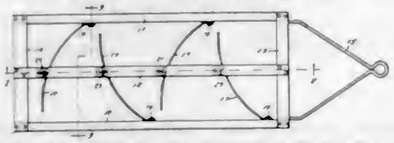
the oscillating frequency, said means comprising an impedance inserted in series in the grid circuit between the oscillating grid of the tube and the said coupling means, this impedance being determined so that the alternating tension on the grid during oscillation has the same phase as if the grid impedance were infinite, and a second impedance inserted between the plate of the tube and the tuned circuit, this second impedance being determined so as the oscillation frequency is independent of the internal impedances of the tube.

2,101,564
HOUSE COAT
Elias Sayour, Brooklyn, N. Y.
Application May 5, 1937, Serial No. 140,811
2 Claims. (Cl. 2—93)



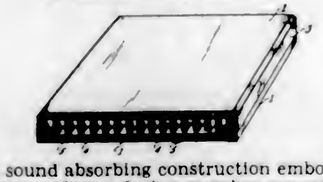
1. A house coat comprising a back member, a pair of front members and a pair of sleeve members, said back member being formed with a skirt section tapering from the bottom to the waistline and a body section merging at its center into the top of said skirt section, said body section adjacent the waistline having side portions projecting laterally beyond the skirt section, and a pleat formed in the body section adjacent each junction of the skirt section and said side portions, said pleats forming continuations of said skirt section whereby the top of the skirt section appears to overlap the body section.

2,101,565
CAN MARKING AND DISPLAYING DEVICE
Nicholas Snelling, Jackson Heights, Long Island, N. Y.
Application December 7, 1936, Serial No. 114,618
9 Claims. (Cl. 40—7)



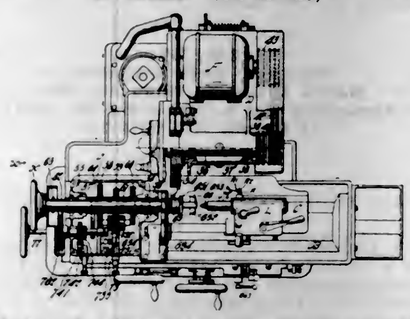
7. A device for marking or characterizing articles of merchandise comprising a normally flat sheet of material fashioned to form a display or marking section and a mounting part, said mounting part being cut out to form spaced apertures with the body of said mounting part cut intermediate said apertures on a line arranged centrally of said spaced apertures to form opposed coupling tongues, adjacent edges of which are arranged in close proximity to each other, and said tongues being capable of independent flexure in mounting the device in connection with a suitable support engaged by said tongues to retain the device against displacement from said support.

2,101,566
NONFOULING DRILL
Wade Vanderpool, Stevenson, Wash., assignor of one-half to Dee Wakefield, Stevenson, Wash.
Application January 28, 1937, Serial No. 122,863
7 Claims. (Cl. 255—69)



1. In combination, a drill rod, a drill bit, coacting means on the rod and bit for detachably coupling them together, said drill rod carrying spiral fins formed with wings which overlap a portion of the drill bit when the rod and bit are coupled together to prevent fouling of the bit.

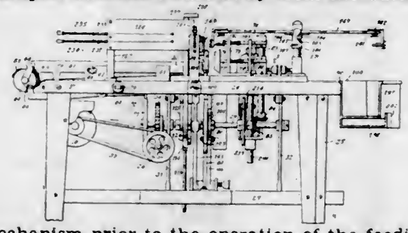
2,101,567
DRAG
Roy J. Winsor, Marion, Ohio
Application May 4, 1936, Serial No. 77,769
4 Claims. (Cl. 37—148)



1. A drag comprising, in combination, a framework, a plurality of curved blades carried thereby, alternate blades being reversely positioned and each blade being positioned with respect to said framework to present a gradually increasing angle with the direction of motion of the drag from its forward end to its rearward end each blade overlapping adjacent blades substantially its entire length, and supporting means for said blades extending therebelow.

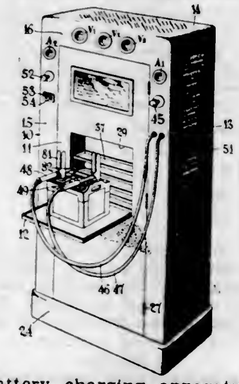
2,101,568
SOUND DEADENING CONSTRUCTION
Francis R. Woodbury, Portland, Oreg.
Application June 4, 1934, Serial No. 728,858
4 Claims. (Cl. 154—44)

1. A sound absorbing construction embodying a backing member, a facing member spaced therefrom, spacers along their edges securing backing and facing members in spaced relationship, said facing member, backing member and spacers being of a sound absorbent material, elongated ribs projecting from the inner side of the facing member into the space between the facing member and the backing member, and the thickness of said facing member permitting high frequency sound to penetrate into the space between it and the backing to be absorbed by said ribs, backing member and spacers, and the structure of the facing member providing it with a vibratorily absorbent response to sound in the lower frequencies.



2,101,569
SURFACE FORMING MACHINE
John Y. Blazek, Maple Heights, and Russell G. Anderson, Cleveland, Ohio, assignors to Lempco Products, Inc., Bedford, Ohio
Application January 20, 1934, Serial No. 707,488
28 Claims. (Cl. 29—28)

6. A surface forming machine having a bed, a table movable reciprocatingly on said bed, and a reciprocating means for said table having a driving shaft and contact elements on said table, a shaft in geared engagement with said table to move the latter, opposing bevel gears each rotatable on said driving shaft, a clutch on said shaft between and engageable with both of said bevel gears individually, a stub journaled in said bed, a reversing lever journaled on the other end of said stub, a sector on and rotatable with said stub, a contact pin projecting inwardly from said reversing lever and transversely of said sector, a spring at each side of said reversing lever, one end of each of said springs being hooked onto said contact pin, the other end of each of said springs being hooked onto said sector, a holding pin driven into said sector at each side of said reversing lever, a pair of dogs each having one end thereof pivoted on a fixed pin, one at each side of said reversing lever and the other ends thereof to engage and disengage said contact pin, and a notch in each of said dogs to engage said holding pins to lock the table reversing means until released by movement of said table.

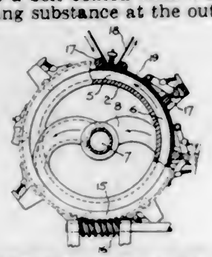


2,101,570
CONFECTION MAKING MACHINE
Emerson A. Bolen, Morris, Ill., assignor, by mesne assignments, to Fred L. Borchert, Rockford, Ill.
Application November 26, 1934, Serial No. 754,731
22 Claims. (Cl. 107—21)

1. A confection making machine comprising in combination, bar cutting mechanism, means for feeding a slab of confection material to said cutting mechanism for the severance of bars therefrom, means for inserting sticks into said slab in the areas comprising the bars, prior to the severance of the bars from the slab, means for transporting the bars by the sticks away from the cutting mechanism and means for intermittently operating the transporting mechanism to transport successive bars away from the cutting

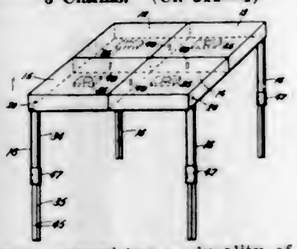
mechanism prior to the operation of the feeding mechanism and subsequent to the operation of the cutting mechanism.

2,101,571
BATTERY CHARGING AND TESTING APPARATUS
Edgar W. Breisch, Lancaster, N. Y.
Application February 12, 1934, Serial No. 710,967
2 Claims. (Cl. 312—166)



1. In battery charging apparatus, a cabinet having a door opening in the front wall thereof and an outwardly offset panel on the rear wall thereof, a hinged closure for the door opening, a plurality of battery supporting shelves in said cabinet extending across the interior thereof and spaced from said outwardly offset panel, a pair of vertical partitions extending between the uppermost one of said shelves and the top wall of the cabinet and between the front and rear walls of the cabinet to provide compartments for battery charging apparatus, and ventilating openings for the interior of the cabinet formed in the side and top walls of the cabinet, other ventilating openings for said compartments formed in said side and top walls, and the upper edge of said outwardly offset panel being spaced from the adjacent rear wall portion of the cabinet to provide a ventilating opening adjacent the top of the cabinet.

2,101,572
MINERAL SEPARATOR
John Broatch, Vancouver, British Columbia, Canada
Application December 20, 1934, Serial No. 758,523
2 Claims. (Cl. 209—49)

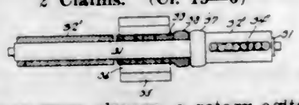


1. A metallic mineral recovery device comprising a drum having on its outer periphery a spiral duct having an inlet and an outlet, an

outer cover for the drum, said cover being adapted to support a belt coated with a metallic particle entrapping substance at the outer periphery

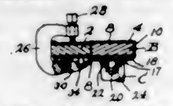
of the duct, means for rotating the drum within the cover, and means for continuously feeding the belt between the cover and the drum.

2,101,573
COLLAPSIBLE AND SEPARABLE TABLE
Walter G. Cramer and Eugene Bachelier, Cincinnati, Ohio
Application January 15, 1936, Serial No. 59,255
6 Claims. (Cl. 311—4)



1. A table comprising a plurality of separate top sections detachably secured together, and including a plurality of legs, and means for securing the legs selectively to corner locations or central locations of the separate top sections.

2,101,574
HARDENING OF PROTEINS
Charles Dangelmajer, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 12, 1935, Serial No. 16,022
6 Claims. (Cl. 91—68)

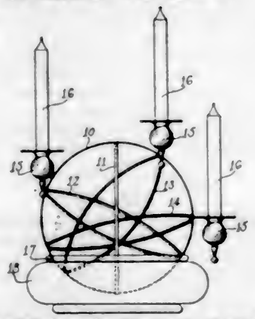


1. A process comprising coating fibrous material with a composition comprising protein, a protein hardening agent, pigment and a water soluble fatty acid amide and drying the coated material.

2,101,575
VACUUM CLEANER
Dewey M. Dow, Toledo, Ohio, assignor to Air-Way Electric Appliance Corporation, Toledo, Ohio, a corporation of Delaware
Application December 4, 1935, Serial No. 53,619
2 Claims. (Cl. 15—6)

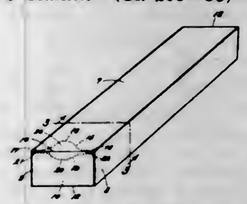
1. In a vacuum cleaner, a rotary agitator including a spindle, brushing and beating elements mounted thereon, said elements being rotatable relative to each other, and means for rotating said elements independently.

2,101,576
ADJUSTABLE LADDER LEG
Benn F. Fenton, Kansas City, Mo.
Application April 27, 1937, Serial No. 139,222
9 Claims. (Cl. 228—63)



1. A device of the character described comprising a leg adapted to be adjusted longitudinally on either rail of a ladder, a member adapted to embrace said leg and the adjacent rail and having a recess at its lower end to fit over one of the ladder rungs, and clamp means for forcing said member into frictional engagement with the leg and the rail to prevent the former from slipping upon the latter.

2,101,577
WINDOW SASH BALANCE
Martin J. Gossen, Milwaukee, Wis.
Application May 9, 1936, Serial No. 78,777
8 Claims. (Cl. 20—52)



1. In combination with a sash slidably mounted in a window frame having vertical grooves, a counterbalancing means for the sash comprising fixed slotted tubes mounted in the grooves of the opposite side portions of the frame, coiled spring lifting members positioned within the tubes and having their upper end portions secured adjacent the upper end portions of the tubes, the lower end portions of the lifting members extending through the slots and connected to the sash, and yielding means integral with the tubes and between the sash and the tubes for frictionally holding the sash in any position of adjustment.

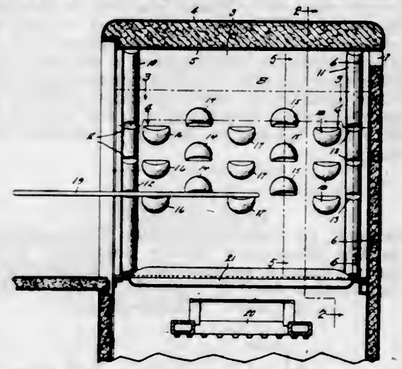
2,101,578
CANDELABRA
Tom Hall, New York, N. Y., assignor to Charles S. Robinson, Sandy Hook, Conn.
Application February 25, 1936, Serial No. 65,642
14 Claims. (Cl. 240—2)

10. A candelabra having an openwork body portion and candle sockets supported rigidly thereon in spaced relation to each other, and said body portion being provided with means to engage the upper rim portion of a container and support the candelabra therefrom with the candle sockets disposed above the container.

2,101,579
POWDER PUFF DISPENSER
Edna Hamer, Sioux Falls, S. Dak.
Application June 8, 1936, Serial No. 84,106
6 Claims. (Cl. 206—56)

1. The combination of an elongated vertical container having a bottom of relatively small area, and a front wall meeting the bottom along a corner line, said corner line being included between substantially coextensive irregular lines of perforations at opposite sides thereof, formed in the front wall and bottom of the container, the perforations defining a pinch-out portion which includes the entire corner line and wedge-shaped parts of both the bottom and front wall.

2,101,580
PROCESS FOR OBTAINING BRIGHT ZINC COATING
John A. Henricks, Chicago, Ill., assignor to Udylite Company, Detroit, Mich., a corporation of Indiana
No Drawing. Application May 2, 1936, Serial No. 77,527
10 Claims. (Cl. 204—18)



1. The method of electrodepositing zinc, comprising electrodepositing the said metal from a cyanide plating solution containing an ammonium thiocyanate formaldehyde resin which is soluble in the cyanide plating solution.

2,101,581
PROCESS FOR OBTAINING BRIGHT ZINC COATING
John A. Henricks, Chicago, Ill., assignor to Udylite Company, Detroit, Mich., a corporation of Indiana
No Drawing. Application May 2, 1936, Serial No. 77,528
13 Claims. (Cl. 204—18)

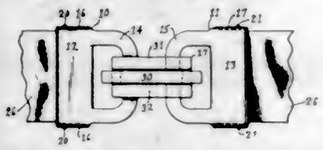
1. The method of electrodepositing zinc, comprising electrodepositing said metal from a cyanide plating solution containing a thiourea formaldehyde resin which is soluble in the cyanide plating solution.

2,101,582
OVEN LINING
John G. Hoff, Mansfield, Ohio, assignor to The Tappan Stove Company, Mansfield, Ohio, a corporation of Ohio
Application February 17, 1936, Serial No. 64,199
5 Claims. (Cl. 211—143)

1. In a device of the character described, the combination of a pair of oppositely disposed metal walls secured in rigid spaced relation and adapted to receive and to support a shelf, each of said walls having a plurality of rows of spaced projections pressed therefrom toward the opposite wall and arranged to provide a shelf support, the front and rear portions of said walls each having vertically extending stamped projecting portions also extending toward the opposite wall and having depressed portions therein

providing an additional support for said shelf and a shelf supported by said walls.

2,101,583
HAND TOOL FOR BORING, SAWING, AND RASPING WOOD AND LIKE MATERIALS
Friedrich August Hönneknövel, Remscheid-Bliedinghausen, Germany
Application December 5, 1934, Serial No. 756,037
In Germany December 13, 1933
2 Claims. (Cl. 145—117)



1. A hand tool for boring, sawing and rasping, more particularly for use in woodwork, consisting of a shank portion formed by a multi-edged rod having helically running edges and provided on all sides with saw teeth running to a point and bounded by the side surfaces of the rod and a borer, the diameter of the rod measured across the points of the saw teeth being the same over the whole length of the shank portion and being not more than the diameter of the borer.

2,101,584
METHOD FOR KILLING AND CONTROLLING ORGANISMS ON VARIOUS PLANT MATERIALS
Albert Horner, Kapaa, Kauai, Territory of Hawaii
No Drawing. Application June 22, 1934, Serial No. 731,886
3 Claims. (Cl. 21—60)

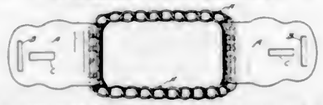
1. A method of killing mealy bugs, insects, animal organisms and fungi occurring upon

plant life and plant parts which consists in placing said parts in a closed chamber, submerging said plants in a liquid destructive to the said objectionable foreign organisms thereon and applying pressure to said liquid of a degree incompatible with the life of said organisms and thereby driving air from the interstices of the living plants by forcing the liquid into the body of the plants and thereafter suddenly releasing said pressure.

2,101,585
BELT BUCKLE
Jerome R. La Vigne, Waterbury, Conn., assignor to The Waterbury Buckle Company, Waterbury, Conn., a corporation of Connecticut
Application April 9, 1936, Serial No. 73,401
1 Claim. (Cl. 24—225)

In a belt buckle, a D-shaped open body member having a forward cross-bar, means on the rear of said member for attaching it to a belt, a raised rectangular frame connected between its ends to said cross-bar, said frame having a longitudinal aperture, one end of said frame beyond said aperture having an inclined cross-bar to facilitate the insertion of the interlocking tongue of a similar belt buckle body member and form a cam to frictionally engage said tongue.

2,101,586
SEAL
Harry Leach, Providence, R. I.
Application March 25, 1937, Serial No. 132,961
1 Claim. (Cl. 40—3)



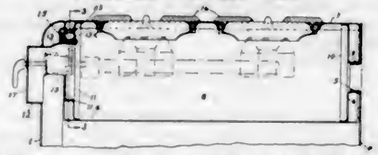
A seal comprising a strip of sheet material bent into substantially circular form, with the end portions of the strip overlapping, an offset extending completely across said strip at a point spaced from the end thereof, a slot in said offset, the other end portion of the band being of a narrowed width to be guided over the outer surface of the band between the slot and the end in entering and passing through said slot, said narrowed end portion being provided with a plurality of notches on its opposite edges to grip the end walls of said slot and secure the strip in band form.

2,101,587
INSECTICIDAL PRODUCT AND PROCESS
Arthur A. Levine and Robert W. McAllister, Niagara Falls, N. Y., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 22, 1935, Serial No. 32,588
5 Claims. (Cl. 167—22)

1. An insecticide comprising cyclohexene oxide.

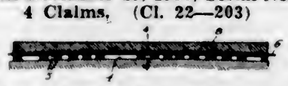
2. A mothicide and moth repellent comprising cyclohexene oxide.

2,101,588
EMERGENCY CHAIN FOR AUTOMOBILE TIRES
Herman W. Lisowitz, Uniontown, Pa.
Application January 9, 1937, Serial No. 119,793
2 Claims. (Cl. 152—14)



2. An emergency chain for automobile tires, consisting of two metallic side-plates each of which is provided with transverse and longitudinal slots one of which is adapted to receive a snap-hook or strap and the other a T-shaped connection on the ends of a strap, in combination with a continuous chain which is adapted to move laterally through the channels formed between said side-plates all substantially as shown and for the purposes described.

2,101,589
BUILDING CORNER UNIT
Robert S. Maclean, Michigan City, Ind., assignor to Mastic Asphalt Corporation, a corporation of Indiana
Application April 24, 1936, Serial No. 76,212
4 Claims. (Cl. 20—5)

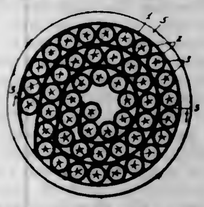


4. A rigid corner unit of the type described constructed from a rigid bent composition board, weather-proof material, coating the exterior surface of said board, reinforcing means adhering to the inside and outside of said board at said bend, said material covering said outer reinforcing means.

2,101,590
STOVE TOP
Herchael Wood Miller, Davenport, Iowa
Application April 19, 1937, Serial No. 137,706
9 Claims. (Cl. 126—214)

2. In a stove, a top section having ends and a pair of top faces, trunnions for pivotally mounting said top section, said section being rotatable about the axes of said trunnions, and the faces of said section being capable of being brought selectively approximately into the plane of the stove top.

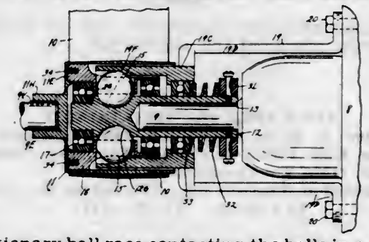
2,101,591
METHOD OF PRODUCING ELECTROTYPE PLATES
Marshall H. Muse, New York, N. Y.
Application December 19, 1936, Serial No. 116,691
4 Claims. (Cl. 22—203)



1. The method of producing electrolytic printing plates which consists in supporting the shell with its printing face in contact with a smooth convex surface, applying pressure to the back of the shell to conform its printing face to the convex surface, pouring the molten backing metal thereon while the pressure is maintained, and thereafter straightening the plate.

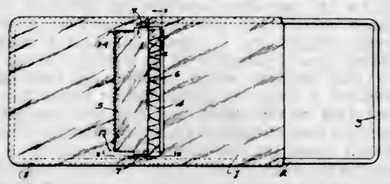
2,101,592
NOVELTY DISPLAY
Marie Y. Ogg, Lincoln Park, N. J.
Application July 17, 1936, Serial No. 91,091
1 Claim. (Cl. 40—126)

A novelty display, including a main supporting sheet like member, a second sheet like support attached thereto and having two spaced circular dots, a circular relatively thick insoluble disk having two spaced openings of a size greater than the sizes of the circular dots attached to the second sheet so that the dots are visible through the respective openings of the disk, said dots and openings simulating two eyes, the exterior of the disk being provided with other elements to simulate a face, and a tuft of fibrous material adhesively attached to the second sheet and arranged loosely about one edge of the disk to simulate the hair of the head formed by the disk.



2,101,593
CIGARETTE STUB RECEIVER AND EXTINGUISHER
Frank C. Osborn, Manchester, Vt.
Application October 12, 1935, Serial No. 44,771
1 Claim. (Cl. 131—51)

A device of the character described comprising a strip of paper, a plurality of substantially tubular pockets formed of paper and having their upper ends open and their lower ends squeezed into a point of closed formation, and means for securing said pockets in spaced relation to one surface of said strip of paper without disturbing their tubular formation, said pockets being arranged to extend from near the top to near the bottom of said strip of paper and spaced sufficiently apart to permit coiling with substantially no loss of space.

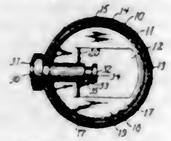


2,101,594
VARIABLE SPEED PULLEY
Otis Edward Pensbee, St. Paul, Minn., assignor of one-half to Samuel Meckler, St. Paul, Minn.
Application June 19, 1936, Serial No. 86,103
2 Claims. (Cl. 74—302)

1. A single-speed reducing device for motor drive shafts, said device comprising a stationary outer ball race member mounted on said motor concentric of its drive shaft and its ball race positioned outwardly of the end of the said drive shaft, a drive-shaft extension member with a sleeve part fixed on the drive shaft, a ball retainer rotatably carried by said extension member, a pulley carried by said ball retainer and extending over the stationary ball race member, an inner ball race at the outer part of said extension shaft and rotating in a plane outward of the stationary ball race, said ball retainer formed with a series of circularly arranged ball carrying and radially open pockets, a ball in each pocket exposed inwardly and outwardly of its pocket and contacting the said inner and outer races, said

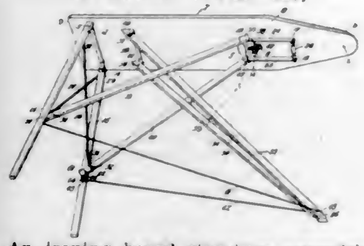
stationary ball race contacting the balls in a plane inward of the plane of ball contact of the inner race, to roll the balls simultaneously, all said balls rotatable on a common angular plane to rotate the ball carrier by friction contact on a circle intermediate the ball races within the pockets and produce a predetermined pulley speed lower than the drive shaft speed, and means for continuously and yieldably compressing the balls into traction contact with the races.

2,101,595
CORRUGATED SLICER AND DETACHABLE SHREDDING SET
George Potstada, Oakland, Calif.
Application October 29, 1934, Serial No. 750,449
6 Claims. (Cl. 146—171)



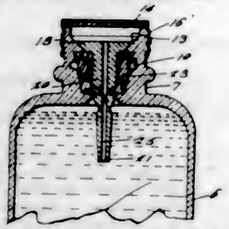
5. A device of the class described comprising a holder, an opening in the face of said holder, a slot on each side of said opening, a detachable slicing blade having a forwardly projecting cutting edge adapted to fit into said opening, bent down portions on said blade having slots opening rearwardly and adapted to hook into said first slots and to engage the edges of said first slots when the blade is moved backward and rearwardly projecting members on said blade adapted to slide under the back edge of said opening.

2,101,596
ADJUSTABLE HOLDER FOR LIPSTICKS AND THE LIKE
Howard F. Reichenbach, Waterbury, Conn., assignor to The Chase Companies, Incorporated, Waterbury, Conn., a corporation of Connecticut
Application May 1, 1936, Serial No. 77,341
3 Claims. (Cl. 206—56)



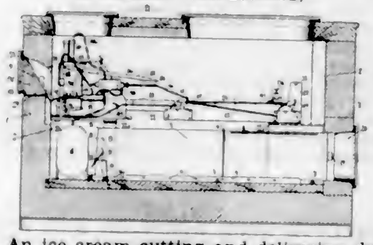
3. An adjustable holder of the class described including in combination: a hollow body having a slot therein; a carrier located in said hollow body and provided with yielding button-retaining means; and an operating-button having a

portion extending through the slot in the said body and provided with an outwardly-facing



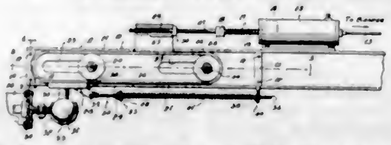
retaining-abutment engageable with the button-retaining means of the said carrier.

2,101,597
LOCKABLE IRONING BOARD
Chester A. Rich, Cincinnati, Ohio, assignor to The Rich Pump & Ladder Company, Cincinnati, Ohio, a corporation of Ohio
Application January 29, 1935, Serial No. 3,936
16 Claims. (Cl. 38—117)



1. An ironing board structure comprising in combination a table member having a front end, a rear end, and an under surface, a rear leg structure pivoted upon the table member for movement to a collapsed position substantially flat against the under surface of the table member, and to an operative position at which it is extended relative to the table member, a toggle means comprising a toggle bar and a rear leg bracing means adapted to be inclined relative to the table member when the rear leg structure is extended, a front leg structure for supporting the front end of the table member and movable to extended and collapsed positions relative thereto, a latch piece on the front leg structure, a disengageable latch on the table member located adjacent to the toggle means when the ironing board structure is disposed in the operative position and arranged to engage the front leg latch piece in the collapsed position of the ironing board structure, and means to hold the front leg structure in the extended position during use of the ironing board.

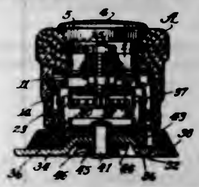
2,101,598
NONREUSABLE BOTTLE
William Riedel, Lansdowne, Md.
Application March 17, 1937, Serial No. 131,468
1 Claim. (Cl. 215—32)



In a bottle construction having a neck, said neck being provided with a pair of longitudinally spaced shoulders therein, a valve-like closure head for disposition in the neck, a stem extending from the head and into the bottle a substantial distance, said head and stem having a duct extending longitudinally therethrough, and detent means on the stem interposed between the said shoulders, said detent consisting of a cup-shaped member of compressible material, the bottom of the cup-shaped member having an opening therein for receiving the stem, said stem being provided with a circumferentially extending groove for receiving the portion of the bottom of the cup surrounding the opening therein.

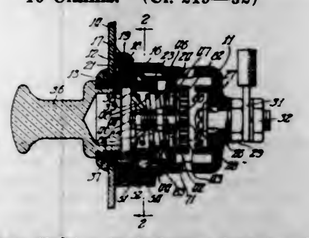
2,101,599
HOLDING AND SERVING MACHINE FOR ICE CREAM OR THE LIKE
Harry Sandiant, Wellington, New Zealand
Application December 1, 1936, Serial No. 113,735
In New Zealand November 28, 1935
19 Claims. (Cl. 107—21)

1. An ice cream cutting and delivering device, comprising a container for said ice cream, means for severing a portion of the ice cream, means for supporting and feeding said ice cream toward the severing means, driving means common to the severing means and the feeding means, means for selectively varying the extent of movement of the feeding means for regulating the quantity of ice cream to be severed, said supporting and feeding means comprising a conveyer frame, a conveyer movable over said frame toward the severing means, a supply spool for said conveyer rotatably mounted on said frame, and a waste paper spool rotatably mounted beneath said frame and operatively connected to said common driving means for winding the paper conveyer about said spool after the latter has delivered the ice cream to said severing means.



2,101,600
AUTOMATIC TRAILER BRAKE APPLIANCE
Amil Sandul, Humboldt, Minn., assignor of one-half to Phil Baldwin, Humboldt, Minn.
Application February 18, 1937, Serial No. 126,465
3 Claims. (Cl. 188—142)

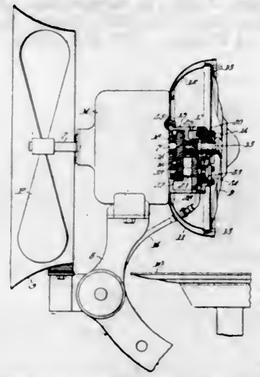
1. In combination, a tongue attachable to a trailer, a body movable on the tongue attachable to a draft vehicle, brake applying mechanism for a trailer, means to operate the latter mechanism through movement of the body relatively to the tongue incident to application of the brakes of a draft vehicle, said body having elongated slots, axles on the tongue extending through the slots,



said body having flanges, wheels on the axles engaged by the flanges, said tongue having an elongated slot, a stud extending through said slot, a push rod for the brake-applying means carried by the stud.

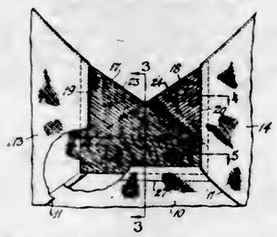
2,101,601
CIGAR LIGHTER
John Sinko, Chicago, Ill.
Application January 16, 1935, Serial No. 2,087
20 Claims. (Cl. 219—32)

1. In a cigar lighter, a removable lighter unit comprising an integral tubular body of insulating material, a hub permanently supported by radially extending arms inside said body intermediate the ends, an igniting element having a stud extending through said hub for removably supporting the element in the hub in one end of the body, and a unit supporting ring inside the body surrounding the element and clamped between said element and hub.



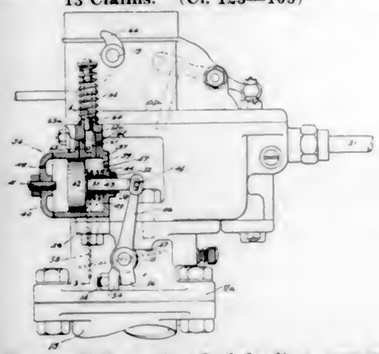
2,101,602
CIGAR LIGHTER
John Sinko, Chicago, Ill.
Application September 7, 1935, Serial No. 39,561
10 Claims. (Cl. 219—32)

1. A cigar lighter including a housing formed of insulating material, a threaded coupler secured at one end of said housing, an outwardly flanged ring screwed into said coupler for securing it to a suitable conductive support member, a conductor carried by the other end of said housing, a removable plug including a resistance element and extending into said housing through said ring, and means for electrically connecting said resistance element to said conductor and to said support member.



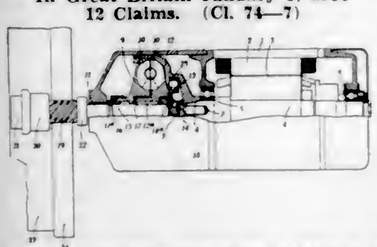
2,101,603
HUMIDIFIER
Samuel Carl Stimson, Winston-Salem, N. C., assignor to The Bahnson Company, Winston-Salem, N. C., a corporation of North Carolina
Application November 13, 1935, Serial No. 49,611
2 Claims. (Cl. 261—90)

1. A unit adapted to be used with a humidifier of the type including a motor having a casing and a shaft, and a fan and a disk mounted upon opposite ends of said motor shaft; said unit comprising a gear box adapted to be secured to said motor casing, a shaft in said gear box, a disk mounted on said gear box shaft, a gear adapted to be secured to the shaft of the motor, a transmission train connecting said gear and said disk



shaft for rotating the latter at higher speed than said gear, an atomizer ring at the periphery of said disk, and a casing enclosing said atomizer ring and disk, said second casing being adapted to be attached to said motor casing.

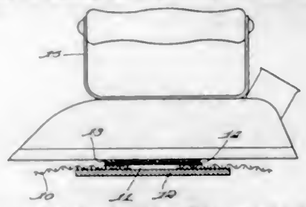
2,101,604
LADY'S UNDERGARMENT
Theodore J. Smutny, New York, N. Y., assignor to Collegiate Manufacturing Co., Inc., New York, N. Y., a corporation of New York
Application August 5, 1937, Serial No. 157,469
3 Claims. (Cl. 2—73)



1. An intimate garment of the class described, comprising a tubular body member of material cut on the bias and adapted to encircle the body of the wearer below the bust line, and an upper member of material cut on the bias and adapted to encircle the body in the bust region, said upper member having panels at the back of the garment, the upper edge of the back having a cut-out substantially at the center, said cut-out having bottom and side edges, the latter being at an angle to the bottom edge, a pair of partially overlapping elastic inserts of substantially triangular configuration secured at their edges to the edges of the cut-out, the inserts also having continuous horizontally disposed bottom edges secured to the lower edge of the cut-out, one side edge of each of the inserts being secured to a side edge of the cut-out, said inserts being positioned so that their principal direction of stretch is at an angle to each of the edges of the cut-out, whereby upon bodily movement of the wearer strain is reduced at the point of juncture of the edges of the cut-out and a freely swinging movement of the body is permitted without binding or other discomfort to the wearer.

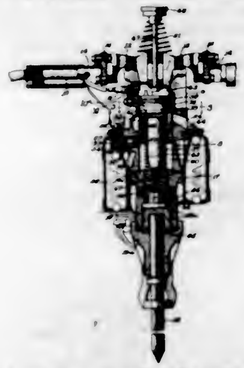
2,101,605
AUTOMATIC THROTTLE CONTROL
Edward A. Winfield, La Canada, Calif., assignor to California Machinery & Supply Co., Ltd., Los Angeles, Calif., a corporation of Delaware
Application June 13, 1936, Serial No. 85,092
13 Claims. (Cl. 123—103)

1. In a vehicle engine fuel feeding apparatus including a suction passage containing a throttle and having an air inlet and an outlet; means for supplying fuel to said passage through an orifice that is closed by said throttle when the throttle is fully closed, but which is opened by the throttle as the latter is slightly opened, means tending normally to maintain said throttle in partially open position during idling engine operation, and means for moving said throttle to fully closed position in which the throttle closes said orifice, when the engine is being driven by the vehicle.



2,101,606
ENGINE STARTER
John Ayres, Carshalton, England, assignor to Bryce Limited, Hackbridge, Surrey, England
Application January 4, 1937, Serial No. 119,053
In Great Britain January 9, 1936
12 Claims. (Cl. 74—7)

1. An engine starter including an electric motor and a pinion arranged to be driven from the motor armature shaft, characterized by fluid coupling means interposed between the motor and the pinion for protecting the starter against excessive load and back-fire shocks and consequent breakdown during operation, said coupling means comprising a driving member positively rotatable with the motor armature shaft, a co-acting driven member, and spring means urging the driven member into frictional engagement with said driving member.

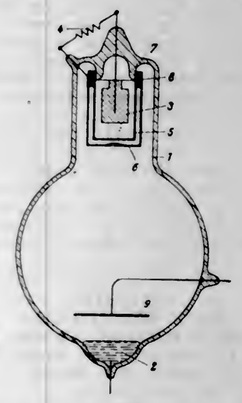


2,101,607
PATCHING MATERIAL
David Julian Block, Winnetka, Ill., assignor to Abraham Appel, Chicago, Ill.
Application July 17, 1935, Serial No. 31,946
1 Claim. (Cl. 2—243)

In the patching of fabric with a fabric patch containing a tacky adhesive, the steps of applying the patch to the fabric, and pressing the patch onto the fabric while resting upon blotting paper covering the opening in the material

being patched, whereby the adhesive which would otherwise be exposed contacts the blotting paper and is rendered non-tacky thereby.

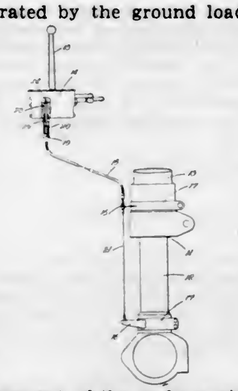
2,101,608
INTERNAL COMBUSTION HAMMER
Emmons R. Boddinghouse, Chicago, Ill., assignor to Gas Tool Patents Corporation, Chicago, Ill., a corporation of Delaware
Application August 13, 1934, Serial No. 739,553
9 Claims. (Cl. 123—7)



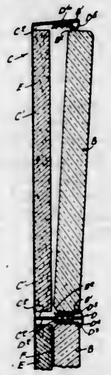
7. An internal combustion hammer comprising a cylinder provided with cooling fins extending radially outwardly therefrom and projecting longitudinally of the cylinder above the upper end thereof, handle supporting means, and a plunger guide carried by said fins above said cylinder and constructed to afford unobstructed passages between said fins to facilitate unrestricted upward flow of air between said fins.

2,101,609
TRAP
Lightle J. Cheek, Little Rock, Ark., assignor of one-third to H. M. Cheek, North Little Rock, Ark., and one-third to Golden Blount, Searcy, Ark.
Application December 5, 1935, Serial No. 53,071
Renewed September 9, 1937
4 Claims. (Cl. 43—76)

1. A trap including a receiving compartment, a bait compartment having an outlet into the receiving compartment and an inlet, guards at the sides of the inlet and outlet, a counterbalanced gate pivotally mounted between the guards at the inlet, a pivoted gate normally closed by gravity between the guards at the outlet, a tripping plate and a resetting plate tiltably mounted in superposed relation between the guards at the outlet, a bait carrying arm extending from the tripping plate and overlying the inlet gate, a resetting arm on the resetting plate, and means on the inlet gate and overlying the resetting arm for actuation by said arm to open the inlet gate.



2,101,610
ELECTRIC DISCHARGE TUBE
Walter Dällenbach, Berlin-Charlottenburg, Germany, assignor to N. V. Machinerieen-en Apparaten Fabrieken "Meaf", Utrecht, Netherlands
Application September 27, 1935, Serial No. 42,498
In Germany October 5, 1934
10 Claims. (Cl. 250—27.5)



1. An electric discharge tube for the production of high frequency oscillations comprising a closed vessel, an anode, a cathode, an ionizable medium of sufficient pressure to maintain an arc-like discharge between said electrodes when potentials are applied to the latter, a plurality of walls slightly spaced from each other and being disposed between the electrodes and having aligned openings therein, each of said openings having a diameter of the order of the magnitude of the mean free path lengths of the particles of said medium, whereby the discharge path through said openings is constricted to a cross section corresponding to the order of the magnitude of the mean free path of the particles in the ionizable medium and the prevailing current density of said discharge adjacent said openings causes an ion paucity whereby the potential drop in the vessel increases with increase of current.

2,101,611
LOCKING MEANS FOR RETRACTABLE AIRCRAFT LANDING GEAR
George Herbert Dowty, Cheltenham, England
Application June 22, 1937, Serial No. 149,770
In Great Britain March 12, 1936
8 Claims. (Cl. 244—102)

1. In an aircraft undercarriage, retracting means for moving the undercarriage from an operative to an inoperative position, such undercarriage including yieldable shock-absorbing means under ground load, locking means to prevent operation of the retracting means, and means operated by the ground load shock absorbing movement of the undercarriage to actuate the locking means.

2,101,612
PANEL MOUNTING
Charles G. Duffy, Brooklyn, N. Y., assignor to Sealed Joint Products Co., Inc., a corporation of Delaware
Application August 22, 1936, Serial No. 97,473
21 Claims. (Cl. 72—19)

1. In or for building construction, the combination of panel members arranged in courses and supporting devices for the courses of panel members located between the courses and presenting each a pair of oppositely extending beads engaging the panel members in adjacent courses at their edges to hold the same in place, and a portion adjacent the beads against which the panel members rest when in place, said supporting devices being yieldable rearwardly of the beads to allow the beads to be moved as a unit in permitting the panel members to be snapped into place between a pair of such devices, said devices also presenting visible portions between adjacent courses to lend a finished appearance to the construction.

2,101,613
HIGH SPEED SEAGOING SHIP
Rudolf Engelmann, Berlin, Germany
Application January 18, 1935, Serial No. 2,315
14 Claims. (Cl. 114—59)

1. A high speed seagoing ship having a substantially spindle-shaped underwater body, a su-

perstructure projecting upward from said body, the periphery of the plane of intersection between said body and said superstructure lying in a single plane, such plane being also the same plane as the operating water line, the upper edge of said superstructure in a side view of the ship presenting for a portion intermediate its length

a straight line which at each end curves convexly toward and as far as the upper edge of said underwater body, the side walls of the end portions of said superstructure being slightly arched outward, said side walls meeting in a vertical plane through the longitudinal axis of the ship to form a roof.

2,101,614

METHOD OF MAKING A PAVING MATERIAL

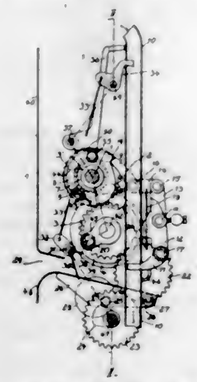
James W. Fraser, Cleveland, Ohio

No Drawing. Application August 26, 1935, Serial No. 37,981

3 Claims. (Cl. 106—31)

1. The method of making paving material which comprises cold-mixing maltha-containing rock material having a maltha content of approximately three per cent by weight with asphaltic cement made liquid by 25 to 40 parts by weight of solvent, such as naptha, to thereby obtain a ratio of extracted maltha to cement of approximately 1:4.

2,101,615



COIN CONTROLLED PREPAYING MACHINE FOR MAIL

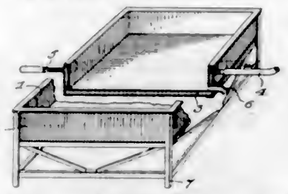
Wilhelm Friedrichs, Reinickendorf-Ost, near Berlin, Germany

Application November 21, 1934, Serial No. 754,137

In Germany April 23, 1930

14 Claims. (Cl. 194—19)

1. In a coin-controlled prepaying machine for mail, a printing member, coin controlled mechanism for operating said printing member, a coin chute for conducting coins to said mechanism, a gate adapted to be moved by an article to be mailed, and means operatively connected to said gate for retaining a coin inserted in said chute and adapted to be rendered inoperative upon movement of the gate by an article to be mailed.



2,101,616

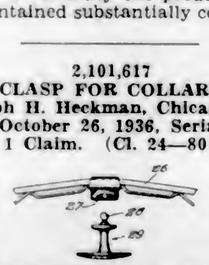
VITREOUS ENAMELING PROCESS

Herman F. Gilbert, Greenville, Mich., assignor to Gibson Electric Refrigerator Corporation, a corporation of Michigan

Substitute for application Serial No. 683,457, August 3, 1933. This application February 23, 1937, Serial No. 127,284

4 Claims. (Cl. 91—72)

1. The process of vitreous enameling which comprises milling a mass of enamel frit, opacifying agent, setting up agent and water, whereby the mass becomes heated and aerated, aging the resulting mixture for an extended period to cool the same and remove air, thus producing an enamel slip of a predetermined viscosity, dipping articles to be coated into the slip, the temperature of the slip being directly controlled throughout the active life thereof to prevent a temperature change after the completion of the aging operation of more than 25° F., and maintaining the temperature thereof after aging below a maximum of 85° F. whereby the predetermined viscosity is maintained substantially constant.



2,101,617

CLASP FOR COLLARS

Joseph H. Heckman, Chicago, Ill.

Application October 26, 1936, Serial No. 107,676

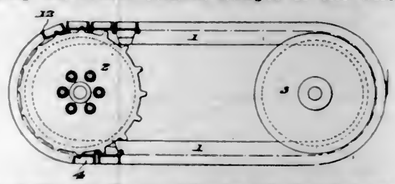
1 Claim. (Cl. 24—80)

Apparatus for holding a collar and tie in proper position, including: a transverse bar member of sufficient length to extend from one front edge portion of said collar to the other front edge portion thereof, beneath said tie; means on each end of said bar adapted to frictionally engage the edge portions of said collar; a collar button member adapted to be received by registering openings in each end of the band of said collar; a ball on one of said members; and a cup shaped socket on the other of said members having spring means therein and adapted to yieldingly retain said ball, movement of said ball member into and out of said socket being in a substantially horizontal direction.

2,101,618

ENDLESS TRACK FOR VEHICLES

Adolphe Kegresse, Paris, France



Application May 22, 1935, Serial No. 22,895

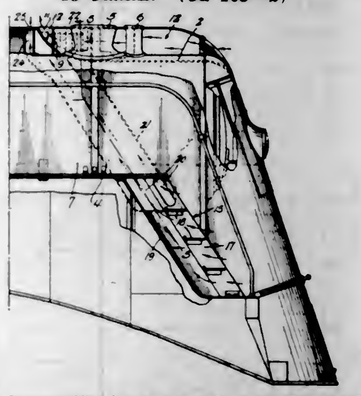
In France May 29, 1934

5 Claims. (Cl. 305—8)

1. An endless track vehicle comprising spaced carrying wheels each formed of two axially spaced parallel discs, each of said discs being provided at its periphery with a frusto-conical flange, and an endless track extending about said wheels, said endless track comprising pivotally connected tread plates and guiding ribs

projecting from the inner faces of the plates, said ribs having inclined base portions for engaging the frusto-conical flanges of the wheels,

and teeth on the peripheries of the flanges of one of said wheels extending through openings in said plates for transmitting driving motion from said wheel to said track.



2,101,619

LOCOMOTIVE STRUCTURE

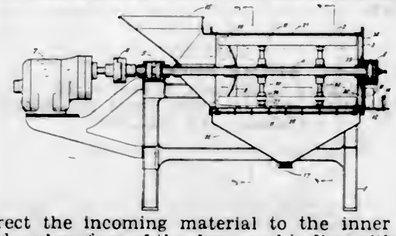
William L. Lentz, Tuckahoe, N. Y., and Carl F. Kantola, Ashtabula, Ohio, assignors to The New York Central Railroad Company, a corporation of New York

Application September 26, 1935, Serial No. 42,344

13 Claims. (Cl. 105—2)

1. A locomotive having a cab, a smoke stack located forwardly of the cab, an air scoop adjacent said stack and at least partially surrounding the stack and having an inclined surface for directing the scooped air upwardly to lift the smoke issuing from the stack to a level above the level of the cab, air scoops at the front and on opposite sides of the locomotive and having inclined surfaces for directing air upwardly and rearwardly, and air conductors leading from the second-named scoops to and communicating with the first-named scoop.

2,101,620



PULPER

Harold R. Lewis, Hoopeston, Ill., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware

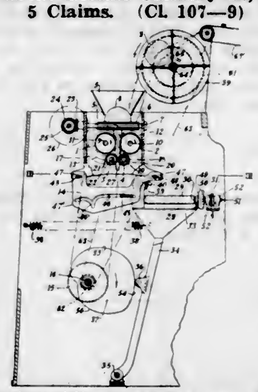
Application February 12, 1934, Serial No. 710,781

11 Claims. (Cl. 146—174)

1. A pulping machine including a perforated drum, a shaft extending longitudinally therewithin, means for driving said shaft, and a sweep secured to said shaft for rotation therewith to sweep material around the drum and force it against the perforations in said drum, the relation between the curvature of the inner surface of the drum and the path of revolution of the sweep being such that the sweep alternately approaches and recedes from the surface of the drum as it revolves, and a baffle having spaced beater blades cooperating with the said sweep to

direct the incoming material to the inner peripheral surface of the drum and in line with the travel of the sweep.

2,101,621



DOUGH MOLDING MACHINE

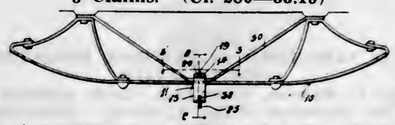
Louis Jacob Philipp Maas, London, England

Application January 22, 1937, Serial No. 121,873

In Great Britain January 24, 1936

5 Claims. (Cl. 107—9)

1. A dough molding machine comprising a carrier having a flap, means for feeding a flattened piece of dough onto said flap and carrier, means for oscillating said flap relatively to said carrier for the purpose of folding the dough fed to it and the carrier, and means for reciprocating said carrier relatively to said feeding means for the purpose hereinbefore set forth.

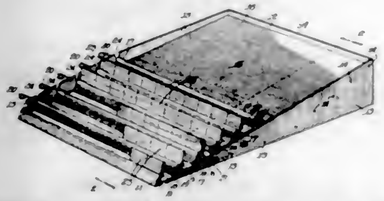


2,101,622

TRAILER HITCH COUPLING

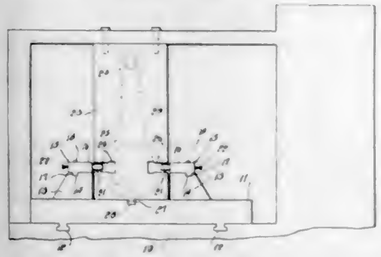
Robert R. D. Milligan, Portland, Ind.

Application March 4, 1937, Serial No. 129,036



3 Claims. (Cl. 280—33.15)

1. A coupling device of the class described for engagement with a bumper or the like, the device comprising one sheet of metal having an intermediate portion, a jaw extending from said intermediate portion, a portion extending from the intermediate portion in the opposite direction to the jaw and returned past the intermediate portion and terminating in a hook lug, the returned portion and part of the second mentioned portion beneath it having an aperture

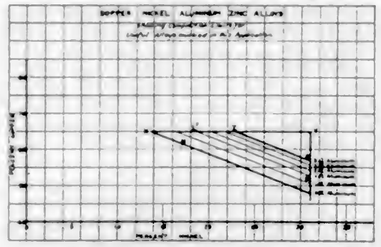


therethrough for the reception of a trailer drawbar, a bolt pivoted to the hook lug, and fastening means on the bolt for clamping engagement with the jaw.

2,101,623
STAMP SUPPORT
Richard O. Morgan, Evanston, Ill.
Application May 18, 1936, Serial No. 80,428
6 Claims. (Cl. 206—73)

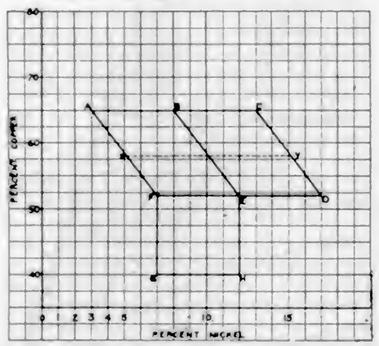
4. In apparatus of the character set forth, a casing equipped with downwardly and forwardly inclined sides, plate dividers pivotally supported in said sides and in stepped relation, each of said dividers being provided near its forward portion with an upwardly extending shoulder spaced a short distance ahead of the front edge of the divider thereabove.

2,101,624
CUTTING JIG
Anthony S. Muller, Pontiac, Mich.
Application June 25, 1936, Serial No. 87,277
3 Claims. (Cl. 90—33)



1. A device of the class described comprising a machine body, a bed movable on said body, a work holding plate suspended on said body and beneath which the bed moves, said plates resting on and being supported by the bed, and jig means on said bed on opposite sides of the plate to coact with work supported by the plate.

2,101,625
HIGH STRENGTH CORROSION RESISTANT COPPER ALLOY
Elmer L. Munson, Naugatuck, Conn., assignor to The American Brass Company, Waterbury, Conn., a corporation of Connecticut
Application June 1, 1937, Serial No. 145,744
7 Claims. (Cl. 148—32)

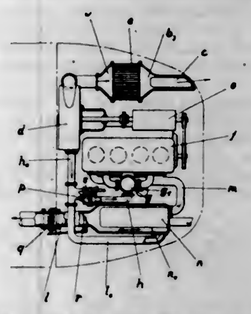


1. An alloy composed of copper, nickel, zinc, and aluminum within the following ranges:

	Percent
Copper	48 to 65
Nickel	13.5 to 31
Aluminum	0.5 to 3
Zinc (plus impurities)	1 to 21

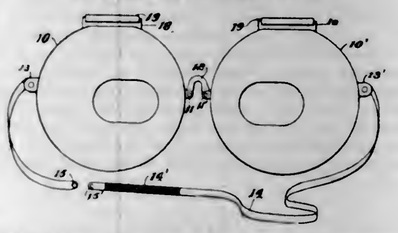
and in which the copper range for a given aluminum content is increased progressively as the nickel is increased.

2,101,626
HOT WORKABLE COPPER ALLOYS
Elmer L. Munson, Naugatuck, Conn., assignor to The American Brass Company, Waterbury, Conn., a corporation of Connecticut
Application July 13, 1937, Serial No. 153,332
8 Claims. (Cl. 75—155)



1. An alloy composed of copper, nickel, zinc and aluminum in proportions within the following ranges,

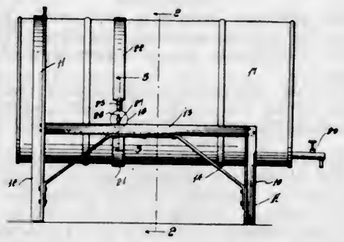
	Percent
Copper	40 to 65
Nickel	3 to 17
Aluminum	0.5 to 3
Zinc (plus impurities)	19 to 52.5



and in which as the copper is decreased from 65% to 52% the minimum nickel is increased from 3% at 65% copper up to 7% at 52% copper and the maximum nickel content increases from 13% at 65% copper to 17% at 52% copper; and with from 52% to 40% copper the nickel content is limited to the range 7% to 12%.

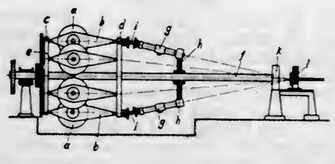
2,101,627
MOTOR VEHICLE WITH COMPRESSED AIR COOLING
Fritz Nallinger, Stuttgart, Germany, assignor to Daimler-Benz A. G., Stuttgart-Unterturkheim, Germany
Application November 16, 1935, Serial No. 50,248
In Germany October 20, 1934
9 Claims. (Cl. 123—119)

1. In a power driven vehicle, the combination of a water-cooled internal combustion engine for driving the vehicle and a cooling water circulation system for the engine including a radiator with a pressure blower operatively connected to the engine for supplying cooling air under pressure to the radiator, an air-heating chamber arranged so as to be swept over by exhaust gases from the engine, an air delivery conduit for the pressure blower, a branch conduit in open communication with said air delivery conduit and arranged to deliver cooling air to the radiator, a second branch conduit in open communication with said air delivery conduit and arranged to supply air to the intake of the internal combustion engine and a third branch conduit arranged to deliver air to said heating chamber.



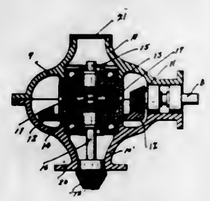
2,101,628
ICE BAG
Valerie B. Padelford, Washington, D. C.
Application February 18, 1935, Serial No. 7,125
Renewed January 13, 1937
4 Claims. (Cl. 150—2.3)

1. A temperature controlling device comprising a bag of a size to reach from adjacent the nose of a patient to a point beyond the eye, the bag having a ring-shape with its opening for the eye of the patient and having a soft inner wall adapted to fit and contact with the face above, below and at the sides thereof, the inner wall of the ring being of a width to extend from the inner edge of the eye to a point adjacent to the center of the face.



2,101,629
BARREL RACK
Lewis O. Porter, Ovid, Colo.
Application October 22, 1936, Serial No. 107,077
5 Claims. (Cl. 248—129)

1. A device of the class described comprising a rack having an arch member whose terminals constitute legs, track members extending from the arch member, legs secured to the free ends of said track members, supporting means coacting with the arch member adjacent the base of the latter, and said track members being engageable by means on a barrel adapted to enter



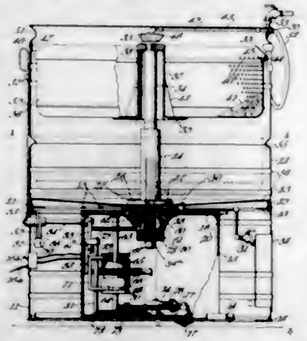
between the arch member and said supporting means.

2,101,630
MACHINE FOR PRODUCING ROPES FROM STEEL WIRES
Julius Rath, Lippstadt, Germany
Application February 1, 1937, Serial No. 123,496
In Germany June 26, 1936
3 Claims. (Cl. 117—20)

1. A machine for producing strands and ropes from steel wires, comprising in combination a rotary axle, carriers fixed near one end of said axle, reel frames rotatably mounted on said carriers, wire feeding reels one in each of said frames, a stationary laying die in the axis of said shaft, wire straightening devices one between each of said reels and said laying die, each straightening device rotatable about its wire as an axis, and means for driving the straightening devices in the same direction and at the same speed as the reel frames.

2,101,631
TRACTOR CONSTRUCTION
Evert O. Sarff, Roseburg, Oreg.
Application February 6, 1937, Serial No. 124,441
3 Claims. (Cl. 74—417)

1. In tractor construction embodying the use of frame, power unit, differential mechanism and ground wheels of old automobiles, a reduction gear system in the transmission line thereof, comprising a differential mechanism having a ring gear driven by the power unit, side gears driving axle shafts, and spider gears meshing with and welded to the side gears.



2,101,632
METHOD OF LUBRICATING BEARING SURFACES
William Whitney Weinrich, Pittsburgh, Pa., assignor to Gulf Research and Development Company, Pittsburgh, Pa., a corporation of Delaware
No Drawing. Original application November 12, 1935, Serial No. 49,442. Divided and this application November 18, 1936, Serial No. 111,558
4 Claims. (Cl. 87—9)

1. A method of lubricating bearing surfaces in internal combustion engines when subjected to conditions of operation which comprises maintaining between bearing surfaces, one of which is an alloy formed chiefly of a metal selected from the class consisting of cadmium and copper, a film of lubricating oil which initially produces an effective lubricating action but which would normally tend to corrode the aforesaid alloy, and maintaining the effectiveness of the lubricating oil by incorporating therein tributyl phosphite in a small but sufficient proportion substantially to retard the corrosion.

2,101,633
FOOD PRODUCT AND PROCESS FOR MAKING SAME
Randall Whitaker, Samuel M. Weisberg, and Luther D. Hilker, Baltimore, Md., assignors to Sealtest System Laboratories, Inc., New York, N. Y., a corporation of Maryland
No Drawing. Application August 26, 1935, Serial No. 38,004
16 Claims. (Cl. 99—20)

10. The process of preparing an edible wafer or chip-like product which comprises forming of a composition including a colloidal dispersion of peptized casein in amount to constitute a bond for maintaining the structure of the product, forming the same into wafer or chip-like units, and heat-treating the units to produce a wafer or chip of crisp texture.

2,101,634
WASHING MACHINE
Arthur A. Aldridge, Paxtang, Pa., assignor of one-fourth to William A. Laird, Chambersburg, Pa., and one-half to William T. Gardner, Pittsburgh, Pa.
Application October 2, 1926, Serial No. 139,118
21 Claims. (Cl. 68—18)

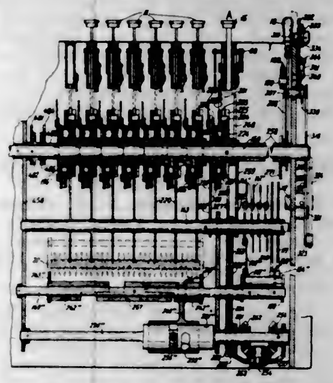
1. In a washing machine, the combination of a tub, a perforated container for the clothes to be washed, means for elevating said container within said tub and rotating it for centrifugally drying the clothes, a removable lid for said tub, and means carried by said lid for supplying water for rinsing the clothes while said lid is in place on said tub.

6. In a washing machine, the combination of a tub, a perforated container, a vertically disposed driving shaft supporting said container and having a gear thereon, gearing adapted to positively engage said gear to oscillate said container, gearing for frictionally driving said gear to rotate said container continuously in one direction, power means, and means for alternatively connecting said power means to one or the other set of gearing.

8. In a washing machine, the combination of a tub, a perforated container having a centrally disposed hub projecting upwardly from the bottom of the container, outwardly projecting fins on said hub, radially disposed baffle plates within said container, and means for oscillating said container.

11. In a washing machine, the combination of a tub, a perforated container mounted for rotation within said tub on a vertical axis, said container having an annular trough depending therefrom adjacent its upper edge, and means for oscillating said container, raising said container and rotating said container at high speed to centrifugally force material from said trough.

2,101,635
RESIN DEHYDRATION
Howard L. Bender, Bloomfield, N. J., assignor to Bakelite Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application April 16, 1931, Serial No. 530,721
7 Claims. (Cl. 106—22)



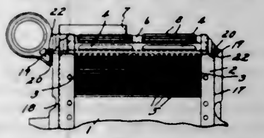
1. Process for removing volatile liquid from a fluid mixture including with the volatile liquid a synthetic resin hardening to a solid infusible state upon heating which comprises projecting the mixture in the form of finely divided particles into a current of relatively dry gas heated to a temperature causing volatilization of the liquid and sufficiently high to cause fusing and heat-hardening of the resin, and limiting the time of contact of the heated gas with the mixture so as to secure substantial removal of the liquid but without transforming the resin to its heat-hardened state.

2,101,636
CASH REGISTER, ACCOUNTING, AND THE LIKE MACHINE
Ernst Breitling, Berlin-Tempelhof, and Hans Schwenk, Berlin, Germany, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Application October 5, 1935, Serial No. 43,730
In Germany February 15, 1935
10 Claims. (Cl. 235—7)

1. In a machine of the class specified, several control key banks, a machine conditioning means, a machine releasing means, and actuating means for said releasing means comprising a rockable member having a variable centre of movement controlled by said control key banks in cooperation with the machine conditioning means in accordance with the condition of the machine determined by the conditioning means.

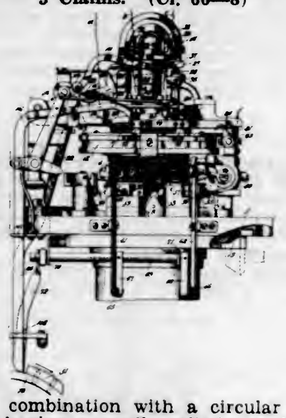
5. In a machine of the class described, the combination of a plurality of totalizers on a common shiftable support, actuators therefor, means to shift the support to shift the totalizers relatively to the actuators to select a totalizer for actuation,

a plurality of keys, one of said keys normally controlling the shifting means to select a certain one of the totalizers, and a manipulative device to



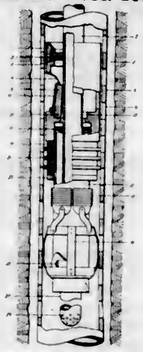
change the normal relationship between the shifting means and the keys so that said one of the keys selects another totalizer.

2,101,637
MULTIPLE ACTION THERMOSTAT
George Howlett Davis, Washington, D. C.
Application August 23, 1935, Serial No. 37,421
16 Claims. (Cl. 200—138)



1. A multiple action thermostat for actuating electrically operated mechanisms in circuit therewith said thermostat comprising a bimetal blade which acts as a fixed thermostat and operates under slow or ordinary accidental fire conditions at a predetermined temperature for which it has been adjusted, a secondary quick-acting bimetal blade acting as a rate-of-rise thermostat and which operates independently under any sudden increase in the speed of movement of the heated air, and means for directing said rapidly moving heated air first and mostly against the said secondary bimetal blade.

2,101,638
VENTILATING SYSTEM FOR ARC LAMPS
Wayne D. Brenkert, Detroit, Mich., assignor to Brenkert Light Projection Company, Detroit, Mich., a corporation of Michigan
Application March 2, 1937, Serial No. 128,657
10 Claims. (Cl. 176—115)



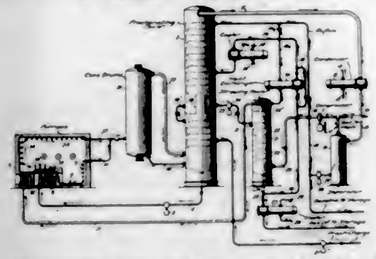
1. In an arc lamp, a housing having a ventilating zone in the upper portion thereof, a flue communicating with said zone, means for admitting air to said zone, and means above the first named means, for admitting air from the atmosphere directly to said flue.

2,101,639
CIRCULAR KNITTING MACHINE
Arthur A. Caudle, Hendersonville, N. C., assignor to James P. Grey, Charles L. Grey, and James P. Grey, Jr., a co-partnership doing business as Grey Hosiery Mills, Hendersonville, N. C.
Application December 8, 1934, Serial No. 756,692
3 Claims. (Cl. 66—8)

3. The combination with a circular knitting machine having a needle cylinder and a main knitting station with yarn feeding means and knitting cam mechanisms, of a plurality of auxiliary knitting stations spaced apart and from said main knitting station circumferentially of said cylinder, yarn feeding means at said auxiliary stations respectively, stitch cams at said auxiliary stations respectively, means for simultaneously moving said yarn feeding mechanisms between operative and inoperative positions, means for simultaneously moving said stitch cams betwen operative and inoperative positions, said auxiliary stations when active being adapted to knit a corresponding number of courses in addition to the course knit at the main station, and a single set of yarn clamping and cutting devices for acting on the yarns fed at all of said auxiliary stations.

2,101,640
METHOD AND APPARATUS FOR CEMENTING WELLS
William Cantwell Chonette, Ojai, and Robert H. Hamilton, Los Angeles, Calif., assignors to Shell Development Company, San Francisco, Calif., a corporation of Delaware
Application October 7, 1935, Serial No. 43,848
9 Claims. (Cl. 166—21)

1. In the process of cementing wells provided



with casing, the steps of lowering thereinto a packer body detachably attached to a tubing string extending through the packer body, anchoring said body within the casing against upward motion, placing a fluid cementing mixture below the packer body withdrawing the tubing from the packer body, closing the bore in the packer body, and applying the mechanical pressure of the tubing string to the top of the packer body, said pressure being sufficient to move the packer body downward and to force the cementing mixture below the packer body into the space between the walls of the borehole and the casing.

2,101,641

METHOD OF PRODUCING COKE

Maurice B. Cooke, Plainfield, N. J., and Hermann C. Schutt, North Tarrytown, and John W. Throckmorton, New York, N. Y., assignors to Alco Products Incorporated, New York, N. Y., a corporation of Delaware

Application April 20, 1934, Serial No. 721,496
2 Claims. (Cl. 202—16)

1. A process for producing solid coke from asphaltums, asphaltic residuums or heavy petroleum oils, comprising the steps of passing the oil to a fractionating zone, withdrawing the residue therefrom, passing the residue to a heating zone and there heating the residue, passing the heated residue to a carbonizing zone, removing the uncondensed mixture of hydrocarbon vapors and gases from the fractionating zone, cooling the mixture sufficiently to condense the distillate therefrom and leave a substantially gasoline free lean gas, passing a stream of the lean gas to a stripping zone, withdrawing a side stream from the fractionating zone and passing it to the stripping zone, intimately contacting the lean gas in the stripping zone with the side stream and withdrawing the stripped side stream from the stripping zone, withdrawing from the stripping zone the mixture of lean gas and products stripped from the side stream, heating the gaseous mixture, physically mingling the heated gas with the heated residue passing to the carbonizing zone, effecting carbonizing of the condensate by the heated gas under time temperature conditions productive mainly of hydrocarbon vapors and a solid dry coke, and returning the vapors to the fractionating zone.

2,101,642

MOLDING COMPOSITION

Ernst Elbel and Fritz Seebach, Erkner, near Berlin, Germany, assignors to Bakelite Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application September 28, 1933, Serial No. 691,355. In Germany October 8, 1932
6 Claims. (Cl. 106—22)

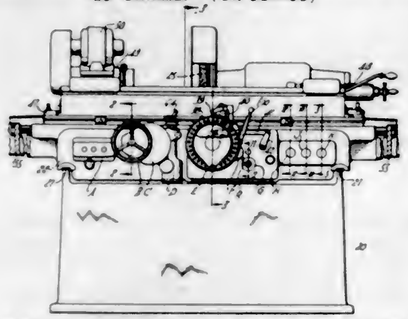
1. Process of preparing a moldable composition from a phenol-aldehyde resin that is hardenable in a mold under the action of heat and pressure without detectable free ammonia in the molded article when hexamethylenetetramine is included as a hardening agent which comprises modifying the resin to a partial extent at least by esterification of the resin by a member of the group of acid anhydrides and acid chlorides, and mixing the ester-modified resin with a filler and with hexamethylenetetramine to act as a hardening agent for the resin in a molding operation.

2,101,643

PROCESS FOR THE FRACTIONATION OF PETROLEUM OILS

Ernest F. Engelke, Camden, N. J., assignor, by mesne assignments, to Power Patents Company, Jersey City, N. J., a corporation of Maine

No Drawing. Application July 30, 1930, Serial No. 471,887
11 Claims. (Cl. 196—13)



1. In the production of lubricating oils from petroleum oil residuums, the process which comprises thoroughly mixing the residuum with about an equal volume of a mixture comprising about two parts of a secondary amyl alcohol and about five parts of secondary butyl alcohol, adding to the resulting solution a volume of isopropyl alcohol sufficient to precipitate the desired fraction of oil, mixing this first precipitate formed with about an equal volume of a mixture comprising about two parts of a secondary amyl alcohol and about five parts of secondary butyl alcohol, again precipitating with about half the quantity of isopropyl alcohol previously used, again precipitating the first solution with isopropyl alcohol, and then separating the alcohol from the resulting oil fractions by distillation.

2,101,644

GRINDING MACHINE

Hans Ernst, Charles Herfurth, and Lester F. Nenninger, Cincinnati, Ohio, assignors to Cincinnati Grinders Incorporated, Cincinnati, Ohio, a corporation of Ohio

Application September 10, 1935, Serial No. 39,951
19 Claims. (Cl. 51—95)

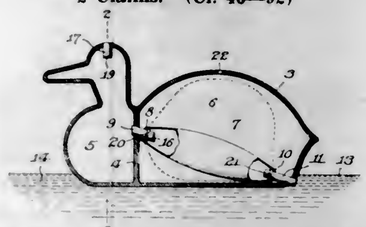
1. In a machine of the character described, the combination with a pair of relatively translatable parts, of a first hydraulic circuit effective to determine the translation of the parts, a second hydraulic circuit alternatively available for effecting corresponding movement of the parts, selector means for operatively coupling one or the other of said circuits with the parts to be shifted, settable means for predetermining the rate of movement to be effected by one of the circuits, and movable means included in the other circuit for effecting a rate of shifting of the parts proportionate to the rate of movement of said latter means.

2,101,645

INSECTICIDE AND FUNGICIDE

Robert A. Fulton and Willis Conard Fernelius, Columbus, Ohio, dedicated to the free use of the Public in the Territory of the United States of America

No Drawing. Application May 25, 1937, Serial No. 144,610
1 Claim. (Cl. 167—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



A material for use in combatting economically harmful plant and animal organisms, containing sulfur nitride as its essential active ingredient.

2,101,646

AQUATIC TOY

Burgess L. Gordon, Jr., Philadelphia, Pa., assignor to Hogan Inventions, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application November 28, 1936, Serial No. 113,108
Renewed September 20, 1937
2 Claims. (Cl. 46—92)

1. The combination of a hollow body constructed to float upon water and having a chamber therein whose walls are collapsible from a normal condition and automatically returnable to such condition to constitute an air pump, a stretchable rubber air bag carried by said body, a one-way valve admitting external air to said chamber, a one-way valve permitting air to pass from the chamber to the bag, and a part carried by said body and having an air passage extending therethrough, one end of said passage being in communication with said bag and the other end of said passage being exposed exteriorly of said body.

2,101,647

FLOTATION PROCESS

Herbert P. A. Groll, Oakland, Calif., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Application August 28, 1933, Serial No. 687,196
8 Claims. (Cl. 209—166)

1. A method of recovering minerals from ores which comprises subjecting an ore to a froth flotation operation in the presence of an isoalkenyl xanthate.

2,101,648

PROCESS AND PRODUCT RELATING TO UNSATURATED XANTHATES

Herbert Peter Augustus Groll, Berkeley, Calif., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Application January 30, 1933, Serial No. 654,253
11 Claims. (Cl. 260—99.11)

1. A method of making unsaturated xanthates, which comprises providing a mixture of a monoolefinic aliphatic monohydric alcohol, containing at least four carbon atoms to the molecule, and possessing the general formula

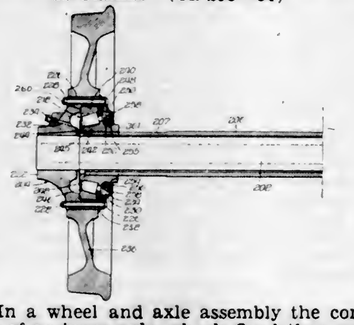
wherein X represents an isoalkenyl radical and Y represents a substituent of the class consisting of hydrogen and alkyl radicals, X being linked to the carbinol group by an unsaturated tertiary carbon atom, carbon disulfide, caustic alkali and water, and causing a reaction to take place to form an unsaturated xanthate.

2,101,649

XANTHATES OF UNSATURATED SECONDARY ALCOHOLS AND PROCESS FOR THEIR PREPARATION

Herbert P. A. Groll, Berkeley, Calif., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Application February 27, 1937, Serial No. 128,227
20 Claims. (Cl. 260—99.11)



1. A process for the production of an unsaturated xanthate which comprises providing a mixture of an unsaturated secondary alcohol, carbon disulphide and a basic metal hydroxide, and causing reaction to take place resulting in formation of a metal xanthate of the unsaturated secondary alcohol.

2,101,650

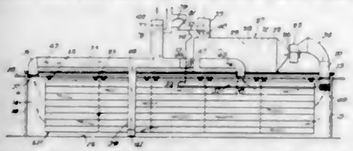
INBOARD ROLLER BEARING UNIT

Alfred H. Oelkers, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey

Application December 15, 1934, Serial No. 757,597
12 Claims. (Cl. 295—36)

12. In a wheel and axle assembly the combination of an inner axle, wheels fixed thereon, an outer axle, single course anti-friction bearings mounted thereon within the planes of said wheels and comprising thrust means abutting the ends of said outer axle, load carrying members slidably supported on the said outer axle adjacent the ends thereof, and other means integral with said bearings respectively extending beyond the planes of said wheels for abutment of said load carrying members.

2,101,651



APPARATUS FOR AND METHOD OF COOLING BREAD

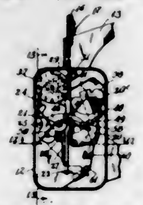
Wade W. Reece, Chicago, Ill., assignor to The W. E. Long Company, Chicago, Ill., a corporation of Illinois

Application March 28, 1932, Serial No. 601,568
21 Claims. (Cl. 107—54)

10. In cooling apparatus for bakery products, a cooling tunnel, means for conducting bakery products through said tunnel for cooling the same, means for causing a current of air of low

velocity to flow across a section of said tunnel adjacent the entrance end thereof, and means for

causing a stream of air of higher velocity to flow across a section of the tunnel adjacent the delivery end thereof.



2,101,652

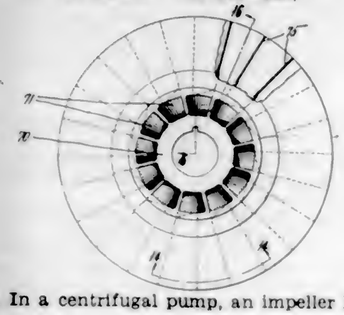
SAFETY EXPOSURE RECORDER FOR CAMERAS

Benjamin Robles, Palmira, Chuva, Guatemala

Application May 14, 1935, Serial No. 21,404

4 Claims. (Cl. 116—114)

1. In combination with a camera having a shutter operable with a depressible lever moving down and up for one exposure, a casing mounted on the front of said camera and having a window opening therein, a stem slidably mounted in said casing and having a rack portion thereon and adapted to be operatively connected with said depressible lever, a spindle pivotally mounted on said casing, a plate fixed on said spindle, a segmental gear fixed on said spindle and engaging said rack to pivot said plate when said stem is depressed, and a means engageable with a portion of said plate to indicate that said lever has been depressed, said means comprising a stud fixed on said casing, an indicator pivotally mounted on said stud and having indicating indicia on the face thereof and adapted to be viewed through said opening, a lug on said plate adapted to engage said indicator to pivot said indicator when said plate is pivoted by depressing and releasing said stem to change the indicia viewable through said opening.



2,101,653

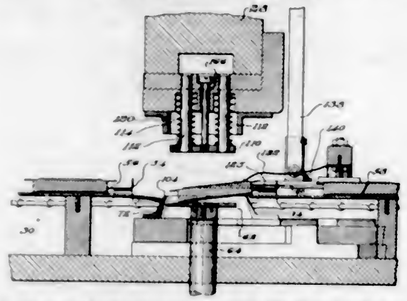
IMPELLER FOR CENTRIFUGAL PUMPS

Christopher A. Schellens, Marblehead, Mass., assignor to C-S Engineering Company, Englewood, N. J., a corporation of Delaware

Application September 1, 1934, Serial No. 742,461

12 Claims. (Cl. 103—115)

10. In a centrifugal pump, an impeller having a circular series of substantially contiguous inlet ports separated by thin blades at each side adjacent to the axis thereof and a single series of substantially contiguous discharge ports separated by thin blades along the circumference thereof, successive discharge ports communicating alternately with inlet ports at opposite sides of said impeller.



2,101,654

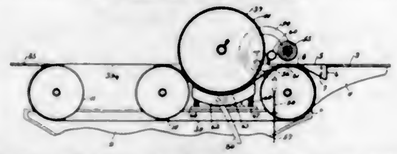
MACHINE FOR FINISHING MOLDED ARTICLES OF RUBBER

Edward A. Sheehan, Stoughton, Mass., assignor to Panther-Panco Rubber Co. Inc., Chelsea, Mass., a corporation of Massachusetts

Application January 23, 1934, Serial No. 707,956

3 Claims. (Cl. 164—20)

1. A machine for trimming heels or the like of rubber comprising a collapsible cavity die having a fixed heel portion and movable portions cooperating therewith to form the completed die, the die having a continuous peripheral cutting edge when in closed relationship, automatic feed means for advancing an article heel end foremost into contact with the heel portion of the die cavity, means for maintaining the trimming flange extended in the plane of the article to overlie the cutting edge, means for closing the die to force the article into a position determined by the fixed heel portion with the flange overlying the cutting edge, and means for engaging the article and forcing it inwardly of the cavity to shear the flange on the cutting edge.



2,101,655

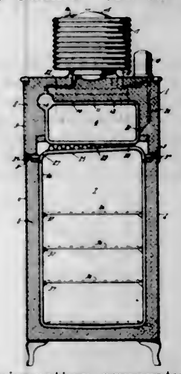
STEAMING AND PRESSING MACHINE

Wendell H. Shields, Grand Rapids, Mich.

Application January 13, 1936, Serial No. 58,992

6 Claims. (Cl. 38—3)

1. In a steaming and pressing machine, spaced apart rollers, an endless belt passing around said rollers, means for driving the rollers, a roller larger than the other rollers located between two of said first mentioned rollers and against the upper side of the belt and extending partially into the space between said rollers and bearing against one of said rollers through the said belt, means for driving the larger roller, means for feeding garments to be steamed and pressed onto the belt and underneath said larger roller, a shoe located underneath and adjacent the belt and under the larger roller and conforming at its upper side to the curvature of said upper roller and contacting therewith through said belt, and means for heating said shoe, said upper roller and with the roller against which the larger roller bears through the said belt, combined with means for steaming said garments before the same pass underneath said upper roller.



2,101,656

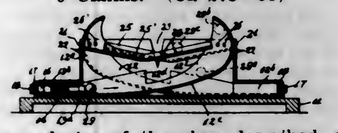
REFRIGERATING MACHINE

Christian Steenstrup, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application January 22, 1935, Serial No. 2,912

18 Claims. (Cl. 62—99)

9. In a refrigerating apparatus having a primary refrigerant evaporator and a secondary refrigerant evaporator containing a body of liquid refrigerant, means for supplying liquid refrigerant to said primary evaporator and means including a resilient heat conducting member arranged between said primary and secondary evaporators in heat exchange relationship therewith for transferring heat from the refrigerant in said secondary evaporator to the refrigerant in said primary evaporator.



2,101,657

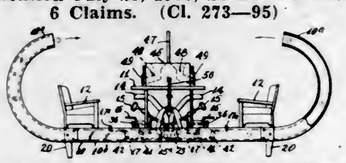
TWIN MARBLE SKILL GAME

Alexander Szabo, Linden, N. J.

Application July 23, 1937, Serial No. 155,194

6 Claims. (Cl. 273—95)

1. In a device of the class described, a body having a base portion and a top portion comprising several vertical walls dividing off a space with an open top, a pair of identical chutes longitudinally of said space and adjacent each other and extending in opposite directions and each having an outer portion and an inner portion, a ball shooter in the inner portion of each chute and operable from the outside of said base portion, means for holding the outer end of each chute vertically adjustable relative to said vertical walls for varying the inclination of the chutes, and a score board for each chute spaced from the outer end thereof and mounted on the outer end of the adjacent chute.



2,101,658

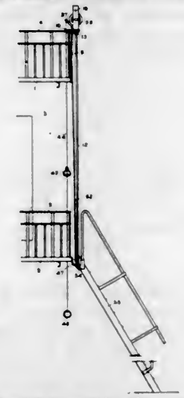
BALL RETURN AMUSEMENT DEVICE

Alexander Szabo, Linden, N. J.

Application July 23, 1937, Serial No. 155,195

6 Claims. (Cl. 273—95)

1. In a ball amusement device, a hollow body of substantially U-shape having its arms directed towards each other and having a flat portion connecting said arms so as to make a platform, a table mounted on the center of said platform, chairs mounted on said platform longitudinally thereof and on opposite sides of said table, other chairs mounted on said platform transversely thereof and on opposite sides of said table, a ball supply chute on each longitudinal side of said table and extending into the said hollow body, spring mechanisms within said hollow for shooting said balls through the hollow body so as to emerge from the ends of the arms thereof, handles for loading said mechanisms, foot pedals for shooting off said mechanisms, and foot controlled means for holding said balls in various positions relative to said shooting mechanism.



2,101,659

FIRE ESCAPE

Baldwin Vale, San Francisco, Calif.

Application August 26, 1936, Serial No. 97,933

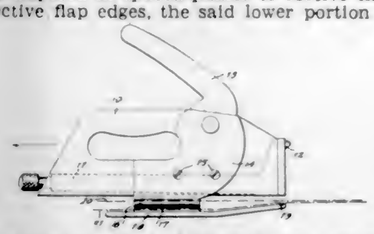
3 Claims. (Cl. 228—17.3)

1. In combination with the upper and lower platforms of a fire escape; a pair of rigid guides terminating in a lower bracket having a fulcrum forward of said guides; a vertically movable stair engaging said guides and slidable on said fulcrum.

2,101,660

STAPLING MACHINE FOR CLOSING FLAPS OF CARTONS AND THE LIKE

Max Vogel, Frankfort-on-the-Main, Germany



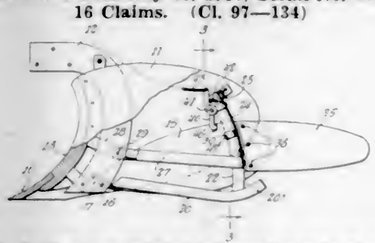
Application August 5, 1935, Serial No. 34,799

In Germany May 8, 1935

1 Claim. (Cl. 1—49)

In a stapling machine for stapling flaps of cartons or the like, a staple driving part, and a flap guiding base secured to said staple driving part formed from a single piece of sheet metal bent

to shape comprising a vertically disposed attaching portion, an upper horizontal flap supporting portion bent outwardly and then inwardly from said attaching portion to provide a material edge receiving recess, and a lower horizontal flap supporting portion bent from and extending in the opposite direction from said upper portion, said upper and lower portions being disposed in spaced planes to receive the respective flap edges, the said lower portion having a portion extended laterally with respect to said upper portion and inclined upwardly to a point contiguous to the plane of said upper portion and having a staple leg bending anvil surface also contiguous to the plane of said upper portion whereby the flap supported by the said upper portion remains substantially flat and the flap supported by said lower portion is guided upwardly into engagement with said first mentioned flap to be stapled.



2,101,661

AUXILIARY MOLDBOARD ATTACHMENT FOR PLOWS

Mann E. Wagler, Milwaukee, Wis., assignor to Hunter Tractor & Machinery Co., Milwaukee, Wis., a corporation of Wisconsin

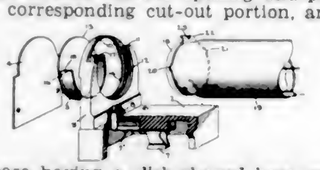
Application February 26, 1937, Serial No. 127,932

16 Claims. (Cl. 97—134)

13. A plow comprising a frame, a pair of main mold boards rigidly connected to the frame, and a pair of auxiliary mold boards disposed with at least their forward portions in overlapping engagement with the rear portions of the main mold board in all relative adjustments of the two, means floatably interconnecting the auxiliary mold boards with the frame to provide for the free vertical swinging movement thereof, and means for limiting the amount of free vertical swinging movement of the auxiliary mold boards.

2,101,662

SOCKET FOR TUBULAR LAMPS



Kurt Wiegand, Hohenneuendorf, near Berlin, and Alexander Koenig, Berlin-Charlottenburg, Germany, assignors to General Electric Company, a corporation of New York

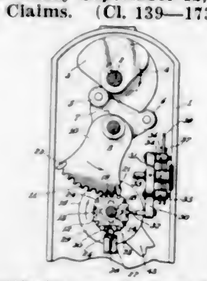
Application December 8, 1936, Serial No. 114,844

In Germany December 18, 1935

4 Claims. (Cl. 173—328)

1. A holder for an end of a double base lamp comprising an insulating wall member having an annular opening with a cut-out portion and an annular groove opposite said cut-out portion, a terminal contact located in the bottom of the groove of said wall member, an insulating sleeve rotatable in said annular opening and provided with a corresponding cut-out portion, and said lamp base having a disk-shaped base provided with a contact projecting from the periphery thereof into said groove of said wall member whereby rotation of the lamp effects closure of the cut-out in the wall member and closure of the circuit thereof.

2,101,663



SHUTTLE BOX MECHANISM FOR LOOMS

Georg Wiget, Arbon, Switzerland, assignor to Societe Anonyme Adolphe Saurer, Arbon, Switzerland, a corporation of Switzerland

Application August 12, 1936, Serial No. 95,542

In Germany September 12, 1935

4 Claims. (Cl. 139—173)

1. In a shuttle box mechanism for looms, the combination of a shuttle box, a reciprocating driving gear, a driven gear for engagement with the driving gear and having diametrically opposed tooth gaps, each of which permits idling movement of the driving gear, a special tooth at the end of the range of gear teeth of the driving gear, which special tooth is wider in an axial direction than the gear teeth and by which the rotation of the driven gear is completed to a half rotation, and operative connections from the driven gear to the shuttle box.

2,101,664

DIAZO SALT PREPARATIONS

Max Wyler, Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain

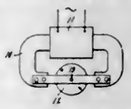
No Drawing. Application December 17, 1935, Serial No. 54,949. In Great Britain December 22, 1934

4 Claims. (Cl. 260—69)

2. The compound represented by the formula:

2,101,665

SYNCHRONOUS MOTOR



Ralph G. Arey, Swampscott, and Harold T. Faus, Lynn, Mass., assignors to General Electric Company, a corporation of New York

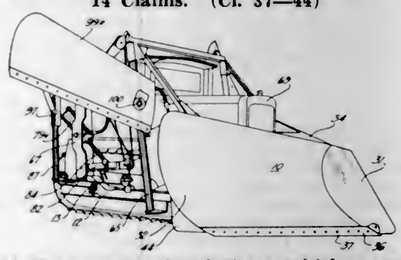
Application November 19, 1935, Serial No. 50,508

6 Claims. (Cl. 172—278)

1. A rotor element for synchronous motors

comprising a permanent magnet made of sintered

oxide which has a resistance above 500,000 ohms per cubic centimeter.



2,101,666

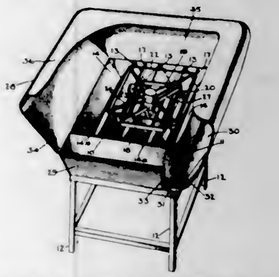
SNOW MOVING DEVICE

Ellsworth W. Austin, Cedar Rapids, Iowa, assignor to La Plant-Choate Manufacturing Company, Incorporated, Cedar Rapids, Iowa, a corporation of Delaware

Application January 2, 1936, Serial No. 57,091

14 Claims. (Cl. 37—44)

14. In a snow moving device, a vehicle, a scraper blade mounted for vertical movement with reference to the vehicle, and means for moving the scraper blade including supporting plates on the vehicle, a jack having the cylinder thereof pivotally engaged between the supporting plates, a lever arm pivotally engaged between the supporting plates at a point below the jack, a pivotal connection between the ram of the jack and the lever, and means for conveying movement of the lever to the scraper blade.



2,101,667

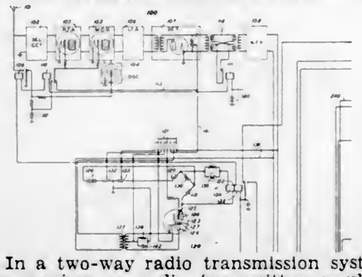
EXHAUST DEVICE

Henry J. Berman, River Forest, Ill., assignor to Edison General Electric Appliance Company, Chicago, Ill., a corporation of New York

Application May 16, 1935, Serial No. 21,839

6 Claims. (Cl. 15—15)

3. An exhaust device comprising an exhaust chamber, an openwork tray above said chamber, an openwork carriage supporting said tray, a track above said chamber supporting said carriage for longitudinal movement from the front to the rear of the chamber to carry the tray from the front to the rear, and means mounting said tray on said carriage for rotary motion on an axis substantially perpendicular to the plane of longitudinal movement of the tray.



2,101,668

RADIO COMMUNICATION SYSTEM

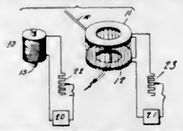
John B. Bishop, Bloomfield, and William M. Knott, Fairlawn, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application September 26, 1935, Serial No. 42,172

12 Claims. (Cl. 178—44)

5. In a two-way radio transmission system a radio receiver, a radio transmitter employing electric discharge devices, a source of power for energizing said devices, means responsive to the signal wave input of said transmitter for controlling an operative condition of said transmitter to render said transmitter operative for transmission of radio waves in the presence of a signal wave input and to prevent the transmission of radio waves in the absence of a signal wave input, time controlled means operative a predetermined time after the initiation of its operation to interrupt the supply of power from said source to said discharge devices, and means responsive to the cessation of signal input for initiating the operation of said time controlled means.

2,101,669



DEVICE FOR THE DEFLECTION OF ELECTRON BEAMS

Ernst Brüche and Walter Henneberg, Berlin-Reinickendorf-Ost, Germany, assignors to General Electric Company, a corporation of New York

Application August 5, 1935, Serial No. 34,852

In Germany August 22, 1934

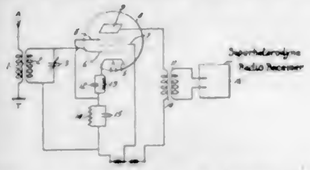
5 Claims. (Cl. 250—27)

5. An electron deflecting device comprising means producing in a region traversed by an electron beam a substantially homogeneous electrostatic field transverse to the beam for deflecting the same, and means including a concentrated magnetic field source displaced from the axis of the beam for producing in the region of beam deflection a non-homogeneous magnetic field substantially transverse to the electrostatic field and to the beam, said magnetic field being of such nature and magnitude as substantially to neutralize the focusing effects of the electrostatic field.

2,101,670

RADIO FREQUENCY AMPLIFIER

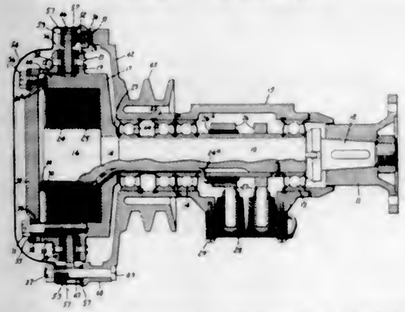
Maurice Byk and Jehan de Mare, Paris, France, assignors to General Electric Company, a corporation of New York



Application October 26, 1934, Serial No. 750,192

In France October 27, 1933

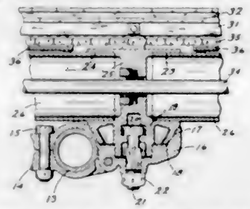
4 Claims. (Cl. 250—20)



1. In a superheterodyne radio receiver, an elec-

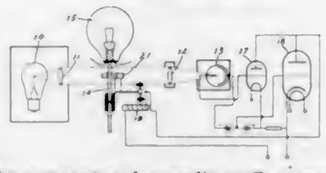
tron discharge amplifier having an anode, a cathode and two grids, the combination of an input circuit connected between said cathode and one of said grids, an output circuit connected between said cathode and anode, a connection between the other of said two grids and said cathode, said other grid being maintained at the potential of said cathode, means to tune said

amplifier for operation at a desired frequency, and means to reduce the transfer through said amplifier of energy having a frequency equal to the intermediate frequency of said receiver and received in said circuit between said one grid and said cathode, said means comprising a circuit tuned to said intermediate frequency connected in a common portion of both of said circuits and said connection.



2,101,671
MAGNETIC CLUTCH
La Mar S. Cooper, Erie, Pa., assignor to General Electric Company, a corporation of New York
Application May 5, 1936, Serial No. 78,006
10 Claims. (Cl. 192—84)

1. A magnetic clutch including a rotatable shaft, a central magnetic core carried by said shaft, a magnetic yoke mounted on said shaft, means including an armature mounted in an axially movable relation on and extending about said yoke for completing a magnetic circuit including said core and said yoke, a power transmitting member rotatably mounted about said shaft and surrounding said yoke, and means for magnetically operating said armature to provide a driving connection between said shaft and said power transmitting member.

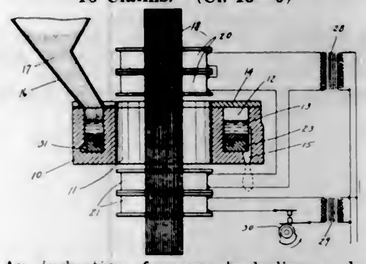


2,101,672
ROCK DRILL MOUNTING
John C. Curtis, Garfield Heights, Ohio, assignor to The Cleveland Rock Drill Company, Cleveland, Ohio, a corporation of Ohio
Application March 28, 1935, Serial No. 13,524
Renewed February 23, 1937
4 Claims. (Cl. 121—9)

1. A rock drill feeding and guiding mechanism comprising an elongated hollow frame, a duality of elongated members secured thereon in spaced relation with each other, a guideway within each of said members within which the drill is free to slide, a fluid actuated mechanism within said frame, a flexible member connecting said feeding mechanism to said drill

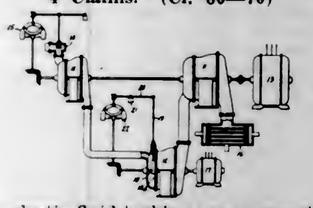
for transmitting the movement of the former to the latter, and a stationary element extending longitudinally between said elongated members, said element having a guideway within which said flexible member is free to slide.

2,101,673
SEALING-OFF APPARATUS
Michael de Neumann, Budapest, Hungary, assignor to General Electric Company, a corporation of New York
Application December 16, 1935, Serial No. 54,773
In Germany December 24, 1934
3 Claims. (Cl. 49—2)



1. An apparatus for sealing-off a vessel containing a gas under pressure greater than atmospheric and provided with a vitreous tube connected to said vessel which comprises a pair of jaws, means for heating a portion of said tube to cause it to become plastic and means actuated by the incipient change of shape of said tube due to the internal gas pressure for closing said jaws against the plastic tube to compress and close it.

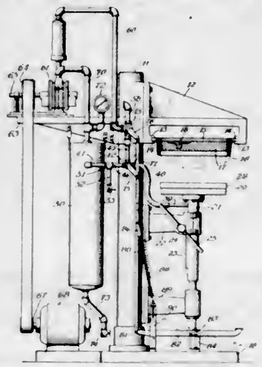
2,101,674
ANTENNA
Robert B. Dome, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application May 25, 1934, Serial No. 727,437
13 Claims. (Cl. 250—33)



1. The combination of an antenna of the type having a capacity area at the top and an inductance connected between said capacity area and the top of said antenna, and means whereby said inductance is produced by the open end of a transmission line closed at the end remote from said area.

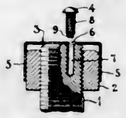
2,101,675
ELECTRIC FURNACE
John Ferguson, Indianapolis, Ind., assignor to Fairmount Glass Works, Incorporated, Indianapolis, Ind., a corporation
Application May 17, 1935, Serial No. 21,916
16 Claims. (Cl. 13—6)

1. An induction furnace including a hearth adapted to contain a charge of material, a primary winding supplied with alternating current, and a secondary conductor in heat exchange relation with the material on the hearth and inductively linked with the primary winding, said secondary conductor being in the form of a ring of relatively refractory resistance material having a core of less refractory conducting material of lower specific resistance.



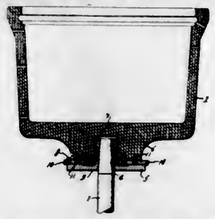
2,101,676
ELASTIC FLUID TURBINE CONTROL
Werner Guilhauman, Berlin-Steglitz, Germany, assignor to General Electric Company, a corporation of New York
Application August 8, 1936, Serial No. 94,962
In Germany September 19, 1935
4 Claims. (Cl. 60—70)

1. An elastic fluid turbine arrangement including the combination of a main turbine having a high pressure part and a low pressure part, an inlet valve for the high pressure part, a speed governing mechanism operated from the main turbine shaft for controlling the inlet valve, an auxiliary turbine connected in series between the high pressure part and the low pressure part to conduct all of the elastic fluid discharged from the high pressure part through the auxiliary turbine to the low pressure part, and means for automatically controlling the ratio of the pressure drop across the auxiliary turbine and the pressure drop across one of the main turbine parts in response to changes in load demand from either of said turbines.



2,101,677
APPARATUS FOR PRODUCING MOLDS
Henry F. Hagemeyer, Chicago, Ill., assignor to Castings Patent Corporation, Chicago, Ill., a corporation of Illinois
Application June 29, 1936, Serial No. 87,923
4 Claims. (Cl. 22—190)

1. Apparatus for withdrawing a mold from a match plate and a flask, which apparatus comprises means for supporting the match plate and the flask, a plate having a surface with a plurality of grooves therein, said grooved surface being engageable with a surface of the mold, means for creating a partial vacuum in said grooves

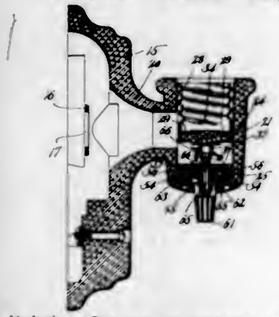


whereby said mold will adhere to said grooved plate when said grooved plate and said match plate are displaced relative to each other, and means for causing relative displacement between said grooved plate and said match plate.

2,101,678
NUT LOCK
Arthur J. Herschmann, New York, N. Y.
Application April 30, 1937, Serial No. 139,863
5 Claims. (Cl. 151—29)

1. In a nut lock, the combination with a standard bolt and nut, of a saddle having a substantially right-angled projection for engaging a flat of the nut, a pin-hole in the saddle eccentric to the axis of the bolt, said saddle and hole serving as a jig for drilling a hole in the end of the bolt, and a headed pin passing through the saddle hole into the drilled hole in the bolt end for securing the saddle in position over the nut, and said eccentrically seated pin locking the saddle and nut together against rotation on the bolt.

2,101,679
SPINNING BUCKET DRIVE
Edwin H. Hull, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application March 12, 1936, Serial No. 68,441
1 Claim. (Cl. 287—53)



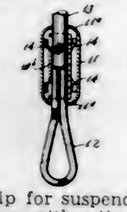
In a rayon spinning bucket drive, the combination of a vertical shaft, a flange on the shaft

spaced from the upper end thereof, a rayon spinning bucket having a hub provided with a bore which fits the end of the shaft and with a flat bottom surface which engages and rests on the top surface of said flange to support said bucket on the shaft end, radially outwardly extending driving lugs carried by the hub flush with the bottom surface thereof, and vertically extending ears projecting upwardly from said flange to engage said lugs to form a positive driving connection between said rayon spinning bucket and said shaft, the sides of said ears which are engaged by the sides of the lugs being undercut whereby they serve to prevent upward movement of said bucket on the shaft end but do not interfere with the ready removal of the bucket from the shaft end.

2,101,680

ELECTRIC LIGHT FIXTURE

Gustaf A. Johnson, New Bedford, Mass.
Application March 12, 1932, Serial No. 598,421
8 Claims. (Cl. 173—346)

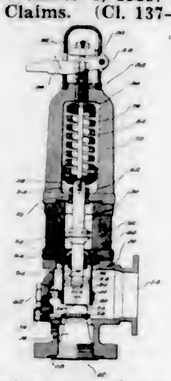


1. A lighting fixture comprising a cup portion having a circular opening in its base, a turn knob mounted loosely in the base of said cup portion and projecting outwardly through said opening, said turn knob having an annular flange on its inner end overlapping the inner edge of said opening for holding said turn knob within said cup, an electric lamp socket seated in said cup, the base of said lamp socket being recessed to accommodate the flanged end of said turn knob and to prevent upward movement thereof without interfering with its rotary movement, said lamp socket including a switch having a rotatable member for opening and closing it, said member having one end anchored in said turn knob to turn with it and means for fastening said lamp socket in said cup to hold said turn knob and operating member in operative position.

2,101,681

ATTACHING TIP FOR SUSPENDER CORDS

Lester J. Josephs, New York, N. Y.
Application November 3, 1936, Serial No. 108,946
6 Claims. (Cl. 241—27)

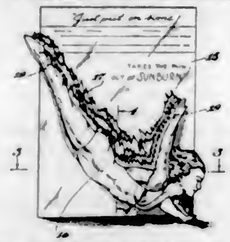


1. An attaching tip for suspender cords comprising in combination with adjacent cord ends, a metallic binder for holding said ends as a finished unit, a celluloid or the like tube engaging over and covering said binder, and elements on said binder engaging against the inner face of said celluloid tube to hold it in position.

2,101,682

RELIEF VALVE

Erling Klafstad, Melrose, Mass., assignor to Crosby Steam Gage and Valve Company, Boston, Mass., a corporation of Massachusetts
Application November 4, 1935, Serial No. 48,149
2 Claims. (Cl. 137—53)

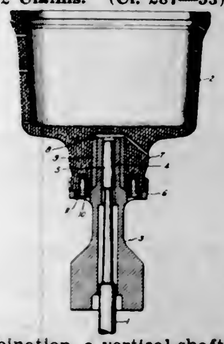


1. A relief valve comprising a housing, a valve disk, a cooperating seat, a tubular guide member surrounding and closely guiding the disk to compel straight line movement of the disk in a direction normal to the seat, a valve spindle sufficiently massive to avoid buckling under loading strain, a thrust bearing between the end of the spindle and the disk to permit rotative movement of the disk with respect to the spindle, a restraining member connected with the disk and spindle to prevent relative angular movements of the disk and spindle, spindle guides positioned adjacent opposite ends of the spindle to compel accurate movements of the spindle in a path aligned with that of the valve disk, and a loading spring engaging with the end of the spindle remote from the disk and beyond the outer spindle guide to impart a loading thrust thereto without affecting the predetermined path of movement of the spindle and connected valve disk.

2,101,683

ADJUSTABLE DISPLAY DEVICE HAVING A LUSTROUS PORTION

Nathan Joseph Leigh, Great Neck, N. Y., assignor to Einson-Freeman Co., Inc., Long Island City, N. Y., a corporation of Delaware
Application February 6, 1937, Serial No. 124,396
7 Claims. (Cl. 40—126)

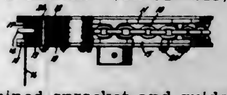


1. In a cardboard display device of the character described, an easel, a display panel consisting at least in part of lustrous light-reflecting material, and means for adjustably supporting the display panel on the easel at varying inclinations, so that said lustrous material may be brought into maximum reflective relation to the source of light illuminating the device.

2,101,684

SPINNING BUCKET DRIVE

Frank C. Linn, Swampscott, Mass., assignor to General Electric Company, a corporation of New York
Application March 12, 1936, Serial No. 68,465
2 Claims. (Cl. 287—53)

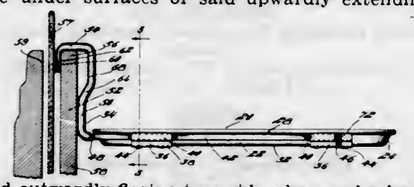


1. In combination, a vertical shaft, a flange on the shaft having openings therein under-cut at their ends, a member to be rotated having a portion which fits over the end of the shaft and engages the flange, and projections on said portion which extend into said openings, said projections being under-cut to engage with the under-cut ends of the openings, and said flange having sloping surfaces for directing the projections into said openings.

2,101,685

COMBINED SPROCKET AND GUIDE WHEEL

Archibald W. Nisbet, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application October 16, 1936, Serial No. 105,856
4 Claims. (Cl. 74—243)



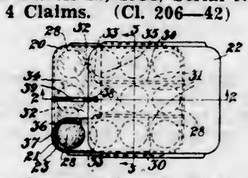
1. A combined sprocket and guide wheel comprising a body having widely spaced radially extending open ended rectangular slots therein having parallel sides and cylindrical portions between the slots which cover a greater arc of the circumference of the body than the slots and form guide surfaces for a co-operating chain, a nonmetallic member having parallel sides filling each of the slots and having a circumferential groove and a chain engaging tooth formed therein, parts of which are located on opposite sides of the groove, said tooth projecting radially outward by a sufficient amount to hold the co-operating chain out of contact with the body, and means for rigidly securing the members to the body.

2,101,686

SERVICE TRAY

Bernard M. Offutt, West Barrington, R. I.
Application May 17, 1935, Serial No. 22,008
14 Claims. (Cl. 311—22)

11. A rectangular curb service tray having a base having an under surface having upwardly extending and outwardly flaring side and end edges terminating in a rolled over bead and a substantially flat portion interiorly of said upwardly extending and outwardly flaring edges, whereby a plurality of said trays may be telescopically stacked and spaced supporting means each having a rigid shank portion of less height than said edges pivotally mounted on the upper portions of the under surfaces of said upwardly extending

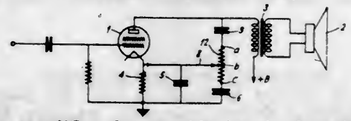


and outwardly flaring tray side edges and a hook portion projecting from one end only of said tray pivotable from a substantially vertical position for horizontal mounting of said tray on a support edge to a horizontal position so that said trays may be stacked in partially nested relationship with the distances between vertically adjacent portions of said trays less than the depths of said trays.

2,101,687

DISPENSING CONTAINER

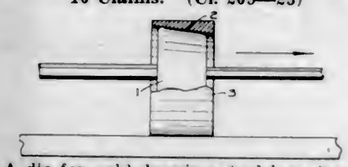
Leon R. Paul, Brooklyn, N. Y., assignor of one-half to George J. Atwell, New York, N. Y.
Application March 12, 1934, Serial No. 715,064
4 Claims. (Cl. 206—42)



1. A dispensing container for tablets and the like, comprising a box having a plurality of compartments of equal capacity and adapted to accommodate the same number of tablets, all of said compartments having outlet openings at the same end of the box, a cover for the box, and fixed cover means in the box for preventing the exposure of the outlet end of one compartment upon opening of the first said cover to discharge tablets from another compartment.

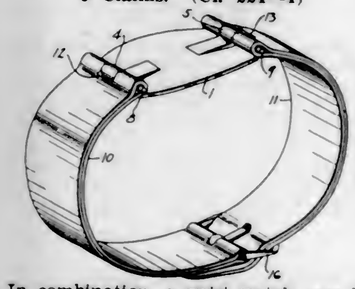
2,101,688

TONE CONTROL DEVICE



Rudolf Rechnitzer, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application September 11, 1935, Serial No. 40,027
In Germany August 21, 1934
1 Claim. (Cl. 179—171)

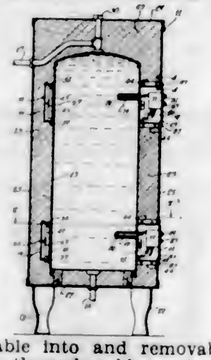
An amplifier for a wide band of audio frequency currents comprising in combination, a vacuum tube having a cathode, a control grid and a plate, an input circuit connecting said cathode and control grid, an output circuit connected to said plate, a resistor common to said input and output circuits, a condenser shunted



across said resistor, a series circuit including two separated condensers and a central resistor connected between the plate and the low potential end of said first named resistor and a conductive connection between an intermediate point of said central resistor and said cathode.

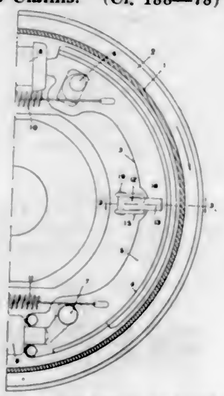
2,101,689
DRAWING DIE
Harry Hamilton Richardson, Hamilton, Ontario, Canada
Application July 3, 1936, Serial No. 88,868
10 Claims. (Cl. 205—25)

1. A die for cold drawing steel bars into polygon shapes comprising a housing, a single die sector holding ring inserted into the housing, a plurality of substantially sector shaped portions assembled in the die sector holding ring with their radial faces abutting each other and their bar engaging faces forming an opening of the polygonal shape of the bar to be drawn therethrough, said die sector holding ring being operable longitudinally with respect to such sector shaped portions, and retaining means adjustably disposed in the housing and engaging the die sector holding ring.



2,101,690
WRIST WATCH GUARD
Albert H. Sauer, Jr., Cincinnati, Ohio
Application May 26, 1934, Serial No. 727,773
6 Claims. (Cl. 224—4)

3. In combination, a wrist watch case having a detachable pin bar at each end thereof, a leather guard upon the lower surface of the watch case and having an eye at each end thereof adapted to be pivotally mounted on said pin bars respectively, and a wrist watch strap having ends provided with eyes also adapted to be pivoted on said pin bars in cooperative relation with said guard.



2,101,691
ELECTRIC WATER HEATER
Frank W. Scharf, Western Springs, Ill., assignor to McGraw Electric Company, Chicago, Ill., a corporation of Delaware
Application November 29, 1935, Serial No. 52,024
13 Claims. (Cl. 219—39)

1. A water heater assembly for a tank, including an annular compartment around the tank having top, bottom and outside walls and an opening in the outside wall and a flexible multi-element electric heater located in the compart-

ment insertable into and removable from the compartment through said opening, and means to clamp said heater around said tank.

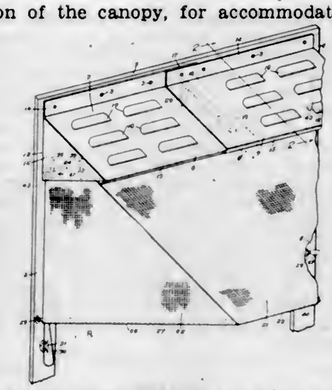
2,101,692
BRAKE SHOE GUIDE
Steve Schnell, Overland, Mo., assignor to Wagner Electric Corporation, St. Louis, Mo., a corporation of Delaware
Application September 12, 1935, Serial No. 40,197
10 Claims. (Cl. 188—78)

1. In a brake construction, a support, a brake shoe mounted thereon, and resilient guiding means for said shoe, said guiding means comprising a pair of yieldable elements having end portions contacting opposite sides of a portion of the brake shoe, means for securing the other end portions of the yieldable members to the support, and means for preventing said elements from moving toward each other, said elements being unrestrained from relative movement away from each other under the influence of movement of the shoe.

2,101,693
SHOE STRUCTURE
Joseph Taraci, East Elmhurst, Long Island, N. Y.
Application April 16, 1935, Serial No. 16,569
2 Claims. (Cl. 36—12)

1. A shoe comprising a shank piece having its entire bottom marginal edge portion skived and being provided at its forward edge with forward extensions, an outer sole having its entire top marginal edge portion, skived, and an upper having its lasting allowance skived, the lasting allowance of the upper being turned inwardly beneath, and attached to the skived heel and side portions

of the shank piece, and the skived portions of the outer sole being disposed beneath and attached to the inwardly turned, skived, lasting allowance of the upper entirely around the shoe.

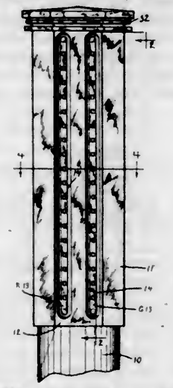


2,101,694
SPRINKLER HEAD
Emil Tyden, Hastings, Mich.
Application October 10, 1936, Serial No. 105,000
10 Claims. (Cl. 299—121)

10. A sprinkler having a base with a nozzle therethrough for discharge of a fire extinguishing medium, and a deflector fixedly mounted over said nozzle having a substantially flat portion extending obliquely with respect to the axis of the nozzle, the structure including an arm interposed in the path of flow from the nozzle to the deflector and having a surface presented obliquely to the direction of said flow for deflecting the discharge of the medium as it approaches the deflector.

2,101,695
AWNING STRUCTURE
Edgar S. Waddell, Cincinnati, Ohio, assignor to The Randall Company, Cincinnati, Ohio, a corporation of Ohio
Application September 15, 1936, Serial No. 100,903
11 Claims. (Cl. 156—43)

1. In an awning structure which includes a ventilated canopy extensible in the direction of its length for accommodating aperture frames of various widths, the combination of a sheet of flexible awning material and a supporting frame therefor movable to a collapsed awning position at which the sheet of awning material enters beneath the canopy for protection from the elements, said canopy including a series of awning sheet supports in the form of hooks having elongated shank portions extending between the forward portion and the rear portion of the canopy, and upon which the upper portion of said sheet may slidably shift, to yield space at the forward portion of the canopy, for accommodating the



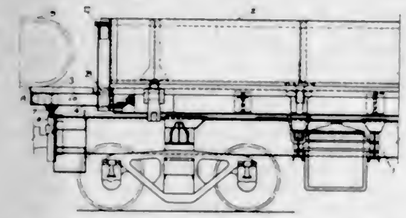
awning sheet beneath the canopy when collapsed.

2,101,696
PROCESS FOR PRODUCING TWO-COLOR EFFECTS ON SKINS OR FURS
Heinrich Wagner, Mannheim, and Max Zabel and Alfred Ensslin, Dessau in Anhalt, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application November 26, 1935, Serial No. 51,600. In Germany December 15, 1934
4 Claims. (Cl. 8—5)

1. The process which comprises treating a fur or pelt in a chromium modanting bath, tipping or spotting the mordanted hairs with an agent of the group consisting of alkali metal carbonate and alkali metal bisulfite for removing the mordant, rinsing the pelt and dyeing it with an oxidation dye yielding different colorations on the mordanted and unmordanted places.

2,101,697
TRAFFIC SIGNAL SYSTEM
Charles B. Watson, Omaha, Nebr., assignor of forty-nine percent to Fay G. Johnson, Omaha, Nebr.
Application January 17, 1935, Serial No. 2,232
4 Claims. (Cl. 177—329)

1. In a traffic signal system for controlling traffic at street intersections and the like, the combination, a signal support, a plurality of extended electrically illuminable indicators on the



support, said indicators being straight and in parallel association relative to each other, the respective indicators being of different colors and adapted to illuminably and colorably control the flow of traffic by alternately signaling traffic to stop and proceed, each of said tubes being adapted to be illuminated the full extent thereof and to have the illuminated portion progressively decreased in extent, and distributing means adapted to distribute electric current from a suitable source of electric supply to the indicators and to illuminate alternately the stop and proceed indicators and to progressively decrease the extent of the respectively illuminated portions thereof, and in respect to indicators facing the same line of traffic said indicators being alternately illuminated their full length while a portion of a previously illuminated indicator is still illuminated.

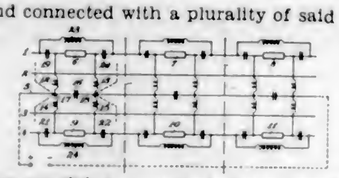
2,101,698

CAR CONSTRUCTION

John P. Anderson, Koppel, Pa., assignor, by mesne assignments, to Pressed Steel Car Company Inc., Pittsburgh, Pa., a corporation of Pennsylvania

Application December 15, 1933, Serial No. 702,533
7 Claims. (Cl. 105—276)

1. In a vehicle of the character described, in combination, an underframe, a movable body, transversely spaced supports beneath the body and engaging the underframe adjacent each end of the latter, hinged end walls for the body adapted to overlie the underframe and overhang the adjacent end thereof when in lowered position, load sustaining members secured to the outer face of the end walls, a support for each said member when in lowered position comprising a depending member pivotally connected to the load sustaining member and engaging the underframe adjacent the end thereof, and lugs extending outwardly from opposite sides of the depending member to limit relative pivotal movement between the depending and load sustaining members.



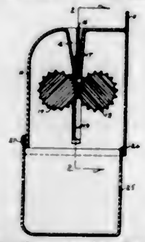
2,101,699

ALTERNATING CURRENT SIGNALING SYSTEM

Martin Baesecke, Berlin-Siemensstadt, and Hans Mayer, Berlin-Charlottenburg, Germany, assignors to Siemens & Halske, Aktiengesellschaft, Siemensstadt, near Berlin, Germany, a corporation of Germany

Application May 26, 1934, Serial No. 727,606
In Germany May 30, 1933
14 Claims. (Cl. 178—45)

1. A signaling system comprising lines for signal transmission, said lines extending from a transmitting station to a receiving station, negative resistances connected in these lines at different distances from the ends of the lines, for reducing the loss of signal energy, and a special line extending lengthwise of the signaling system and connected with a plurality of said signal



lines for supplying currents to bias the negative resistances.

2,101,700

CRUSHER FOR USED SAFETY RAZOR BLADES

Guy E. Chesnut, Jr., St. Joseph, Mo.

Application October 8, 1936, Serial No. 104,636
3 Claims. (Cl. 29—66)

1. In a crusher for used safety razor blades, a housing, a hopper in the upper portion of said housing, two longitudinally parallel rollers rotatably mounted in said housing positioned below said hopper, a means for manually rotating said rollers, teeth on said rollers, a vertical slot opening in one side of said hopper, and a vertical razor blade guide bar in said housing and back of said slot opening.

2,101,701

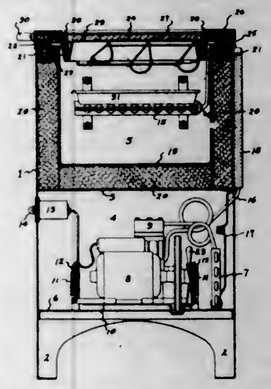
SLEEPING GARMENT

Leonard Cohen, New York, N. Y.

Application December 21, 1936, Serial No. 116,863
3 Claims. (Cl. 2—83)

1. In a device of the character described, a sleeping garment, buttoning means associated with the upper back and the upper front of said garment, blanket-like means adapted to extend across the back around to the front and across the front of said garment, and cooperating buttoning means associated with said blanket-like means and positioned to register respectively with said buttoning means which are associated with said garment.

2,101,702



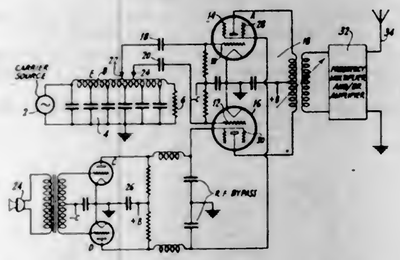
CABINET FOR MECHANICAL REFRIGERATORS AND APPURTENANCES THEREOF

Lewis M. Crosley, Cincinnati, Ohio, assignor to The Crosley Radio Corporation, Cincinnati, Ohio, a corporation of Ohio

Application November 14, 1934, Serial No. 753,012
5 Claims. (Cl. 312—173)

4. In combination, a hinged upwardly opening refrigerator door, a shelf member in operative

connection therewith, said shelf member having a part underlying and acting as a support for articles thereon when said door is open, and another part underlying and acting as a support for



articles thereon when said door is closed, said last mentioned part having a reentrant portion preventing accidental dislodgment of said articles when said door is closed.

2,101,703

PHASE MODULATION RECEIVER

Murray G. Crosby, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Original application January 23, 1932, Serial No. 588,309, now Patent No. 2,081,577, dated May 25, 1937. Divided and this application October 1, 1936, Serial No. 103,505
6 Claims. (Cl. 250—20)

1. In a phase modulation signalling system the method of demodulating carrier wave energy the phase of which has been modulated in accordance with signals which includes the steps of, collecting phase modulated wave energy, heterodyning said wave energy to a lower frequency to increase the percentage of frequency spread between the carrier and sideband energy of said lower frequency, limiting the amplitude of said wave energy of lower frequency, producing unmodulated energy characteristic of said carrier of said lower frequency limiting the amplitude of said produced unmodulated energy and combining said limited unmodulated energy with amplitude limited sideband energy of said lower frequency in substantially phase quadrature relation to produce resultant energy characteristic of the phase modulations on said collected energy.

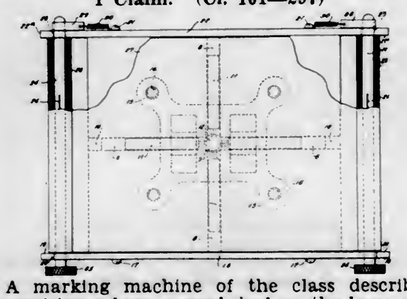
2,101,704

INSECTICIDAL COMPOSITION

Charles Dangelmajer, Niagara Falls, N. Y., assignor to The E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 26, 1934, Serial No. 727,721
15 Claims. (Cl. 167—16)

1. A process for preparing a solid cuprous cyanide composition which is readily suspended in water to form an agricultural spray liquid which comprises precipitating cuprous cyanide in the presence of a finely divided, substantially insoluble, solid material which is substantially chemically inert to the other substances present and mixing the moist precipitate with a protective colloid.



5. A process for preparing a solid cuprous cyanide composition which is readily suspended in water to form an agricultural spray liquid which comprises precipitating cuprous cyanide by reacting a soluble cyanide with a solution of a cuprous salt in the presence of powdered kaolin, washing the precipitate to remove electrolytes and mixing the moist precipitate with a protective colloid.

2,101,705

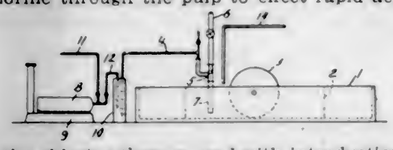
MARKING MACHINE

Charles F. Eaton, West Newbury, Mass., assignor, by mesne assignments, of one-half to North American Holding Corporation, Syracuse, N. Y., a corporation of New York, and one-half to Parshad Holding Corporation, Syracuse, N. Y., a corporation of New York

Application May 10, 1935, Serial No. 20,882
1 Claim. (Cl. 101—297)

A marking machine of the class described, comprising a base, a work-bed on the base, said work-bed having a plurality of radially disposed heating chambers, a heating coil disposed in each chamber, the coils being collectively operable to maintain the surface of said work-bed at a predetermined temperature, and a platen movably mounted on the base to move toward and from the work-bed, the work-bed being yieldingly mounted on the base so as to be capable of a slight lateral displacement with relation to the platen when the platen and the work-bed are pressed together with the work between them.

2,101,706



BLEACHING OF PULP

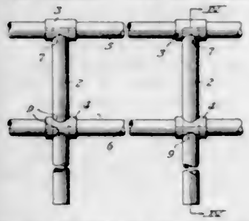
John Alden Extrom, Tomahawk, Wis., and Hoke Martin, Chicago, Ill.; said Extrom assignor to Tomahawk Kraft Paper Company, Tomahawk, Wis., a corporation of Wisconsin and said Martin assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of Virginia

Application February 4, 1936, Serial No. 62,372
5 Claims. (Cl. 8—2)

1. The method of bleaching pulp which com-

prises introducing separately and continuously into the pulp being bleached chlorine and hydrated lime with intimate distribution of the chlorine through the pulp to effect rapid action

of the chlorine thereon, and with introduction of the lime in close proximity so that it is admixed with the pulp which has been previously admixed with the chlorine, and so that it neutralizes acids formed in the chlorine treatment.



2,101,707

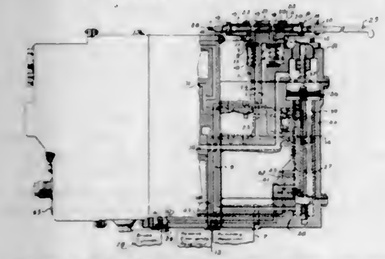
RAILING AND MANUFACTURE THEREOF

Wylie B. Ewing, Wheeling, W. Va., assignor, by mesne assignments, to Vulcan Rail and Construction Company, Maspeth, N. Y., a corporation of New York

Application November 6, 1934, Serial No. 751,717

21 Claims. (Cl. 29—148.2)

1. A method of making railing, comprising assembling a plurality of railing members, welding the same together, and thereafter assembling with said welded members at least one other railing member to form a railing structure and cover so as to conceal from without the weld between said first mentioned members.



2,101,708

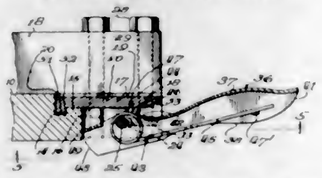
AIR BRAKE MECHANISM

Alva L. Goodknight, Fort Worth, Tex.

Application September 18, 1937, Serial No. 164,429

9 Claims. (Cl. 303—80)

1. In an air brake mechanism, in combination, a brake pipe, a brake cylinder, and an auxiliary reservoir adapted to be charged with fluid under pressure from the said brake pipe to effect a service application of the brakes, a reserve-emergency reservoir adapted to be charged from the said auxiliary reservoir and fluid under pressure from the said brake pipe to effect the emergency application, duplex reservoir pressure bleed-release valves for venting both reservoirs to the atmosphere, a manually slidable anti-friction cam plate and anti-friction cam means between the said valves and the said plate for rolling open the said valves in a predetermined sequence when the said plate is actuated, and means for holding the anti-friction means in operation assembly.



2,101,709

BENCH SAW RIP FENCE

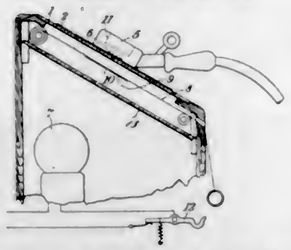
Theron L. Hedgpeth, Oak Park, Ill., assignor to Duro Metal Products Company, Chicago, Ill., a corporation of Illinois

Application March 31, 1937, Serial No. 133,959

4 Claims. (Cl. 143—174)

1. In a rip fence for saw tables, the combination of a table having a guide groove, an upwardly extending guide flange, with a rip fence having a downwardly extending flange adapted to be slidably mounted in said groove, said rip fence being slidably mounted on said first-mentioned flange, said rip fence having a handle pivotally mounted thereon, said handle having a pointed end engaging the edge of said table, and spring means for rotating said handle in such manner as to bring said pointed end into engagement with the edge of said table, said pointed end being of such length as to effect a toggle action between said handle at the pivot thereof and the pivot provided by the point of said end.

2,101,710



APPARATUS FOR MEASURING THE REGION OF DENSITY OF A NEGATIVE

Karl Huber, Munich, Germany, assignor to Agfa Ansco Corporation, Binghamton, N. Y., a corporation of New York

Application March 16, 1935, Serial No. 11,407

In Germany March 17, 1934

3 Claims. (Cl. 88—14)

1. In an apparatus for measuring the printing properties of a negative in combination, a casing, a transparent pane in said casing, a small area marked on said pane, a source of light for illuminating said pane, a casing containing a photo-electric cell, a further marked area on said pane corresponding with the outlines of said casing containing a photo-electric cell, so that when bringing said casing into register with said second marked area, said photo-electric cell is in correct register with said small area.

2,101,711

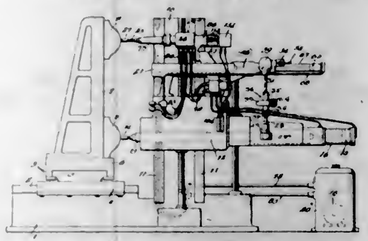
TRANSPORTATION SYSTEM AND APPARATUS

Jesse P. Hubbell, Fanwood, N. J.

Application May 23, 1936, Serial No. 81,405

15 Claims. (Cl. 105—215)

1. The combination with railway track rails having tread surfaces at a level above the railway road bed and adapted to support and guide ordinary railway cars and locomotives, of a motor vehicle adapted for movement optionally on said track rails and on a trackless roadway, and having flanged wheels adapted to run on said track rails and unflanged wheels adapted to run on a trackless roadway and support the vehicle with its flanged wheels above and out of engagement with said roadway, and including vehicle steering mechanism, said road bed including a hump comprising elevated portions alongside localized portions of the track rails and adapted to be engaged by said unflanged wheels and to support the vehicle with its flanged wheels above the track rail tread surfaces, and means including cooperative railway road bed carried parts and vehicle carried parts adapted to automatically lock said steering mechanism for straight line vehicle movement as the vehicle moves off said hump onto the track rails, and to control said steering mechanism as required for movement of the vehicle in the direction of the track rails while the flanged vehicle wheels are held above the track rail tread surfaces by said hump.



2,101,712

TRACER MECHANISM FOR DUPLICATING MACHINES

Einar K. Johansen, Chicago, Ill., assignor to Clearing Machine Corporation, Chicago, Ill., a corporation of Illinois

Original application January 27, 1937, Serial No. 122,608. Divided and this application June 21, 1937, Serial No. 149,370

11 Claims. (Cl. 90—62)

1. In a tracer mechanism, in combination, an elongated hollow casing structure, a valve actuating member supported in one end of the casing for endwise movements relative to the casing, a tracer arm pivotally connected to said member and projecting through the other end of the casing, said arm having a tip adapted to engage the surface of a pattern, a bearing element having a spherically formed bearing surface carried by said arm adjacent said other end of the casing and adapted to co-operate with a second bearing element supported on the casing, said second bearing element having a bearing surface disposed at an angle to the axis of the casing whereby lateral deflections of the tracer arm and tip are operative to produce an axial movement of the arm and endwise movement of said valve actuating member, and yielding means tending normally to center said bearing elements one with respect to the other.

2,101,713

ELECTRIC CONNECTER OR TERMINAL

John J. Jolliffe, Hawthorne, N. J., assignor to The Okonite Company, Passaic, N. J., a corporation of New Jersey

Application April 25, 1936, Serial No. 76,327

2 Claims. (Cl. 173—322)

1. In combination an electric utensil attachment plug comprising a block divided longitudinally into two sections, contacts within said block, an electric cord, rigid metal terminals attached to the ends of the conductors of said cord, a block of insulating material moulded about the terminal end of said cord and the ends of said rigid metal terminals which are attached to said conductors to entirely enclose the joint between the conductors and terminals, leaving the free ends of said rigid terminals exposed, means for rigidly attaching the exposed free ends of said rigid terminals to said contacts within said sectional block, said moulded block being clamped between the sections of said sectional block against movement relative thereto, and said moulded block preventing twisting of said conductors relative to said rigid terminals.

2,101,714

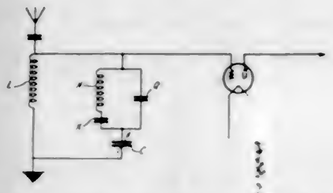
RUBBER COATED ARTICLE AND METHOD OF MANUFACTURING SAME

Arthur J. Keeney, Cuyahoga Falls, Ohio

Application February 15, 1935, Serial No. 6,665

4 Claims. (Cl. 91—68)

1. That method of coating wood with rubber



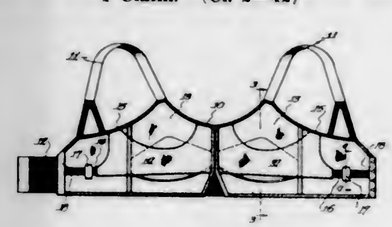
which consists of first applying a coating of lacquer to the wood, permitting the same to partly congeal, then adding a coating of rubber to the coating of lacquer while the same is in a partly congealed condition, subjecting the coating to heat and sulphur chloride fumes then simultaneously cooling and vulcanizing the coating.

2,101,715

SELECTIVE CIRCUIT ARRANGEMENT

Ernst Klotz, Karl Wilhelm, and Hans Otto Roosenstein, Berlin, Germany, assignors to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application December 21, 1934, Serial No. 758,558
In Germany December 28, 1933
4 Claims. (Cl. 250—20)



1. A filter circuit for radio frequency currents comprising a pair of output terminals, a connection conductive to direct current between said terminals and including an inductance coil, a circuit connecting said terminals and including the series connection of a fixed and a variable condenser, and the series connection of a coil and a condenser shunted across the terminals of said fixed condenser.

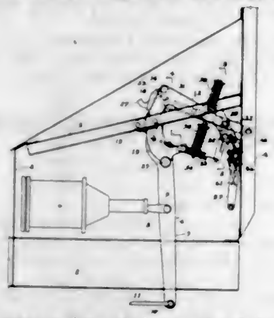
2,101,716

BRASSIÈRE

Sigmund W. Kunstadter, Chicago, Ill., assignor to The Formfit Company, Chicago, Ill., a corporation of Illinois

Application February 15, 1937, Serial No. 125,807
1 Claim. (Cl. 2—42)

A brassière having bust pockets; hammock-like supporting members loosely mounted in said pockets and attached to the brassière at their ends and at their outer top extremities, the outer attachment of each supporting member being in the form of an elastic strip; and a guide member for each of said elastic strips secured to the brassière body.



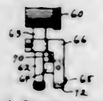
2,101,717

CAR BRAKE

Benjamin F. Kurtz, Bellevue, Pa., assignor to Pressed Steel Car Company, Inc., Pittsburgh, Pa., a corporation of Pennsylvania

Application August 25, 1936, Serial No. 97,808
17 Claims. (Cl. 188—195)

1. In an empty and load brake rigging of the character described, in combination, a brake lever, a brake lever hanger, a pivotal connection between the brake lever and brake hanger, a support for the brake hanger, a fulcrum member for selective engagement with the lever and hanger to vary the effective length of the brake lever and



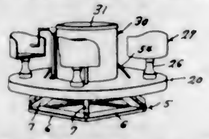
resilient means for retaining the fulcrum member in selected position.

2,101,718

INDICATOR GAUGE

Harry W. Moore, Greene County, Ohio

Original application July 13, 1933, Serial No. 680,225. Divided and this application June 13, 1936, Serial No. 85,105
4 Claims. (Cl. 33—172)



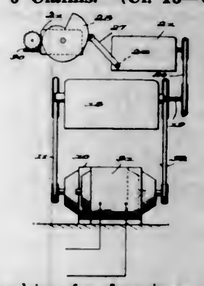
1. An attachment for a gauge having a smooth reciprocatory stem for actuating the gauge to measure movement of the stem in one direction, said attachment including a pair of substantially L-shaped members, the legs of one being longer than the legs of the other, said members being pivotally interconnected with the legs of one member extending substantially parallel to the legs of the other, one leg of one member fixedly supporting said attachment on the gauge, the corresponding leg of the other member engaging the stem of the gauge, and releasable means for causing the leg engaging the stem to prevent movement of the stem in one direction but permitting movement of the stem in the opposite direction.

2,101,719

MERRY-GO-ROUND

Henry J. Niebuhr, Lewiston, Idaho

Application August 7, 1936, Serial No. 94,850
1 Claim. (Cl. 272—48)



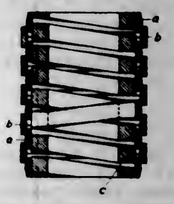
A merry-go-round of the class described comprising a base, an upstanding shaft fixedly secured centrally of said base, a platform rotatably mounted on said shaft, a bevelled gear fixedly secured to the upper portion of said upstanding shaft, an upstanding support on said platform, a horizontally disposed rotatably mounted shaft on said platform having a pinion gear on one end thereof in mesh with the bevelled gear, a hollow tubular member rotatably and slidably mounted in said upstanding support having the free end of said horizontally disposed shaft extending therein, clutch means on the inner end of said tubular member and on said horizontally disposed shaft cooperable for rotating said horizontally disposed shaft, a handle on the outer end of said tubular member, and resilient means disposed within said tubular member abutting the free end of said horizontally disposed shaft for normally maintaining said clutch elements out of engagement.

2,101,720

MANUFACTURE OF ARTIFICIAL SILK

Leon H. Ryan, New Castle, Del., assignor to Delaware Rayon Company, New Castle, Del., a corporation of Delaware

Application April 30, 1936, Serial No. 77,265
6 Claims. (Cl. 18—8)



2. In a machine for forming artificial silk or the like, the combination of thread-forming means, a spinning bucket to receive the thread to form a cake, a motor for driving said bucket, and means for changing the frequency of the electricity supplied to the motor whereby to change the speed thereof during the spinning of the cake.

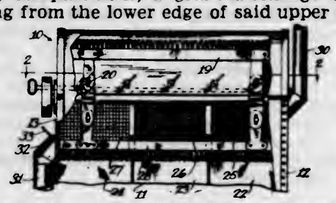
2,101,721

SPRING

Karl Scharfenberg, Berlin-Nicolassee, Germany

Application February 4, 1936, Serial No. 62,357
In Germany June 3, 1935
9 Claims. (Cl. 267—61)

1. A composite spring comprising, in combination, a helical spring and an annular radially contractile spring around said helical spring, said helical spring having a plurality of spaced apart axially compressible convolutions engaging said annular radially contractile spring to exert pressure thereon.



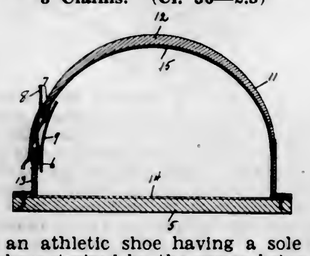
2,101,722

BOLTING MACHINE

Edward Schultz, Evansville, Ind.

Application September 24, 1935, Serial No. 41,909
4 Claims. (Cl. 209—283)

1. A grain bolting machine comprising a housing, a fixed screening means of increasing mesh dividing said housing into an upper agitating compartment and a plurality of lower receiving compartments, partition means separating said lower compartments from each other, a grain agitating brush journaled in said upper compartment, a grain inlet conduit leading into said agitating compartment, a grain discharge conduit leading from the lower edge of said upper agitating compartment, a weighted valve pivoted at the entrance of said discharge conduit, and a plurality of adjustable cleaning blades in said agitating compartment in the path of rotation of said agitating brush.

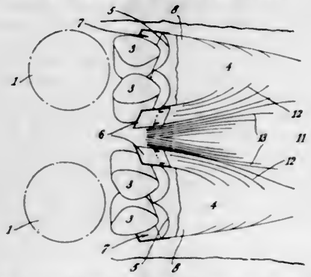


2,101,723

ATHLETIC SHOE

Elmer Smith, Shreveport, La.

Application July 6, 1937, Serial No. 152,205
3 Claims. (Cl. 36—2.5)

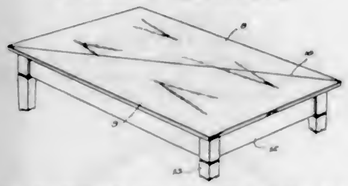


1. In an athletic shoe having a sole and an upper, characterized by the upper being thicker over the instep and unobstructed to receive the impact of a football, and lacings at the side of the shoe.

2,101,724

AIR COOLED AERO ENGINE

Hubert Charles Henry Townend, Teddington, England, assignor to Boulton Paul Aircraft Limited, Norfolk, England

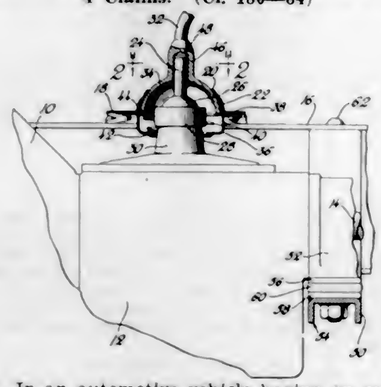


Application May 12, 1936, Serial No. 79,362
In Great Britain May 13, 1935
6 Claims. (Cl. 123—171)

1. The combination with an air-cooled aero engine having at least one cylinder and having a rear surface of the cylinder, said rear surface being determined relative to the direction of flight, of an air deflecting member having two concave surfaces facing the direction of flight, facing the rear surface of the cylinder, spaced apart from said rear surface and located

one at each side of a center plane extending in the direction of flight and containing the axis of the cylinder, said concave surfaces extending approximately between said center plane and outer planes extending in the direction of flight and tangential to the cylinder walls at diametrically opposite sides and a forwardly extending member at each side of said air deflecting member and inclined slightly to the said outer plane and adapted to receive air flowing near the cylinder and along the said outer plane and direct it to the air deflecting member whereby it is deflected inwardly and forwardly toward the rear of the cylinder.

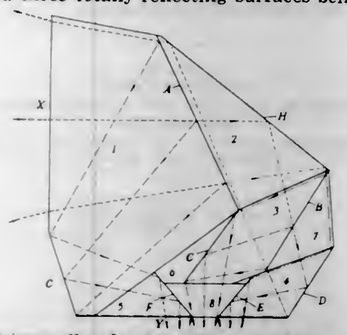
2,101,725
TABLE TOP
Joseph Traficante, Hoboken, N. J.
Application January 25, 1937, Serial No. 122,255
2 Claims. (Cl. 311—41)



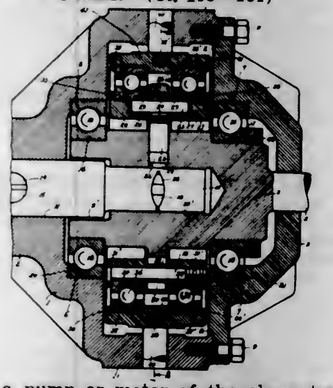
1. An extensible top member for an article of furniture comprising a pair of panels jointly defining a top of substantially rectangular outline, the line of juncture of said panels being diagonal of said rectangle, said panels being separable along said diagonal line to admit therebetween a top leaf to effect the prolongation of certain edges of said top to increase its size in one direction only.

2,101,726
MANUFACTURE OF MOLDS USED FOR CASTING METAL PIPES AND THE LIKE BY THE CENTRIFUGAL METHOD
Antonius J. van Zijp, Haarlem, Netherlands, assignor to Koninklijke Nederlandsche Hoogovens en Staalfabrieken N. V., Ijmuiden, Netherlands
Application October 7, 1935, Serial No. 43,954
In the Netherlands October 11, 1934
2 Claims. (Cl. 22—17)

2. In a pipe molding apparatus the combination with an upright flask, of a former extending therethrough and provided with cylindrical end sections of the same diameter as the finished article, a cylindrical middle section of smaller diameter and intermediary sections gradually tapering from the larger to the smaller sections, a jolting device at the lower end of the former, a hopper for sand at the upper end of the flask, an annular ram in said hopper fitting loosely around the upper end of the former and means for axially displacing said former; whereby, while the flask is being filled with sand from the hopper, the sand becomes compressed in axial direction of the apparatus by the jolting device and finally radially compressed upon displacement of said former.



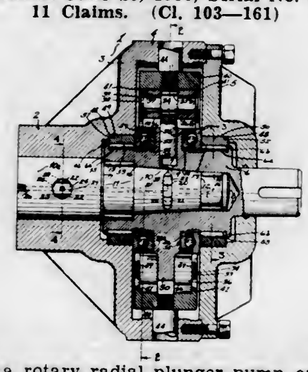
2,101,727
GEAR SHIFT LEVER MOUNTING
Benjamin H. Anibal, Pontiac, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 30, 1936, Serial No. 103,264
4 Claims. (Cl. 180—64)



1. In an automotive vehicle having an engine and a transmission connected to the engine, a floor, one lever only mounted on the transmission and projecting toward the floor, a shifting lever mounted on the floor adjacent the transmission and capable of engaging the first mentioned lever to operate the transmission, the connection between said two levers including a clearance to enable the engine and transmission to move in all directions relative to the floor without affecting the shifting lever.

2,101,728
PRISM COMBINATION FOR THREE COLOR PHOTOGRAPHY AND CINEMATOGRAPHY
Leonard Bellingham, Frank Stanley, and Gilbert Frank Stanley, London, England
Application February 8, 1937, Serial No. 124,768
In Great Britain April 15, 1935
6 Claims. (Cl. 88—1)

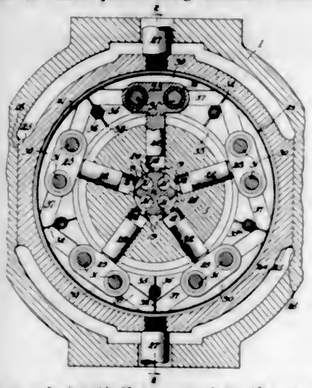
1. A three color prism combination for color photography and cinematography comprising a multiplicity of prism members cemented together to provide a composite prism having an entrance face and an exit face disposed at right angles to one another and including two successively acting partially reflecting and partially transmitting surfaces disposed in the angle formed between said faces for dividing a beam entering said entrance face into three component beams; three totally reflecting surfaces for deflecting said beams toward said exit face, and three totally reflecting surfaces disposed in the angle formed between said faces, each of said second mentioned totally reflecting surfaces being located in the path of one of said component beams for deflecting its component beam outwardly through the exit face in a direction parallel to the entrance face in the required manner, said second mentioned three totally reflecting surfaces being disposed inwardly of said exit face and one of said totally reflecting surfaces being disposed farther inwardly with respect to said exit face than said other two reflecting surfaces to equalize the length of the component beams through the glass of the combination.



2,101,729
HYDRAULIC PUMP OR MOTOR
Elek K. Benedek, Mount Gilead, Ohio
Application May 22, 1934, Serial No. 726,961
7 Claims. (Cl. 103—161)

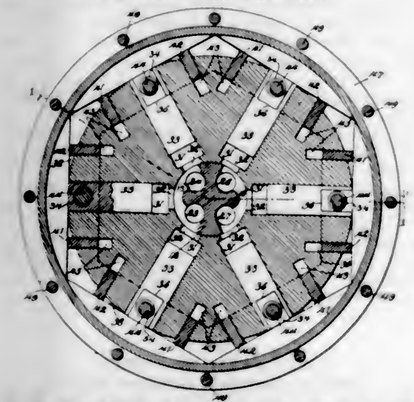
1. In a pump or motor of the character described, a casing, a rotor and supporting bearings therefor in the casing, a valve pintle in the casing disposed coaxially with said rotor and casing, relatively eccentric mechanism slidably mounted in said casing and including a ring and sliding support therefor in the casing, anti-friction bearings in said ring axially separated to provide a clearance space between said bearings, the rotor having radial guide ways and piston heads in said ways between said bearings in said clearance space, each head carrying a cross pin extending axially of the rotor, a piston associated with each piston head, a cylinder for each piston carried by said rotor and adapted to communicate with the valve, a mounting ring for each bearing inside thereof recessed to provide respective circular grooves one between each bearing and mounting ring to receive the piston actuating pins, coupling members disposed circumferentially between adjacent pistons to positively couple said mounting rings and maintain said bearings against axial displacement, and means carried by the rotor and positioned to engage the spacing means to effect a driving connection between said rotor and said relatively eccentric mechanism.

2,101,730
HIGH PRESSURE HYDRAULIC PUMP OR MOTOR
Elek K. Benedek, Bucyrus, Ohio
Application June 20, 1935, Serial No. 27,558
11 Claims. (Cl. 103—161)



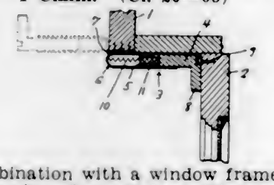
1. In a rotary radial plunger pump or motor including a casing, a rotatable barrel therein, plunger and cylinder assemblies carried by the barrel, axially floating reactance means for the assemblies, said barrel having a dead end valve bore, a stationary valve pintle fitting said bore for valving cooperation with the assemblies and terminating in spaced relation to the dead end of the bore, said pintle having high and low pressure valve ports and having a duct communicating with the pressure port and discharging into said dead end of the barrel bore, and said pintle being hydrostatically balanced by operating fluid at line pressure maintained between the end of the pintle and dead end of said barrel bore, whereby the pintle and barrel are urged axially apart by fluid at operating pressure, radial thrust anti-friction bearing means rotatably supporting the barrel in the casing and constraining the barrel to fixed radial position only, and anti-friction axial thrust bearings mounted in the casing in cooperation with the barrel for constraining the barrel to fixed axial position against the fluid pressure exerted thereon, said axial thrust bearings comprising an inner radially extending race in fixed position on the barrel, an outer radially extending race arranged to abut the casing under outward axial thrust forces and free to float radially relative to the casing, and free rolling elements interposed between the race for transmitting axially directed forces therebetween, and means operatively connecting the elements to the races for supporting the outer race in proper alignment with the inner race.

2,101,731
HYDRAULIC MACHINE
Elek K. Benedek, Bucyrus, Ohio
Application August 31, 1936, Serial No. 98,807
18 Claims. (Cl. 103—161)



1. In a hydraulic machine of the class described; a rotatable group of radial cylinders and cooperating pistons; a rotatable reactance assembly surrounding said piston group; and means for

transmitting driving force between the pistons and the reactance assembly, said means comprising a plurality of cross head elements, one connected to each piston, a plurality of separate self-aligning block elements fixed in said reactance assembly, there being at least one block element associated with each cross head element, each cross head element and its associated block element constituting a driving pair and one of the elements of each pair being formed with a way

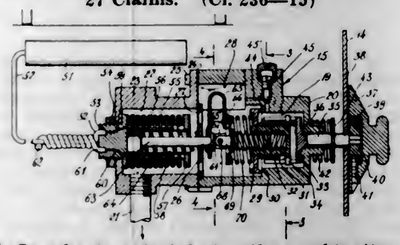


extending substantially normal to the associated piston axis and in a plane normal to the axis of rotation of the piston group, said ways each having inner and outer working surfaces, and rolling load-transmitting means operatively engaging both elements of each pair and extending through each cross head element on opposite sides of the associated piston axis and being adapted to have rolling engagement with the inner and outer working surfaces of the associated way.

2,101,732
HYDRAULIC MACHINE
Elek K. Benedek, Bucyrus, Ohio
Original application July 24, 1933, Serial No. 681,991. Divided and this application December 3, 1936, Serial No. 114,072
7 Claims. (Cl. 103—161)

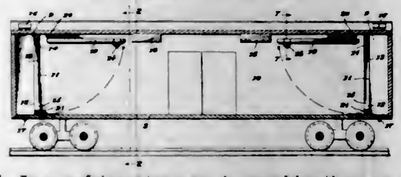
1. In a radial piston pump or motor, a rotor, piston and cylinder assemblies carried thereby, means to actuate the assemblies upon rotation of the rotor, said rotor having an axial bore, a valve pintle received in said bore and having ports for cooperation with the assemblies, and elongated cageless capillary needle rollers interposed between the barrel and pintle, and said rollers being freely rotatable with respect to each other and anti-frictionally constraining the pintle and barrel to coaxial relation.

2,101,733
WINDOW STRIP
Joseph Brunnhuber and Joseph Schmid, Altoona, Pa.
Application April 1, 1937, Serial No. 134,365
1 Claim. (Cl. 20—68)



The combination with a window frame having a sash therein, of a window strip comprising strip-like male and female members, respectively, the latter hingedly attached to the front corner of the frame to normally lie flat against the latter and to swing outwardly thereof and correspondingly swing the male member, said male member telescoping edgewise in the female member for movement into and out of the same and being tensioned against movement in the former direction whereby in the normal position of said female member said male member yieldingly bears at one edge against the sash, said edge of the male member being longitudinally grooved and the sash having vertically spaced studs extending therefrom and fitting into said groove, whereby the strip is interlocked with the sash against lateral swinging movement and adapted to be freed for such movement by telescoping of the male member inwardly of the female member.

2,101,734
NET CAP FOR PERSONAL WEAR
Jean Stuart Chapple, Hove, England, assignor of one-half to Beatrice Violet Chotzner, Hove, England
Application August 6, 1936, Serial No. 94,684
In Great Britain August 12, 1935
2 Claims. (Cl. 2—68)

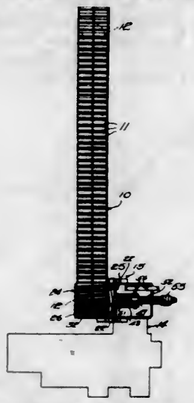


1. An inner cap for use in conjunction with a bathing cap to prevent the ingress of water between the bathing cap and the head and to hold the hair in place when the bathing cap is removed, comprising a net cap formed to fit the head of the wearer, a tubular binding of fabric extending entirely around the edge of the cap, elastic means disposed within the tubular binding and adapted to draw the edge of the cap against the head, the tubular binding having sufficient fullness to permit the elastic means to expand and contract, and a pad of absorbent material extending over the inner and outer faces of the rear portion of the net cap and extending around on each side thereof whereby to provide an absorbent element at the nape of the neck between the head of the wearer and the margin of the bathing cap at the rear thereof.

2,101,735
SELF-COMPENSATING HEAT REGULATOR
Edward L. Fonseca, Newark, N. J., assignor to The Wilcolator Company, Newark, N. J., a corporation of Delaware
Application November 17, 1931, Serial No. 575,525
27 Claims. (Cl. 236—15)

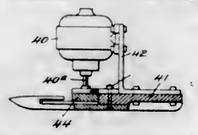
1. In a heat control device, the combination of a container, a tube connected thereto, and a filling tube connected at one end to the container and coiled around the first tube adjacent its connection with the container to serve as a guard therefor.

2,101,736
REFRIGERATOR CAR
Glenn C. George, Omaha, Nebr.
Application June 29, 1936, Serial No. 88,042
3 Claims. (Cl. 62—15)



1. In a refrigerator car, in combination, an ice bunker located in an end portion of the car, an evaporative refrigerating device spaced from the ice bunker, and a movable barrier member located between the ice bunker and the evaporative refrigerating device for completely closing off communication between the portion of the car containing the evaporative refrigerating device and the end portion of the car containing the ice bunker.

2,101,737
HAIR TRIMMER
Leonard A. Gesler, Aurora, Ill.
Application June 14, 1937, Serial No. 148,055
10 Claims. (Cl. 30—31)

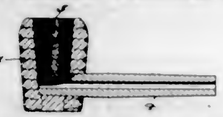


2. In a hair trimmer for trimming the hair on a human head, a cutting blade, a holder for said blade, a traction roller in advance of the cutting edge of said blade and adapted to be rotated by rolling contact with the head, and a pick-up roller between said traction roller and said cutting edge.

2,101,738
COIL HANDLING APPARATUS
Henry R. Gotthardt, Louisville, Ky., assignor to Logan Co. Inc., Louisville, Ky., a corporation of Kentucky
Application October 1, 1936, Serial No. 103,587
20 Claims. (Cl. 214—130)

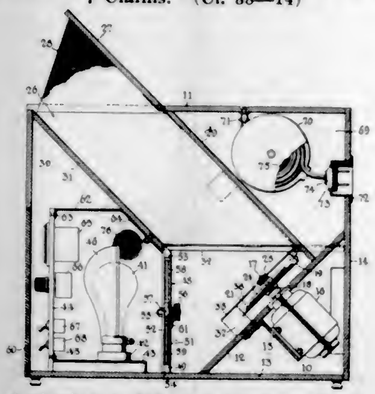
1. Apparatus of the character described comprising a support for an article, means for swinging said support to turn the article to a different position, said support having a relatively movable portion receiving the article when said support swings to a predetermined extent, and means for actuating said relatively movable portion when the article is supported thereon to discharge the article therefrom.

2,101,739
LAWN MOWER
Andrew L. Haugen, New York, N. Y.
Application June 21, 1937, Serial No. 149,490
2 Claims. (Cl. 56—25)



1. In a lawn mower, a frame having a transverse extending frame member, means secured thereto and adapted to support said frame above the ground, a guard bar secured to said member, a sickle bar mounted on said guard bar and coacting therewith, a motor mounted on said member and equipped with an eccentric, and a ring secured on said sickle bar in which said eccentric is adapted to revolve to actuate said sickle bar.

2,101,740
CORNCOB SMOKING PIPE
Harry Hirschl, Washington, Mo.
Application November 18, 1933, Serial No. 698,699
1 Claim. (Cl. 131—12)

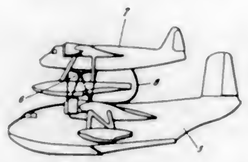


A smoking pipe of the character described having a corn cob bowl formed in its natural

condition provided with a charred or burnished, polished and varnished ornamental exterior sur-

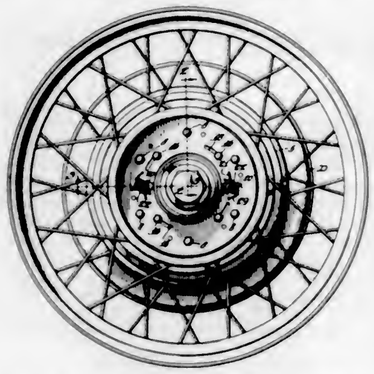
face, and a completely charred or burnished and smoothed inner surface having thereon a coating of an aromatic liquid.

2,101,741
COLOR ANALYZING APPARATUS
Howard Ketcham, New York, N. Y.
Application July 3, 1936, Serial No. 88,882
7 Claims. (Cl. 88—14)



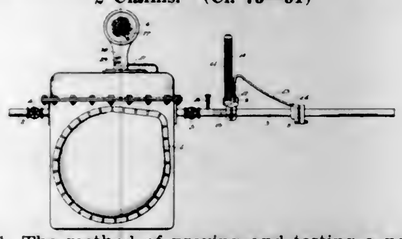
1. A viewing device comprising a cabinet having a plurality of partitions therein disposed to form a motor chamber, a lamp chamber and a sight tube; a motor in said motor chamber and having a shaft projecting into said sight tube; a graduated disc mounted on said shaft; a lamp in the lamp chamber for directing light along a line disposed at an angle of substantially 45 degrees with respect to the plane of said disc, and at approximately the same angle with respect to the axis of said sight tube; and means in the electric circuits of the lamp and motor for regulating the same.

2,101,742
CLOTHESPIN
Euclide Lognion, Lake Charles, La.
Application May 19, 1937, Serial No. 143,581
2 Claims. (Cl. 24—261)



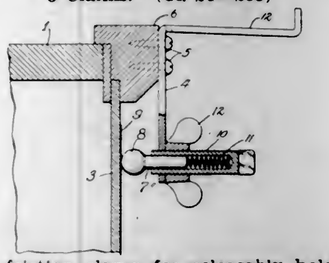
1. In a clothes pin, a pair of oppositely disposed U-shaped grippers, one having means for normally abutting the other intermediate the ends of the latter, said grippers having their forward end terminal portions extending away from each other to provide an entrance passage for a garment to be gripped to a clothes line, a pair of controlling springs, the sides of one of said grippers merging at their rear ends into the said springs, and a looped handle merging into said springs and in the rear ends of the sides of the other of said grippers.

2,101,743
AIRCRAFT
Robert Hobart Mayo, London, England
Application February 16, 1937, Serial No. 126,047
In Great Britain March 24, 1936
3 Claims. (Cl. 244—2)



1. A composite aircraft comprising in combination a lower component carrying a relatively heavy load of fuel, an upper component mounted on top of the lower component and carrying a relatively light load of fuel, locking means which secure the two components together but are releasable to enable the upper component to separate from the lower component during flight, and a fuel-transferring connection between the two components which continues to interconnect them after release of the locking means, and enables fuel to be transferred from the lower to the upper component after the two components have separated.

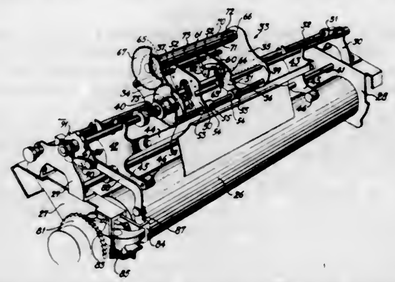
2,101,744
VEHICLE WHEEL
Louis B. McGuigan, Bryn Mawr, Pa.
Application October 24, 1935, Serial No. 46,613
5 Claims. (Cl. 301—9)



1. In a wheel assembly of the character described having an inner fixed hub structure and an outer hub shell mounted on the inner hub structure, an annular plate on the side of the outer shell opposite to the inner hub structure and movable to secure the shell in place on the inner hub structure, threaded studs projecting from said inner hub structure and through said hub shell, and said plate having openings through which said studs extend, nuts threadedly engaging said studs and engaging the plate to move the latter into position for securing the shell in place, each nut being provided on its circumference with ratchet teeth, and a dog pivotally mounted on the plate and engageable with the ratchet teeth to secure the nut against retrograde movement.

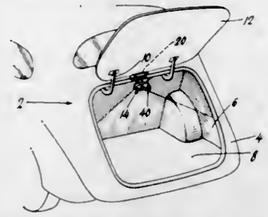
2,101,745
METHOD AND APPARATUS FOR CALIBRATING AND PROVING METERS
Allen D. MacLean, Pittsburgh, Pa., assignor to Pittsburgh Equitable Meter Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 13, 1935, Serial No. 54,316
2 Claims. (Cl. 73—51)

1. The method of proving and testing a positive meter having a pressure correcting device including corrected and uncorrected volume counters driven thereby, which comprises, passing gas through said positive meter at an operating pressure above the base pressure, reducing the pressure of the gas discharged from the positive meter to the base pressure, determining the volume of gas at the base pressure and comparing the determined volume of gas with the corrected volume counter.



2,101,746
FRICTION CLAMP
Mario Manfredi, New York, N. Y.
Application February 10, 1936, Serial No. 63,189
3 Claims. (Cl. 24—263)

1. A friction clamp for releasably holding a sheet of material against a supporting surface, comprising a rigid bracket, a hollow adjustment member having threaded engagement with one end of the bracket, a ball-headed plunger slidably mounted within said member and engageable with the sheet, and a spring housed within said member and urging said plunger outwardly therefrom, and a lock-nut for securing said member in adjusted relation to the bracket.



2,101,747
TALLY ROLL MECHANISM
Miles H. Mann, Hartford, Conn., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application December 31, 1936, Serial No. 118,509
10 Claims. (Cl. 197—132)

1. A tally roll mechanism for application to a roller-platen frame of a typewriter having a line spacing mechanism, comprising an auxiliary frame having end plates and tie rods spacing said end plates for a maximum width of tally strip, a wind-up roll extending from one end plate to the other, gearing for driving the wind-up roll from the line spacing mechanism including a clutch for enabling and disabling the drive, and a pair of members mounted on said tie rods and

relatively adjustable within the auxiliary frame to different fixed positions to accommodate different widths of tally strip, said members having means for confining a tally supply roll in desired position lengthwise.

2,101,748
LUGGAGE COMPARTMENT LAMP
Clarence A. Michel and Robert Winkelmeyer, Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 27, 1935, Serial No. 23,656
7 Claims. (Cl. 240—7.1)

1. An attachment for closed compartments with a hinged door for access thereto comprising a casing, a source of light supported therein, switching means for controlling the light also supported within the casing, spring biased operating means extending from the casing and multiple position clamping means attached to the casing for connecting the same to the compartment adjacent the door whereby the operating means will be operated by the door movement.

2,101,749
MANUFACTURE OF MONOMETHYL-PARA-AMINOPHENOL AND ITS SULPHATE
Simon Norman, Providence, R. I., assignor to Industrial Dyestuff Company, East Providence, R. I., a corporation of Rhode Island
No Drawing. Application July 30, 1935, Serial No. 33,915
12 Claims. (Cl. 260—128)

1. A process of manufacturing monomethyl-para-aminophenol, which process comprises decomposing para-hydroxy-phenylglycine to monomethyl-para-aminophenol in a reaction medium containing essentially a straight chain aliphatic ketone having a boiling point above 145° C.

4. A process of manufacturing monomethyl-para-aminophenol, which process comprises de-

composing para-hydroxy-phenylglycine to monomethyl-para-aminophenol in a reaction medium containing essentially methyl-n-hexylketone.

2,101,750

MANUFACTURE OF MONOMETHYL-PARA-AMINOPHENOL AND ITS SULPHATE

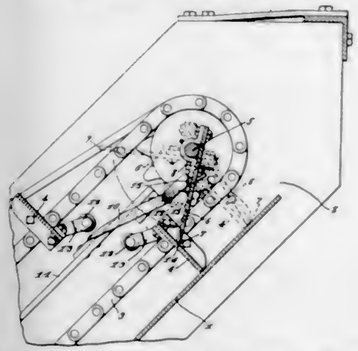
Simon Norman, Providence, R. I., assignor to Industrial Dyestuff Company, East Providence, R. I., a corporation of Rhode Island

No Drawing. Original application July 30, 1935, Serial No. 33,915. Divided and this application April 27, 1936, Serial No. 76,696

16 Claims. (Cl. 260—128)

1. A process of manufacturing monomethyl-para-aminophenol, which process comprises decomposing parahydroxy-phenylglycine to monomethyl-para-aminophenol in reaction media containing essentially a mixture of straight chain aliphatic ketones having a resultant boiling point of at least 145° C.

8. A process of manufacturing monomethyl-para-aminophenol, which comprises decomposing para-hydroxy-phenylglycine to monomethyl-para-aminophenol in media containing essentially methyl-propylketone and methyl-n-nonylketone.



2,101,751

CLEANER FOR CONVEYERS

Myrl N. Penny, Lawrence, Kans.

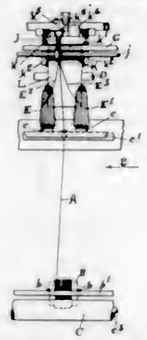
Application March 14, 1936, Serial No. 68,961

3 Claims. (Cl. 198—229)

1. In combination with a conveyer having an endless conveying means including flights, a supporting shaft for said conveying means located adjacent the discharge end of the conveyer, a blade journaled to said shaft and movable about the latter when engaged by a flight, and means temporarily retaining the blade in a position to contact the flight as the latter nears the discharge end and moved over said flight with frictional contact therewith to remove foreign matter adhering to the flight.

2,101,752

MANUFACTURE OF ELASTIC THREADS



Robert Pickles, Burnley, and John Pickles, Fence, near Burnley, England

Application May 12, 1936, Serial No. 79,370

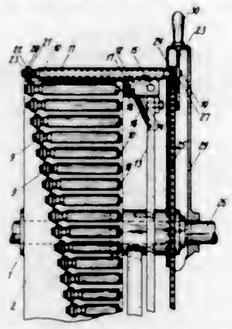
In Great Britain September 14, 1935

4 Claims. (Cl. 117—21)

1. A process for manufacturing elastic thread comprising combining one or more non-extensible fibrous threads with a rubber filament and at the same time ballooning the fibrous threads,

and subsequently twisting the combined threads into a completed strand.

2,101,753



METHOD OF PRODUCING PERFORATIONS OF SMALL DIAMETER IN BANDS OF CELLULOSE FOIL, METAL FOIL, AND THE LIKE

Adolf Rambold, Dresden, Germany

Application August 8, 1935, Serial No. 35,390

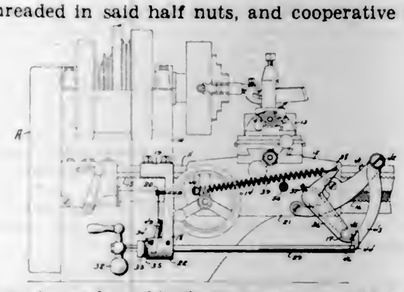
In Germany September 17, 1934

4 Claims. (Cl. 164—125)

1. That method of producing rows of perforations of small diameter in bands of thin cellulose, metal foil and the like which consists in perforating the band along the several rows at stepped points in the length, each row during its formation terminating in advance of the next succeeding row, each of said perforations being formed by cutting the material in such manner that the forward edge of each perforation is first cut and the cutting proceeds from front to rear of the perforation with respect to the front and rear of the band.

2,101,754

CARRIAGE RELEASE FOR LATHES



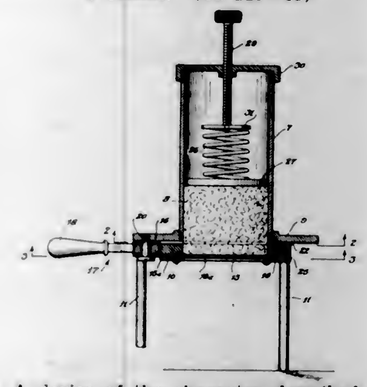
Laurence Harrington Randall, Lakeland, Fla., assignor of one-half to Anna M. Randall, Daytona Beach, Fla.

Application April 3, 1937, Serial No. 134,763

9 Claims. (Cl. 82—21)

1. In a release or stop of the kind described, a hanger bracket having a cylindrical head, half nuts releasably fitted in said head, a micrometer rod engaged in said head, a micrometer sleeve slidably splined on the rod and swiveled in said half nuts, a screw on the rod and

threaded in said half nuts, and cooperative micrometer scale and indicator means on said sleeve and head, respectively.



2,101,755

SLICING MACHINE

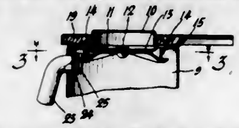
Samuel D. Rosenstone, Passaic, and Charles Ackerman, Hackensack, N. J.

Application October 11, 1935, Serial No. 44,624

2 Claims. (Cl. 146—63)

1. A device of the character described, comprising a container adapted to receive material to be cut and having a discharge opening, means for urging the material toward said opening, an annular plate threadedly secured to the discharge end of said container, a second annular plate secured to and spaced from said first mentioned plate, a substantially circular plate adjacent said last mentioned annular plate for opening and closing the discharge opening of the container, a cutting blade positioned above and offset at an angle to said circular plate and horizontally disposed between said first annular plate and said second annular plate and adapted to be swung under the contents of the container to support same when the plate moves away, means for pivotally mounting said blade and plate on a common pivotal point and means for simultaneously swinging said blade and plate.

2,101,756



RADIATOR CAP

Laurence P. Saunders and Philip S. Rosenberg, Lockport, N. Y., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

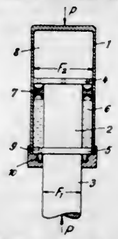
Application February 24, 1936, Serial No. 65,207

5 Claims. (Cl. 220—44)

1. In an engine cooling system, a filler spout an overflow pipe leading therefrom, a spring plate carried by the spout and adapted for deflection to close the overflow pipe, a spout closure cap having a locking bar, and a camming abutment for engagement with the bar upon rotation of said closure and having spaced stations between which

the bar is movable in locked relation with the spout, one of the stations being positioned in relation to said spring plate that one end of the bar engages and deflects the plate to close the overflow pipe.

2,101,757



SHOCK ABSORBER

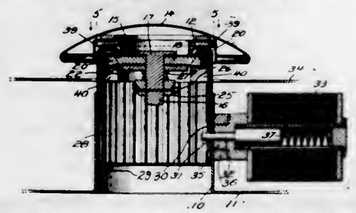
Heinrich Schumacher, Berlin, Germany, assignor to Fein-Maschinenbaugesellschaft m. b. H., Berlin, Germany

Application October 10, 1935, Serial No. 44,409

In Germany October 16, 1934

4 Claims. (Cl. 267—64)

1. Shock absorber comprising an air chamber, a piston within said air chamber, a flange upon the leading end of said piston, ports in said flange, a second piston surrounding the first and fitting closely between said first piston and the inner wall of said air chamber outwardly of said flange, a liquid chamber on the outer side of the second said piston, a second flange upon the first said piston projecting into said liquid chamber and ports through said second flange, affording communication for the liquid in said liquid chamber between the two sides of the second said flange.

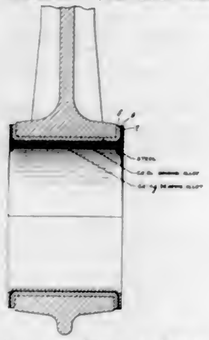


2,101,758

ELECTROMAGNETIC GAS TANK LOCK

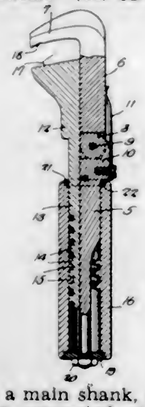
Phillip Shaffer, Mitchell, Nebr.

Application November 9, 1936, Serial No. 110,015



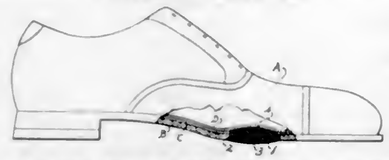
3 Claims. (Cl. 292—144)

1. A gas tank lock for a tank having a flanged filling tube and a cap having a portion insertable in the tube, said lock comprising a retaining disc having a slip clutch connection with the cap permitting the cap to swivel when the locking tube is in locked position, a spring pressed plunger on the filling tube adapted to engage the lock-



ing tube to lock the tube stationary, withdrawal of the plunger permitting the locking tube to be rotated to released position, and locking lugs projecting from one of the slip clutch members and engageable underneath the flange of the filling tube for locking the cap to the tube, said lugs being slidably connected to the locking tube and being rotatable with the locking tube when connected therewith.

2,101,759
BEARING
Clarence F. Smart, Pontiac, Mich., assignor to General Motors Corporation, Pontiac, Mich., a corporation of Delaware
Application July 2, 1934, Serial No. 733,385
10 Claims. (Cl. 308—242)

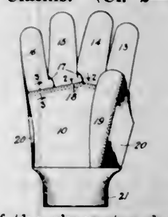


1. A bearing comprising a base of relatively hard and strong metal and a facing integrally bonded thereto, said facing comprising an alloy of cadmium with relatively small additions of silver and a hardening metal.

2,101,760
WRENCH
Harvey H. Smith, Columbus, Ohio
Application September 20, 1935, Serial No. 41,482
1 Claim. (Cl. 81—106)

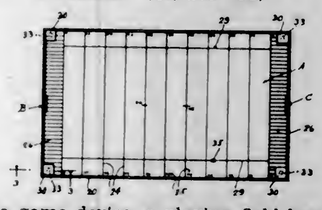
In a wrench, a main shank, a jaw including a shank, pivotally connected at one end of the main shank, said main shank having a reduced end formed with threads, a shank having threads along the outer edge thereof, cooperating with the first mentioned shank and having a jaw at its outer end, a tubular handle positioned over the shanks, said handle having internal threads cooperating with the threads of the latter shank, a washer fitted against one end of the tubular handle closing the tubular handle, said washer having an opening through which the threaded portion of the first mentioned shank extends, a nut secured on the threaded portion of the first mentioned shank and engaging the washer securing the handle against movement longitudinally of the shank in one direction, means for restricting movement of the handle section longitudinally of the shank in the opposite direction, and said handle adapted to move the latter jaw with respect to the first mentioned jaw when the handle is rotated.

2,101,761
METATARSAL RUBBER CUSHION REST
Joseph E. Stagl, Brooklyn, N. Y., assignor to Charles Stagl
Application February 19, 1936, Serial No. 64,709
1 Claim. (Cl. 36—71)



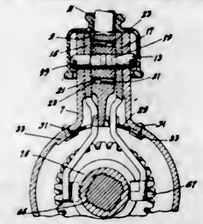
In a shoe having a recess extending from the insole and through the underside of the outer sole thereof, a metatarsal supporting pad formed from yieldable material to provide a body secured within the recess for disposal at the base of the metatarsal bones, with its outer side exposed to provide a ground engaging or tread surface, said body having a convexed upper surface to raise the insole and a convexed tread surface, and a flange surrounding the body at the tread surface thereof and being secured to the outer sole.

2,101,762
AIR GUN
Alvin L. Straub, Tomball, Tex.
Application May 20, 1936, Serial No. 80,848
3 Claims. (Cl. 124—11)



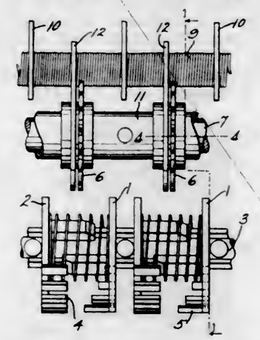
1. In an air gun, a stock and a barrel, the said stock having a magazine and the barrel having a projectile chamber communicating therewith, means for urging projectiles from the magazine to the chamber, the said barrel having a slot merging with the portion thereof in which the projectile is lodged prior to its discharge, a detent slidable through the slot into engagement with the projectile in the chamber and operative to hold the projectile therein, the said barrel having a slot in proximity to the first mentioned slot, a lever oscillatably mounted in the last mentioned slot and having an angularly disposed portion lying longitudinally of the barrel when engaged by the projectile, means for oscillating the lever to move the angularly disposed portion into the barrel when the projectile is discharged, the said angularly disposed portion being in position to be engaged and moved by the succeeding projectile, means for urging the detent into operative relation with the projectile, means for retracting the detent when the projectile is to be released, an air pressure reservoir carried by the gun structure, means of communication between the said reservoir and the chamber back of the position of the projectile in the chamber whereby air issuing from the reservoir discharges the projectile when it is released, and means for holding the projectiles in the magazine during the firing of the projectile in the chamber, the said means being releasable upon completion of the firing.

2,101,763
GLOVE
Frank X. Sturm, Sr., Jasper, Ind.
Application June 6, 1936, Serial No. 83,984
5 Claims. (Cl. 2—169)



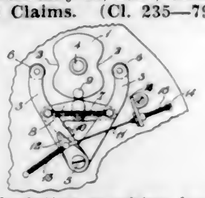
1. A glove of the character described having a front face of a leather palm portion and separate leather fronts for the first, second, third and fourth fingers, said finger fronts having overlapping portions and being stitched to each other providing a flat overlapping seam, and said finger portions being collectively secured to the upper part of the palm portion by a flat overlapping seam.

2,101,764
GAME
Harry A. Swart, San Marino, Calif.
Application January 14, 1936, Serial No. 59,139
8 Claims. (Cl. 273—94)



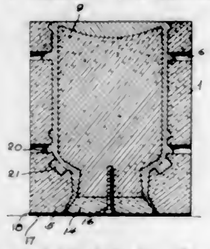
1. In a game device, a playing field having at least one objective goal, an individual playing piece movably supported on and in contact with the field, and movable in a direction toward the goal at the will of a human player; the combination with the aforesaid elements of a self-supporting barrier unit solely supported within the playing field and there to remain stationary in the path of the advancing movable playing piece, said barrier unit including a plurality of upright bodies, and a rod spaced above the playing field carrying the intermediate bodies and anchored to the end bodies of the unit, the intermediate bodies of the unit being shiftable on the rod to regulate spaces between the bodies to frustrate and sometimes decoy offensive maneuvers of the playing piece, additional bodies of offense supported in stationary position on the playing field, said additional bodies formed with a base having parts diverging from the body to form pockets, and a rollable body independent of the aforesaid playing pieces adapted to be engaged in said pockets.

2,101,765
AUTOMOTIVE TRANSMISSION
Perry L. Tenney, Lansing, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 22, 1934, Serial No. 707,663
4 Claims. (Cl. 74—477)



1. In combination, a transmission housing, movable power-transmitting ratio changing members in said housing, a pivot pin extended transversely of and within said housing, shift elements rotatably supported on said pin and engaging said members, a manually operable lever mounted on said pin for both longitudinal and transverse rocking movements, said lever having parts to engage the one or the other of said elements by its transverse movements and to thereafter rock said engaged element by its longitudinal rocking movement.

2,101,766
CALCULATING MACHINE
Edward C. Walter, Orange, N. J., assignor to Monroe Calculating Machine Company, Orange, N. J., a corporation of Delaware
Application December 17, 1935, Serial No. 54,909
2 Claims. (Cl. 235—79)

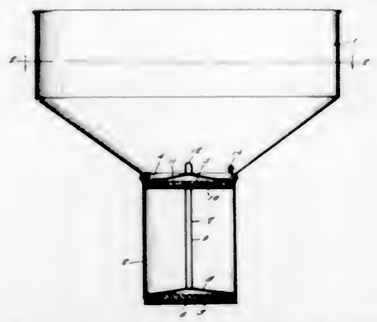


1. In a machine of the character described, provided with numeral wheel gears, means for actuating said gears differentially in accomplishing digitation including differential gears and gearing connections between said differential gears and said numeral wheel gears, means for adjusting said differential gears to bring selective teeth thereof into active registering position, and means for checking over-rotation of said numeral wheel gears including a coiled spring parallel to and engaging said gearing connections and having spaced supports; means lying within the paths of movement of the adjusted and without the paths of movement of unadjusted differential gears and cooperating with the active teeth of said differential gears acting as cams for rendering said check spring ineffective during said differential movement of the numeral wheel gears.

2,101,767
CALCULATING MACHINE
Edward C. Walter, Orange, N. J., assignor to Monroe Calculating Machine Company, Orange, N. J., a corporation of Delaware
Application February 19, 1937, Serial No. 126,699
2 Claims. (Cl. 235—79)

1. In a calculating machine having numeral wheels, actuating mechanism therefor, and stopping means operable after the actuating mechanism has passed through full cycle position to retard said mechanism and to return the same to full cycle position; means for locating the actuating mechanism at rest in full cycle position including a cam having operating connection with said actuating mechanism and provided with opposite low points, spring tensioned members engaging said low points of the cam, said cam acting on initial movement of said actuating mechanism to move said members outwardly against the tension of their spring, means including a toggle joint for holding said members so moved outwardly, and means having operating connection with said stopping means and operable after the actuating mechanism has passed through full cycle position to release said holding means.

2,101,768
METHOD AND APPARATUS FOR MOLDING SEAMLESS HOLLOWWARE ARTICLES
Calvin C. Warren, South Dayton, N. Y., assignor of one-third to Edward Amacher and one-third to George W. Percy, both of South Dayton, N. Y.
Application June 15, 1937, Serial No. 148,370
5 Claims. (Cl. 22—190)

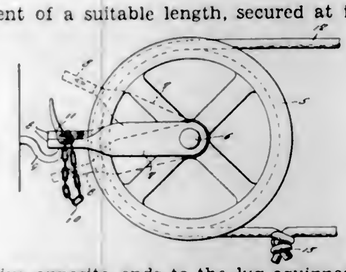


1. Molding apparatus for forming seamless milk cans of the type having restricted openings which comprises an outer female member whose inner wall is substantially cylindrical and terminates in a frustro-conical portion converging inwardly, an inner core member whose outer surface comprises a cylindrical portion the lower part of which forms a frustro-conical surface converging inwardly, said core member being of such diameter as to provide a space between the core member and the female member, a spacing member fitting within the lower portion of the female member, means for detachably securing the spacing member to the core member, a cover plate secured to the outer surface of the spacing member and covering the lower surface of the female member, the upper surface of the core member terminating in a plane slightly below the upper surface of the female member.

2,101,769
SWEEPER ATTACHMENT FOR MOTOR VEHICLES
Andrew Jackson Westmoreland, Florence, Ala.
Application April 30, 1936, Serial No. 77,263
3 Claims. (Cl. 15—78)

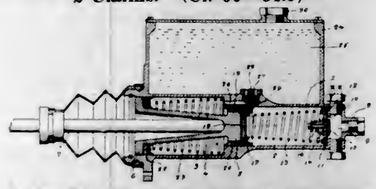
1. An attachment of the kind described comprising front and rear pivotally connected frame sections for the swinging of the front section over the rear section, casters swiveled to said sections for movably supporting the same, means for separably attaching the rear section to a vehicle, a sweeper mounted for vertical adjustment on the front section and adapted for the sweeping of a ground surface when said front section is lowered from over the rear section, and curb sweeping brushes carried by the said front section and disposed beyond opposite ends of the first-mentioned sweeper.

2,101,770
MILK STRAINER
Wilbur Wolfe, Carmel, Ind.
Application February 16, 1937, Serial No. 126,041
4 Claims. (Cl. 210—158)



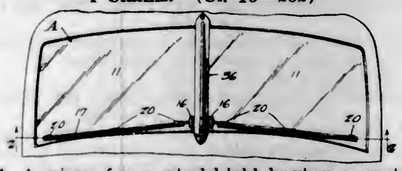
1. A strainer comprising a funnel including a depending discharge neck, a perforated bottom in the lower portion of said discharge neck, a removable pad mounted on said bottom, a perforated member resting on the pad, a stem rising from said perforated member, a second perforated member supported on the upper end of the stem, and a second pad resting on the second perforated member.

2,101,771
PULLEY
Elizabeth Yarnell, Elizabeth, N. J.
Application January 7, 1937, Serial No. 119,535
1 Claim. (Cl. 254—194)



A pulley assembly comprising a pulley wheel, an axle on which said wheel is mounted, a pair of hanger arms provided at one end with apertures receiving therein the respective opposite ends of said axle, said hanger arms at their free ends being provided with integral apertured lugs adapted to be arranged in alignment to engage a suspension hook or the like, and a flexible

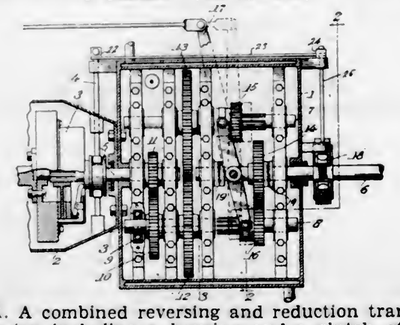
element of a suitable length, secured at its re-



spective opposite ends to the lug equipped ends of said arms.

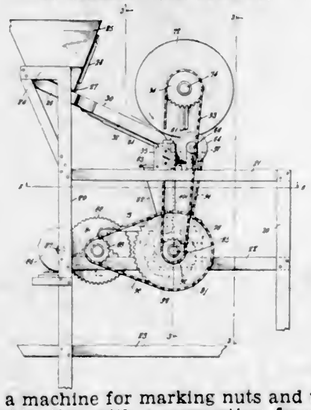
2,101,772
COMPOUND MASTER CYLINDER
Roscoe N. Baughn, Conway, Ark.
Application April 18, 1936, Serial No. 75,193
2 Claims. (Cl. 60—54.6)

1. A brake operating means for hydraulic braking systems comprising a master cylinder including bores of different diameters forming primary and secondary cylinders, a master piston operating in the master cylinder and including integrally connected heads of a size to match the bores of the primary and secondary cylinders, means for connecting the primary cylinder of the master cylinder to a hydraulic braking system, a double acting check valve for said last means and including a spring, one of the heads of the master piston having ports to place the primary and secondary cylinders in communication, a check valve plate controlling said ports and slidably supported by said last-named head, a cup-type piston operating in the primary cylinder and held against the plate valve by said spring, an operating means connected to the master piston, a reservoir carried by the master cylinder, said master cylinder having a passage communicating the primary and secondary cylinders with the reservoir, and a check valve operating in said passage for preventing flow towards the reservoir and having a restricted passage therethrough maintaining communication between the secondary cylinder and the reservoir at all times.



2,101,773
WINDSHIELD WIPER
Thomas Benton Bowen, Huntington, W. Va.
Application February 1, 1937, Serial No. 123,464
4 Claims. (Cl. 15—252)

1. A wiper for a windshield having a central upwardly directed post and glass panels at opposite sides thereof, comprising a movable carriage

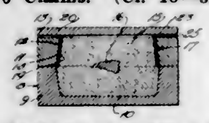


built into the post for up and down motion with respect to said panels, a shaft journaled within said post and having connection with the carriage for imparting up and down motion thereto, and reversely extended laterally directed wiper arms fitted with the carriage for contact with the windshield.

2,101,774
REVERSIBLE REDUCTION GEAR
Evan W. Brasfield, Sheffield, Ala.
Application August 15, 1936, Serial No. 96,259
3 Claims. (Cl. 74—358)

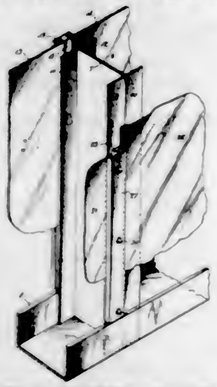
1. A combined reversing and reduction transmission including a housing and a clutch of a power source, a drive shaft supported by the housing and connected to the clutch, a driven shaft supported by the housing and arranged in endwise alignment with the drive shaft, counter shafts journaled in the housing, means connecting the countershafts, means connecting one of the countershafts to the drive shaft, a gear secured to the driven shaft, pinions slidably secured to the countershafts, and manually controlled means connected to said pinions for moving said pinions in opposite directions whereby the driven shaft may be rotated in either direction by the rotation of the drive shaft in one direction.

2,101,775
BRANDING MACHINE
William P. Bullard and Oswell L. Williams, Albany, Ga., assignors to National Pecan Growers Exchange, Albany, Ga., a corporation of Georgia
Application December 22, 1936, Serial No. 117,232
20 Claims. (Cl. 101—40)



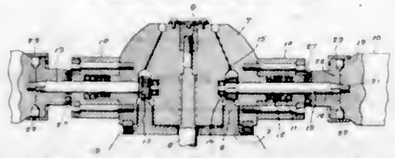
3. In a machine for marking nuts and the like, the combination with a supporting frame, of a

supply hopper, a marking device, a chute for conveying said nuts from the hopper to the marking device, said chute consisting of a stationary side portion and a combined bottom and side sliding portion cooperating with said stationary portion and means for reciprocating said sliding portion.



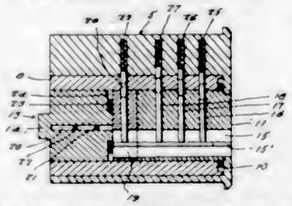
4. In a machine for marking nuts and the like, the combination with a supporting frame, of a supply hopper, a marking device, a chute for conveying said nuts from the hopper to the marking device, a spiral notched rotary cam, and means interposed between said cam and chute whereby said chute will be agitated upon the rotation of said cam.

2,101,776
MOLD-FLASK SEPARATOR
Arnold H. Feldman, Chicago, Ill.
Application February 25, 1937, Serial No. 127,753
6 Claims. (Cl. 18—33)



1. In a mold-flask separator, a bendable composite body formed of an outer section of cushioning material and an inner section of thin metallic material abutting the inner face of the outer section, said sections being of tape-like form, said inner section including a portion extending from one of the lengthwise edges of the outer section capable of being bent outwardly to overlap said edge, said portion being formed throughout with spaced parallel slits disposed in transverse relation with respect to the remaining portion of the said section.

2,101,777
BUILDING CONSTRUCTIONS
Charles J. Fox, Ellicottville, N. Y.
Application September 14, 1935, Serial No. 40,648
3 Claims. (Cl. 189—88)

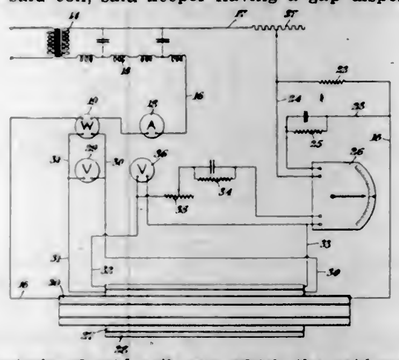


1. A building structure comprising a frame member formed of two channel elements connected back to back, and means for detachably fastening two panels to one flanged face of the member, said means comprising a key strip of channel formation having its back secured to a flange of only one of the two channel elements and having a transversely extending flange carried by each side wall thereof, a cover strip to overlie the key strip and having inwardly directed flanges terminating laterally outwardly of the key strip to clamp the panels against the frame member, and means engaging the side flanges of the key strip to hold the cover strip in place.

2,101,778
AIRCRAFT
Max Theodore Hempe, Providence, R. I.
Application March 30, 1936, Serial No. 71,735
3 Claims. (Cl. 170—162)

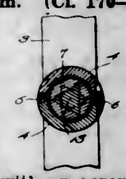
1. A helicopter propeller comprising a housing, a plate supporting the housing for revolution in a horizontal plane, boxes detachably secured to said housing, shafts journaled in said boxes and extending into the housing, a ring gear secured to the plate, pinions connecting the ring gear to the shafts, blades detachably secured to said shafts, and bearings interposed between the blades and the boxes and supported by the shafts.

2,101,779
CYLINDER LOCK
Frederick W. Kenney, Bloomfield, N. J.
Application February 24, 1936, Serial No. 65,504
14 Claims. (Cl. 70—419)



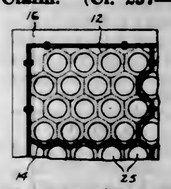
1. A cylinder lock of the character described comprising a relatively stationary casing formed with a bore, an outer tubular cylinder rotatable in said bore, a front cylinder, an intermediate cylinder, and a final cylinder rotatably mounted in the bore of said tubular outer cylinder, a locking bolt operating element on said final cylinder, first means engaging said final cylinder, said outer tubular cylinder, and said casing for holding said final cylinder and said outer tubular cylinder and said casing from rotating relative to each other in a locked condition of the lock, second means in said casing and said outer tubular cylinder preventing relative rotation of said outer cylinder and said casing in a locked condition of the lock.

2,101,780
ELECTROMAGNETIC TESTING OF MATERIALS
Carl Kinsley, Westfield, N. J., assignor to United States Steel Corporation, New York, N. Y., a corporation of New Jersey
Application October 8, 1932, Serial No. 636,921
18 Claims. (Cl. 175—183)



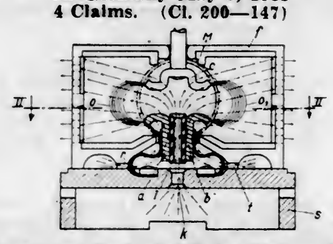
1. In apparatus for the magnetic testing of materials, means to obtain a substantially uniform magnetic flux throughout a known mass of said material, said means including an electromagnetic coil adapted to extend beyond the ends of the said mass to be tested, compensating windings

adjacent the ends of said coil to substantially equalize the magnetic flux in said mass, a keeper for said coil, said keeper having a gap disposed



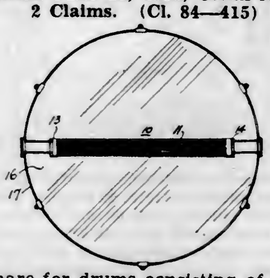
interiorly of said coil over which the said mass of material to be tested may be bridged, and means to pass a determined magnetizing current through the said coil.

2,101,781
FREEWHEELING DEVICE FOR AEROPLANE PROPELLERS
John H. Knobeck, Madison, Wis.
Application December 22, 1936, Serial No. 117,244
1 Claim. (Cl. 170—173)



In combination with an aeroplane engine having a power shaft provided with a bore of triangular shape in cross section, a propeller including a hub journaled on said shaft and provided with a triangular-shaped bore, a spring-pressed clutch element slidable in the bore of the shaft and adapted to enter the triangular-shaped bore of the hub for securing the propeller to the shaft, and a manual control connected to the clutch element.

2,101,782
HEAT EXCHANGE APPARATUS
Max H. Kuhner, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Application October 27, 1936, Serial No. 107,831
1 Claim. (Cl. 257—224)

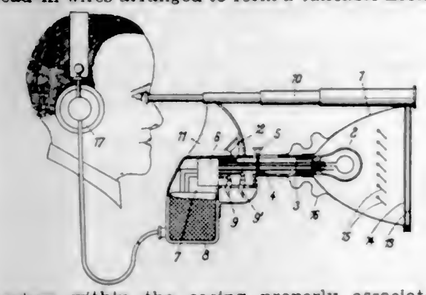


Heat exchange apparatus comprising a series of parallel metal tubes arranged in a plurality of groups and having their end portions enlarged into the shape of a polygon, the polygonal portions of adjacent tubes within each group being welded together, a metal strip extending around each group of tubes and welded to the polygonal portions thereof, and means to fasten together the strips of adjacent groups.

2,101,783
SPARK CHAMBER FOR AUTOMATIC CUT-OUTS
Wilhelm Leyhausen, Nuremberg, Germany
Application May 2, 1936, Serial No. 77,587
In Germany May 3, 1935
4 Claims. (Cl. 200—147)

1. In an overload circuit breaker, a base, a pair of spaced contacts spring supported from said base, a movable contact normally bridging said spaced contacts, a substantially closed chamber surrounding said contacts and resting on said base, means to admit air to said chamber between said pair of contacts, means at the ends of said chamber to discharge air from the chamber, and a pair of blow-out magnets supported on said base at opposite sides of the chamber and disposed in alinement with the space in the chamber centrally above the pair of contacts.

2,101,784
SNARE FOR DRUMS
George H. Logan, Pittsburgh, Pa.
Application June 18, 1936, Serial No. 85,934
2 Claims. (Cl. 84—415)



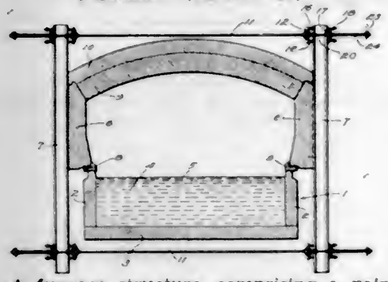
1. A snare for drums consisting of a plurality of spirally wound metallic strands of equal lengths arranged parallel in substantially one plane, and a pair of end plates to which all of the strands are secured at each end, half of the number of strands being wound in one direction, and the other strands being oppositely wound, thereby to counter-balance any tendency of the strands to twist either end plate out of its normal plane.

2,101,785
APPARATUS FOR SIGNALING WITH ULTRASHORT WAVES
Ernst Wilckens, Berlin-Sudende, Germany, assignor to Julius Pintsch Aktiengesellschaft, Berlin, Germany
Application May 13, 1936, Serial No. 79,459
In Germany January 8, 1935
7 Claims. (Cl. 250—6)

1. A portable compact transmitter of relatively light weight and capable of being readily

manipulated by a single user, comprising an elongated casing provided at its forward end with a concave mirror and at its rear end with a hand grip and a microphone, an ultra-short wave oscillator in the mirror, switch controlled lead-in wires arranged to form a tuneable Lecher

system within the casing properly associated with a source of current, the microphone and the oscillator, an upstanding hollow mouthpiece at the upper rear end portion of the casing, and a microphone disposed within the mouthpiece.



2,101,786

FURNACE CONSTRUCTION

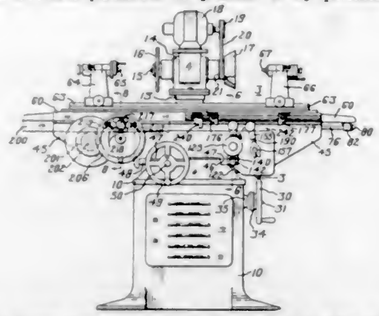
Charles H. Wise, Hartford, Conn., assignor to Hartford-Empire Company, Hartford, Conn., a corporation of Delaware

Application January 25, 1936, Serial No. 60,834

9 Claims. (Cl. 263—46)

1. A furnace structure, comprising a pair of opposing buckstays, a tie rod therebetween, means providing a resilient connection between said tie rod and at least one of said buckstays, and optionally usable means providing a rigid connection therebetween, all said means being so constructed and arranged as to afford undiminished support to said furnace structure during the transition from said resilient to said rigid connection and vice versa.

2,101,787



GRINDING MACHINE

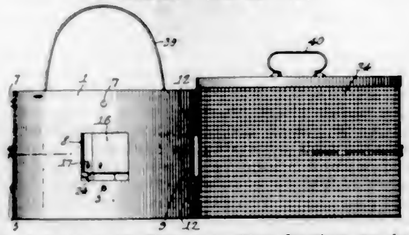
Charles H. Amidon, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application March 30, 1936, Serial No. 71,543

10 Claims. (Cl. 51—95)

1. A grinding machine comprising a rotatable grinding wheel, a rotatable work support, a longitudinally movable table for said support, means to move the grinding wheel and work support transversely relative to each other, manual means to traverse said table longitudinally, a fluid pressure system including a piston and cylinder operatively connected to reciprocate the table longitudinally, means including a reversing valve to change the direction of movement of the table, a control valve which serves in one position to control the speed of movement of the table and in a second position to permit a by-passing of

fluid from one end of the cylinder to the other, and means actuated by the movement of the control valve to render the manual traverse mechanism inoperative.



2,101,788

TRAP

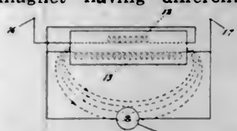
Lew Benson, San Francisco, Calif., assignor of one-half to Arthur C. Benson, Glendale, Calif.; one-sixteenth to Lesley Dallas Benson, Tillimook, Oreg.; one-sixteenth to John Benson, Phillipsburg, Kans.; one-sixteenth to Bert O. Benson, one-sixteenth to Charl. Benson, one-sixteenth to William Benson, all of Vennes, Calif.; and one-sixteenth to Karl Mudge, East St. Louis, Ill.

Application May 18, 1937, Serial No. 143,351

3 Claims. (Cl. 43—74)

1. A trap including a section having an inlet and an outlet, a gate mounted for rotation in said section and including radial sweeps and a wing at the outer end of each sweep, a trigger for engaging one of the sweeps to hold the gate against rotation in one direction and to maintain the wings at one side of the inlet and the outlet respectively, said trigger being depressible by a rodent entering between the sweeps at the inlet, and means for automatically actuating the gate when the sweep is released to simultaneously close the inlet with one of the wings and force the rodent to a position adjacent to the outlet, and gravity means carried by said section for holding the gate from movement against the action of its operating means.

2,101,789



CONTROL OF ELECTRIC ARC LAMPS

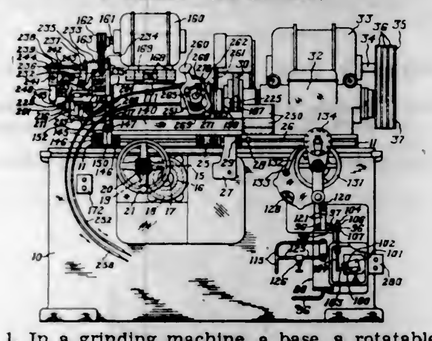
Laurence Burns, Revere, Mass., assignor to Hygrade Sylvania Corporation, Salem, Mass., a corporation of Massachusetts

Application September 11, 1935, Serial No. 40,048

6 Claims. (Cl. 176—124)

1. In combination, an electric arc lamp of the high pressure vapor type and an electromagnet to control the position of the discharge therein, said electromagnet having differentially con-

nected windings, the terminals of one of the windings being conductively and directly connected to the terminals of the lamp.



2,101,790

GRINDING MACHINE

Raymond A. Cole and Charles H. Amidon, Worcester, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application October 14, 1936, Serial No. 105,566

7 Claims. (Cl. 51—105)

1. In a grinding machine, a base, a rotatable grinding wheel, a transversely movable slide therefor, a rotatable work supporting spindle, a motor which is arranged continuously to rotate said spindle, a chuck on said spindle, means including a fluid pressure piston and cylinder to control said chuck to clamp or release a work piece thereon, means including a fluid pressure operated piston and cylinder operatively connected to move the wheel slide transversely in either direction, an electrical control mechanism for said fluid pressure wheel feeding mechanism, a control valve to admit fluid to said chuck operating cylinder, and a manually operable control lever which is arranged when moved in one direction to operate said valve and when moved in a second direction to actuate said electrical mechanism to control the wheel feeding movement.

2,101,791

ALTERED TUNG OIL AND PROCESS OF MAKING SAME

Carleton Ellis, Montclair, N. J., assignor to Ellis-Foster Company, a corporation of New Jersey

No Drawing. Application September 29, 1934, Serial No. 746,145

10 Claims. (Cl. 87—12)

1. A siccative composition comprising the reaction product of a polyphenol of the class consisting of orcinol, phloroglucinol, resorcinol, pyrocatechol and hydroquinone, with a material containing tung oil, which composition is produced by heating the polyphenol with the tung oil material in the presence of an acid condensing agent at temperatures sufficiently high to cause a chemical reaction but not exceeding about 150° C., and which composition is thicker than the original raw oil and is miscible with glyceride oils, and when dissolved in a solvent to which driers are added and then applied to a surface in a thin film, dries to a frost-free surface.

2,101,792

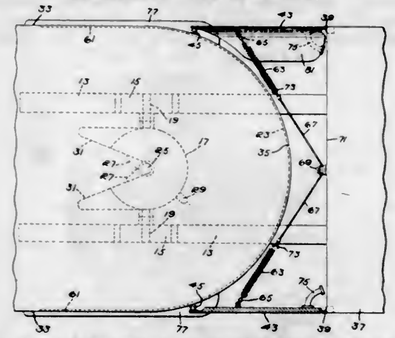
ALKYD RESIN COATING AND COMPOSITION OF IMPROVED ALKALI RESISTANCE AND PROCESS OF MAKING SAME

Carleton Ellis, Montclair, N. J., assignor to Ellis-Foster Company, a corporation of New Jersey

No Drawing. Application November 19, 1936, Serial No. 111,741

16 Claims. (Cl. 134—26)

13. A resinous coating composition of improved alkali resistance comprising a solution in an organic solvent of the homogeneous fused products of gelled fatty oil acids modified alkyd resin and rosin ester.



2,101,793

TRACTOR AND TRAILER

Fred F. Field, Jr., Brockton, Mass., assignor to Dutchland Farms, Inc., Brockton, Mass., a corporation of Massachusetts

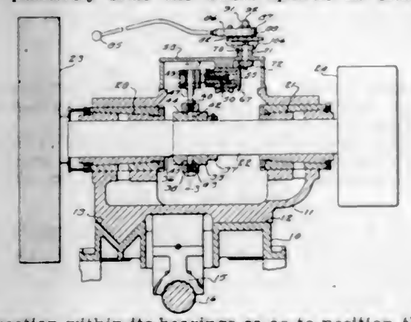
Application June 29, 1936, Serial No. 87,831

10 Claims. (Cl. 280—33.1)

1. A vehicle having, in combination, a tractor, a trailer connected to said tractor for relative swiveling in the plane of the road, said tractor and trailer having bodies, the rearward end of the tractor body being spaced from the forward end of the trailer body at the sides of the vehicle, a swinging door at each side of the vehicle hinged to one of said bodies for closing the space between them, and spring means connecting a door at one side of the body with a door at the opposite side of the body for yieldingly holding said doors in closed position.

2,101,794

GRINDING WHEEL POSITIONING MECHANISM



Carl G. Flygare, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

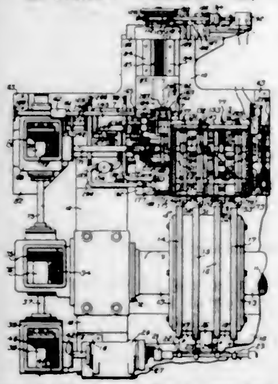
Application August 15, 1935, Serial No. 36,385

4 Claims. (Cl. 51—72)

1. In a grinding machine, a transversely movable wheel slide, spindle bearings in said slide, a rotatable wheel spindle supported in said bearings and arranged for a longitudinal axial positioning movement relative thereto, a rotatable grinding wheel carried by said spindle, a rotatable end thrust member on said spindle, a yoked member pivotally mounted on said slide and arranged to move the spindle axially within its bearings, a nut and screw mechanism to move

said yoked member, and means including a manually operable lever to actuate said nut and screw to positively slide the wheel spindle in either

direction within its bearings so as to position the grinding wheel into a predetermined position relative to the work piece and to positively hold it in said adjusted position during grinding.



2,101,795

GRINDING WHEEL TRUING APPARATUS

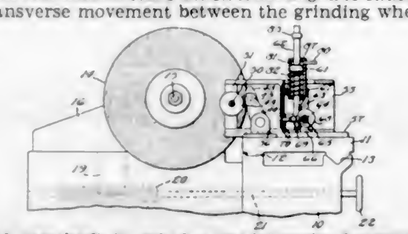
Carl G. Flygare and Herbert A. Silven, Worcester, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application October 8, 1935, Serial No. 44,069

15 Claims. (Cl. 125—11)

2. A truing apparatus for a grinding machine comprising a rotatable grinding wheel, means including an electric motor to rotate said wheel, a truing tool arranged to true the operative face of said grinding wheel, means to traverse the truing tool longitudinally relative to the grinding wheel to true the operative face thereof, means to move said truing tool to and from an operating position, and a control mechanism operated in timed relation with said latter means to change the speed of said motor so as to rotate the grinding wheel at a predetermined truing speed.

2,101,796



CAM GRINDING APPARATUS

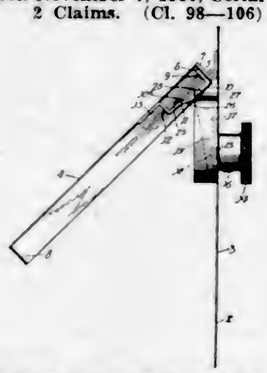
Clarence J. Green, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application November 27, 1936, Serial No. 112,949

10 Claims. (Cl. 51—101)

1. In a camshaft grinding machine, a rotatable grinding wheel, a longitudinally movable rock bar, a rotatable master camshaft on said bar having a plurality of master cams thereon, a rotatable work support on said bar which is arranged to support a camshaft in axial alignment with said master camshaft, means synchronously to rotate said camshaft and master camshaft, a rotatable master cam follower roller associated with said master cams which is arranged to cause a transverse movement between the grinding wheel

and camshaft to grind a predetermined contour on a cam blank, and means to move said master cam roller transversely during the grinding operation to produce a relative approaching movement between the camshaft support and grinding wheel to grind the cam blank to a predetermined size.



2,101,797

SHUTTER FOR RADIATOR ENCLOSURES AND THE LIKE

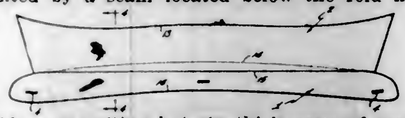
John Kacena, Chicago, and Edward E. Kelly, Oak Park, Ill., assignors to Crane Co., Chicago, Ill., a corporation of Illinois

Application November 7, 1936, Serial No. 109,646

2 Claims. (Cl. 98—106)

1. A radiator enclosure including a front plate having openings therethrough, a shutter swivelably mounted on the back of the said plate for controlling the passage of air through the said openings and means comprising an eccentrically positioned cam rotatably mounted in said plate and operable from the front of the said plate, the said cam being eccentrically positioned with relation to its axis of rotation and having an annular relieved surface spirally inclined whereby upon rotation in one direction of the said cam the said shutter is movable within said enclosure and upon rotation in a reverse direction the said shutter is latched to prevent such movement.

2,101,798



COLLAR AND METHOD OF MAKING THE SAME

Louis P. Madsen, Troy, N. Y., assignor to Cluett, Peabody & Co., Inc., Troy, N. Y., a corporation of New York

Application February 19, 1936, Serial No. 64,695

2 Claims. (Cl. 2—143)

1. A multi-ply fold-over collar of the fused, self-stiffened type comprising a top portion including a facing ply and a rear ply, the facing ply being wider than the rear ply at the central portion at least of the collar, an integrating stiffening element substantially coextensive with the facing ply, a band portion comprising a facing ply, an interliner, and a rear ply, the upper edge of the front ply of the band being concave and the upper edge of the rear ply of the band being convex, the facing plies of the top and band being united by a seam located below the fold line,

said seam uniting but six thicknesses of material, and the rear plies of the top and band being united by a curved seam which substantially defines the fold line, said seam uniting but five thicknesses of material,—the integrating stiffening element extending uninterruptedly across the fold line and permanently uniting the front ply of the top directly to both the rear ply of the top and the upper part of the rear ply of the band.

2,101,799

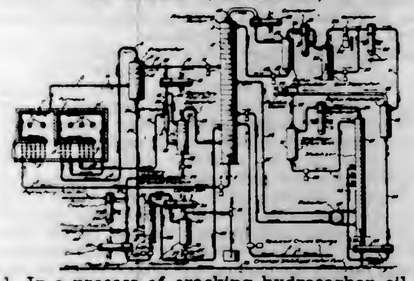
BRUSH

Clarence G. Rowland, Newington Junction, Conn., assignor to The Fuller Brush Company, Hartford, Conn., a corporation of Connecticut

Application January 16, 1935, Serial No. 2,073

5 Claims. (Cl. 15—205)

1. A brush back comprising a strip of material having a lengthwise groove and having a continuously thickened edge extending lengthwise thereof to provide a restricted pressure neck to retain the bristles in place.



2,101,800

METHOD OF CRACKING HYDROCARBON OILS

Hermann C. Schutt, North Tarrytown, N. Y., assignor, by mesne assignments, to Gyro Process Company, Detroit, Mich., a corporation of Michigan

Application October 29, 1934, Serial No. 750,426

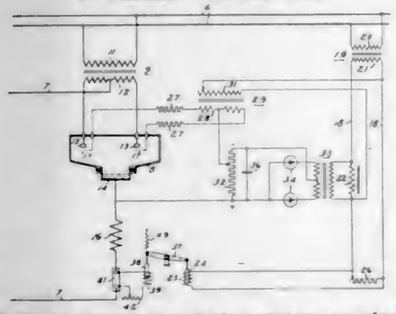
2 Claims. (Cl. 196—60)

1. In a process of cracking hydrocarbon oil to form desired lower boiling hydrocarbons including the steps of passing a stream of hydrocarbon oil through a conversion zone and subjecting the stream while passing through said zone to liquid phase cracking conditions of temperature and pressure for a period of time sufficient to form lower boiling hydrocarbons from higher boiling hydrocarbons of the oil, reducing the pressure on the products of the cracking operation to effect a separation of the oil into vapors and a primary liquid residue, subjecting vapors separated from the oil to vapor phase cracking conditions of temperature and pressure for a period of time sufficient to form desired lower boiling hydrocarbons from higher boiling hydrocarbons of the vapors, cooling the products of the vapor phase cracking operation with cooler oil sufficiently to condense the refractory higher boiling hydrocarbons of the cracked vapors, separating the condensed refractory higher boiling hydrocarbons from the uncondensed cracked vapors, passing the uncondensed cracked vapors to a fractionating zone, dephlegmating the vapors in the fractionating zone and recovering from the uncondensed overhead products of the fractionating zone the desired low boiling hydrocarbons; the improvement comprising withdrawing from the fractionating zone an intermediate fractional oil condensate lower boiling than said refractory higher boiling hydrocarbons and employing said condensate as said cooler condensing oil and as reflux oil in the separation of said refractory higher boiling hydrocarbons from the uncondensed cooled cracked vapors, diverting the condensed refractory higher boiling hydrocarbons as a secondary residue from the process, passing the primary liquid residue to a separate distillation zone, vaporizing primary lower boiling hydrocarbons of the residue in said zone, separately withdrawing the vapors and unvaporized residue from the distillation zone, cooling the vapors to condense the same, passing condensate resulting from the cooling of said vapors to said fractionating zone and withdrawing from said fractionating zone a stream of hydrocarbon oil for passage to said liquid phase conversion zone.

2,101,801

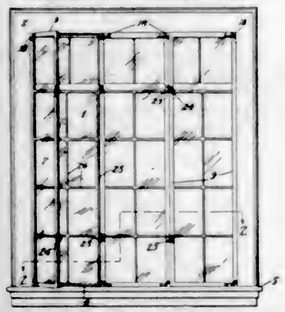
KNITTING MACHINE

Frank G. Weisbecker, Glenside, Pa., assignor to Arcadia Hosiery Co., Lansdale, Pa., a corporation of Pennsylvania



Application December 20, 1935, Serial No. 55,473

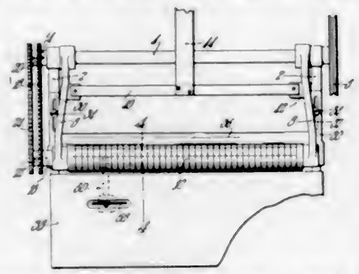
21 Claims. (Cl. 66—126)



14. For use in a yarn carrier of straight knitting machines, a guide cooperating with said carrier and forming a yielding means for laying the yarn of said carrier along the sinkers and needles of the knitting machine, said guide at least in part comprising a helical coil of resilient material having a non-circular cross-sectional shape.

2,101,802
RECTIFYING SYSTEM
Harold Winograd, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application June 18, 1934, Serial No. 731,105
15 Claims. (Cl. 175—363)

2. In an electric translating system, an electric valve having an anode with an associated control electrode and a cathode, and a control electrode circuit for said valve comprising a source of alternating current for impressing therefrom superimposed alternating and direct voltage components between said control electrode and said cathode to control the operation of said valve, and means responsive to an operating condition of said valve for simultaneously varying said voltage components independently of the magnitude of the voltage of said source to regulate the flow of current through said valve.

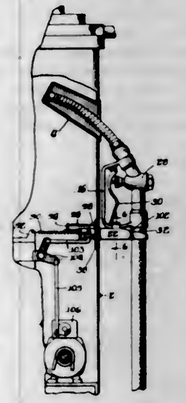


2,101,803
DOUBLE WINDOW
John K. Ames, Machias, Maine, assignor to Burrowes Corporation, Portland, Maine, a corporation of Maine
Application August 30, 1935, Serial No. 38,548
9 Claims. (Cl. 189—65)

1. A metal sash having a pane receiving recess and a weatherstrip receiving recess, said sash presenting a slender border for the pane and comprising front and rear strips and a concealed reenforcement defining with said strips said recesses and said rear strip and said reenforcement being detachably united.

2,101,804
BOOKBINDING
Paul W. Bidwell, Holyoke, Mass.
Application June 17, 1935, Serial No. 26,893
3 Claims. (Cl. 11—1)

1. An apparatus for binding the perforated leaves of a book with a preformed spiral binding member comprising in combination, a horizontal support for said book, a grooved roll journalled for rotation adjacent said support, an arm swingable relative to said support, a second grooved roll journalled for rotation therein for co-operating with the first-named roll to advance a spiral binding along the perforations of the leaves of a book on said support, electrically operated means to swing said arm to separate said rolls when a binding has advanced along said



support a predetermined distance, the said means including a circuit-closing device on said support engageable by and actuated by the spiral binding as the same is advanced along the support a predetermined distance and a circuit connected to the electrically-operated means and circuit-closing device, all adapted and arranged whereby the circuit-closing device is actuated by a spiral binding when the same has advanced along the support a predetermined distance to cause the said rolls to be separated.

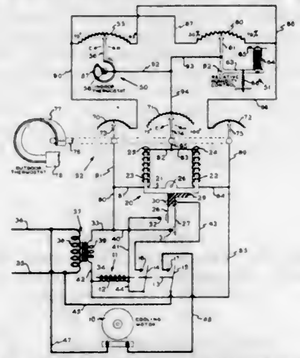
2,101,805
PROCESS OF TREATING LEGUMINOUS MATERIALS
Michele Bonotto, Evansville, Ind., assignor to American Soya Products Corporation, Evansville, Ind., a corporation of Indiana
No Drawing. Application August 28, 1934, Serial No. 741,822
3 Claims. (Cl. 99—98)

1. The process of treating leguminous products comprising the subjection of a charge of leguminous material containing bodies possessing an acrid taste and dark-colored substances, to the action of an aqueous solution of sulphur dioxide of a concentration between 0.02% and 0.25% as sulphur dioxide, and then washing said product in pure water.

2,101,806
LIQUID DISPENSING APPARATUS
William M. Carroll, Fort Wayne, Ind., assignor to S. F. Bowser & Company, Inc., Fort Wayne, Ind., a corporation of Indiana
Application February 16, 1935, Serial No. 6,779
27 Claims. (Cl. 221—95)

1. In a control device for a liquid dispensing system, in combination, a liquid dispensing nozzle provided with a nozzle valve having an actuatable control member, liquid measuring means in the dispensing system, movable indicating means adapted to move from an initial predetermined position to indicate liquid dispensed, reset mechanism for resetting the indicating means to initial position, supporting means for the nozzle when not in use including relatively movable members having means for locking the nozzle valve actuating means in inoperative position when the nozzle is on its supporting means, and means interconnecting the reset mechanism with the movable one of said relatively movable members including means for preventing the unlocking of said nozzle valve actuating means until actuation of the reset mechanism.

2,101,807
FERTILIZER
John W. Corey, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
Application May 13, 1935, Serial No. 21,248
14 Claims. (Cl. 71—24)



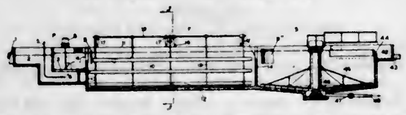
Control Number	Original Charge					Conditions			Product				
	Weight of Peat (dry basis) (Grams)	Weight of Water (Grams)	Nitrogenous Material (Grams)	Weight of Nitrogen (Grams)	Nitrogen Content (Per Cent)	Temperature (°C)	Time	Rate of Heating	Weight of Product (Grams)	Loss in Weight (Grams)	Loss in Weight (Per Cent)	Weight of Nitrogen in Product (Grams)	Nitrogen in Product (Per Cent)
1	—	—	Urea (Solid)	10.0	46.6	250 to 230	Atm.	Rapid (Less than 1 hour)	49.6	37.15	23.84	18.05	37.0
2	67.5	75.0	Urea (Solid)	42.0	21.0	225	Atm.	½	79.0	16.96	9.03	17.82	21.1
3	60.0	0	Urea (Solid)	42.0	15.73	220	Atm.	¼	73.0	14.34	11.28	10.45	33.0
4	35.0	75.0	Urea (Solid)	10.5	4.3	225 to 100	5	5.3	38.0	8.41	8.76	7.55	32.0
5	30.0	30	Urea (Solid) 40 cc. (5.34 grams)	7.5	11.65	231 to 230	Atm.	2 to 1	30.1	13.75	11.05	7.63	65.5

3. A fertilizer prepared by heating a mixture of peat and urea to a temperature at which the urea is decomposed with formation of nitrogen compounds which are relatively insoluble in water.

7. A method comprising mixing urea with a porous organic waste material and heating the mixture to a temperature above 180° C.

2,101,808
AUTOMATIC AIR CONDITIONING SYSTEM
Lewis L. Cunningham, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application December 17, 1934, Serial No. 757,854
19 Claims. (Cl. 236—44)

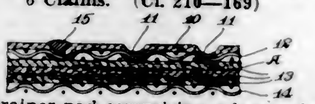
9. In combination, means in control of the condition of a space, electrical means in control thereof, a variable resistance space temperature actuated controller, a variable resistance outdoor temperature responsive controller, a variable resistance space relative humidity responsive controller, and electrical connections con-



necting all of said variable resistance controllers to the electrical means.

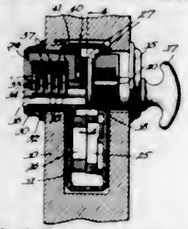
2,101,809
POWDER BOX
Alexander H. Dreux, Orchard Park, and Joseph N. Royal, Buffalo, N. Y., assignors, by mesne assignments, to F. N. Burt Company, Inc., Buffalo, N. Y., a corporation of Delaware
Application October 28, 1935, Serial No. 47,138
19 Claims. (Cl. 229—5.5)

1. In a box, in combination, a drum, a closure therefor having a wedge plug engaging the end part of the interior of said drum to permanently expand the same and to cause constant pressure between the closure and drum, and a plurality of spaced teeth extending continuously around the wedge plug and indenting the drum to securely hold the parts together, one of the lower of said teeth being of greater diameter than that next above.



2,101,810
FLOCCULATION
Anthony J. Fischer, Jackson Heights, N. Y., assignor to The Dorr Company, Inc., New York, N. Y., a corporation of Delaware
Application November 18, 1935, Serial No. 50,337
12 Claims. (Cl. 210—16)

11. Apparatus for flocculating and clarifying liquids, which comprises a basin divided into a longitudinally-extending flocculation zone and a sedimentation zone, a feed of liquid to be flocculated for the head section of the flocculation zone whereby the liquid follows a general flow-path through the flocculation zone entering at one end section and exiting from the other end section directly into the sedimentation zone, an outflow outlet for clarified liquid from the sedimentation zone, a sediment-discharge means for the sedimentation zone, travelling means for impelling to discharge

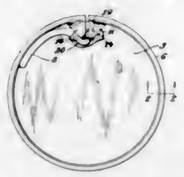


sediment in the sedimentation zone; and flocculation means comprising groups of a plurality of assemblies of aligned bladed elements within the flocculation zone and extending substantially parallel to the longitudinal axis of that zone, with motivating means for moving said bladed elements in paths that extend at right angles to said longitudinal axis whereby the liquid of the flocculation zone substantially throughout its length is gently agitated transversely to the direction of its flowpath.

2,101,811
FILTER PAD
Alvin W. Franzmeier, Rosemount, Minn.
Application December 28, 1935, Serial No. 56,509
6 Claims. (Cl. 210—169)

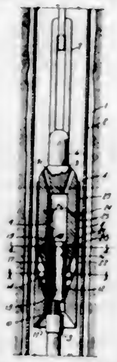
1. A strainer pad comprising a layer of gauze, and a layer of filtering material free from said gauze through the greater area thereof, said filtering material extending into said gauze at spaced intervals to reinforce the pad.

2,101,812
DOOR LOCK
Herman H. Kistner, Baltimore, Md., assignor to Kistner Lock & Appliance Company, a corporation of Maryland
Application January 29, 1936, Serial No. 61,382
5 Claims. (Cl. 70—370)



1. In a door lock having means engaging the periphery of a cylinder lock for retaining the cylinder from being unscrewed from the lock casing when the door is closed, the combination of a cylinder lock, guard means fixed on the inner end of the cylinder for engaging the door lock inner face of the casing to prevent forcible unscrewing of the cylinder.

2,101,813
RECEPTACLE AND CLOSURE
William Lockhart, Cleveland, Ohio, assignor to Cornell Securities Corporation, Cleveland, Ohio, a corporation of Delaware
Application May 2, 1935, Serial No. 19,440
7 Claims. (Cl. 220—61)

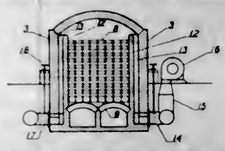


1. A device for removably clamping a cover on the open end of a metallic receptacle including a split locking ring having portions engaging the cover and the receptacle to press the same together when the ring is contracted, lugs extending inwardly from the ends of the ring defining the split and means for contracting and/or expanding the ring, said means, including a lever, having an arcuate bearing formed therein near one end, a member carried by one of said lugs and having a driving connection with said lever through the bearing, and a toggle pivotally connected with said lever and said other lug.

2,101,814
RECEPTACLE AND CLOSURE
William Lockhart, Cleveland, Ohio, assignor to Cornell Securities Corporation, Cleveland, Ohio, a corporation of Delaware
Application May 2, 1935, Serial No. 19,441
11 Claims. (Cl. 220—61)

1. A device for removably clamping a cover on the open end of a receptacle including a split locking ring having portions engaging the cover and a portion of the receptacle to press the same together when the ring is contracted lugs extending inwardly from the ends of the ring, and means for contracting the ring including a lever having a pair of curved guides formed therein for sliding engagement with projections on said lugs, a projection on each of said lugs, and a member carried by said lever and connected with each of said lugs.

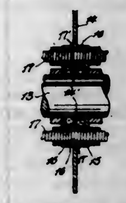
2,101,815
SLIP SOCKET
Louis V. Mallory, Salina, Kans., assignor of one-half to Grover C. Dale, Salina, Kans.
Application November 25, 1936, Serial No. 112,833
11 Claims. (Cl. 294—102)



9. A slip socket of the character described including a body member having a bore therein and having passageways leading from the upper end of the bore for venting foreign matter, ball races in the body member communicating with said bore, balls in said races to contact an object

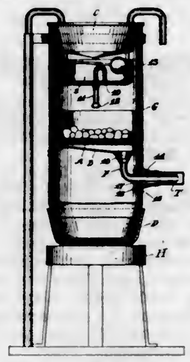
projecting into said bore, and a trap sleeve slidably mounted in said bore for selectively covering said ball races.

2,101,816
GALVANIZING COMPOSITION
Frank D. McBride, Philadelphia, Pa.
No Drawing. Application January 21, 1937, Serial No. 121,593
3 Claims. (Cl. 148—24)



1. A galvanizing composition comprising an alloy of lead, tin and zinc in which the zinc is present in amount not less than 40% of the alloy, the lead and tin forming the balance of the alloy, and a flux capable of dissolving metal oxide in a dry state admixed with the alloy.

2,101,817
REGENERATOR
William A. Morton, Mount Lebanon, Pa., assignor to Amco, Incorporated, Pittsburgh, Pa., a corporation of Pennsylvania
Application May 24, 1935, Serial No. 23,196
7 Claims. (Cl. 263—19)



1. In a regenerator, top, side and bottom walls forming a chamber having top and bottom passages, a checker-work mounted in said chamber having walls in spaced relation with the walls of the chamber, vertically extending partition members dividing said spaces into vertical ducts communicating with a common chamber at the top and having air supply means at the bottom, means for drawing air from the bottom of the checker-work to the common chamber at the top, and means independent thereof for drawing quantities of air through the vertical ducts intermediate the checker-work and outer walls of the regenerator chamber.

2,101,818
CALCULATING MACHINE
Austin A. Overbury, East Orange, N. J., assignor to Monroe Calculating Machine Company, Orange, N. J., a corporation of Delaware
Application January 23, 1936, Serial No. 60,531
1 Claim. (Cl. 235—133)

In power transmission means for transfer mechanism of calculating machines, a rotary shaft, a series of elements fixed to said shaft and having apertures, a series of carry members arranged longitudinally of and loose on said shaft and having apertures, and longitudinal coiled springs engaging aligned apertures of said elements and said carry members for transmitting rotary movement and for dampening vibration.

2,101,819
EXTRACTOR
Victor H. Roehrich, St. Paul, Minn.
Original application June 5, 1929, Serial No. 368,727. Divided and this application January 5, 1935, Serial No. 554
6 Claims. (Cl. 87—6)

1. An extractor including, an evaporating dish adapted to be heated by a heater, a closed casing extending above said dish and sealed with respect thereto, a filtering means adapted to support the material to be extracted mounted within said casing above the level of said dish, a condenser mounted in said casing above the level of said filtering means, an intermediate collector and intermittently operable dispenser secured below the level of said condenser to collect moisture draining from said condenser and positioned between said condenser and said filtering means, an outlet extending through said casing below the level of said filtering means and means beneath said filtering means and connected with said outlet for drawing off the solvent from said filtering means to leave the extracted material in the evaporating dish virtually dry.

2,101,820
PROCESS FOR THE PREPARATION OF POLYMERIZABLE UNSATURATED COMPOUNDS
John C. Woodhouse, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 5, 1933, Serial No. 701,053
10 Claims. (Cl. 260—106)

6. A process of preparing a methyl ester of methacrylic acid which comprises dehydrogenating isobutyraldehyde by passing it in the vapor phase over a dehydrogenation catalyst at a temperature between 200 and 500° C., and subsequently oxidizing the product and esterifying the oxidation product with methanol.

2,101,821
MANUFACTURE OF UNSATURATED ORGANIC COMPOUNDS
John William Croom Crawford, Norton-on-Tees, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application November 5, 1935, Serial No. 48,448. In Great Britain November 7, 1934
30 Claims. (Cl. 260—106)

1. A process for the preparation of unsatu-

rated organic compounds which comprises reacting a ketone cyanohydrin with a strongly concentrated acid selected from the group consisting of sulphuric acid, sulfonic acids, alkyl sulphuric acids, phosphoric acid and hydrogen chloride at a temperature below approximately 140° C.

2,101,822

MANUFACTURE OF UNSATURATED ORGANIC AMIDES

John William Croom Crawford and James Grigor, Norton-on-Tees, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application May 7, 1936, Serial No. 78,488. In Great Britain May 10, 1935
13 Claims. (Cl. 260—124)

1. Process for the manufacture of unsaturated amides from ketone cyanohydrins which comprises heating a mixture of the ketone cyanohydrin with an acid chosen from the group consisting of sulphuric acid, oleum, alkyl sulphuric acid and mixtures thereof, to a temperature of 140°–180° C. for a period of time not substantially greater than 10 minutes.

2,101,823

PROCESS OF PREPARING CYANHYDRINS

Harry R. Dittmar, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

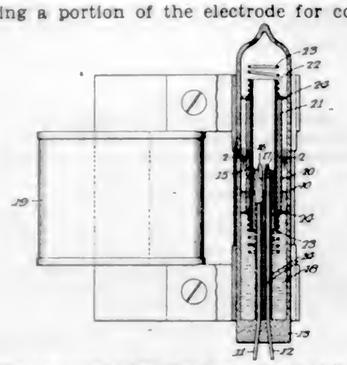
No Drawing. Application April 17, 1934, Serial No. 720,945
6 Claims. (Cl. 260—99.30)

1. In a process of preparing a cyanhydrin in accord with the equation:

in which

refers to a symmetrical or asymmetrical alkyl, aryl, aralkyl, or cyclic ketone or aldehyde, the steps which comprise initiating the reaction by dissolving at least a portion of the catalyst in the product of the reaction, adding the resulting solution, together with any undissolved catalyst to the

containing compound, and subsequently introducing the HCN.



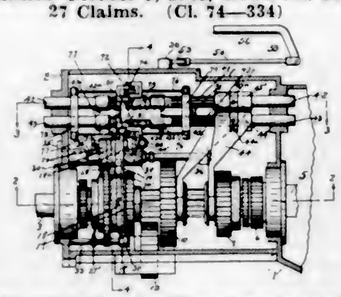
2,101,824

MERCURY SWITCH

Uno C. Hedin and Carl H. Larson, Elkhart, Ind., assignors to The Adlake Company, a corporation of Illinois

Application June 10, 1935, Serial No. 25,818
12 Claims. (Cl. 200—112)

1. A mercury switch of the class described comprising a vertical switch envelope, a mercury fill, a pair of electrodes of opposite polarity projecting through the fill, means for shifting the mercury level to bridge the electrodes with mercury and hence close the circuit through the electrodes, and an insulating sleeve on each electrode extending above the low level of the fill and exposing a portion of the electrode for contact



with the mercury when the mercury is at its high level.

2,101,825

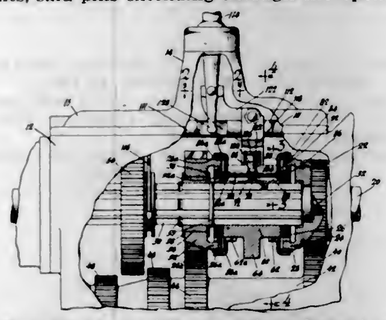
AUTOMATIC GEAR SHIFTING MECHANISM

Earl A. Thompson, Portland, Oreg., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application October 9, 1923, Serial No. 667,478
27 Claims. (Cl. 74—334)

1. The combination with a power transmission including a pair of main shafts, gears on said shafts adapted to establish a drive between the shafts, means including a control lever for connecting and disconnecting said drive, of synchronizing means for establishing the desired speed relation between the main shafts before they are placed in driving relation, said synchronizing means comprising a conical member, a member normally freely rotatable on the conical member, and leverage multiplying means to produce engagement between the conical member and the normally freely rotatable member during the synchronizing period.

2,101,826



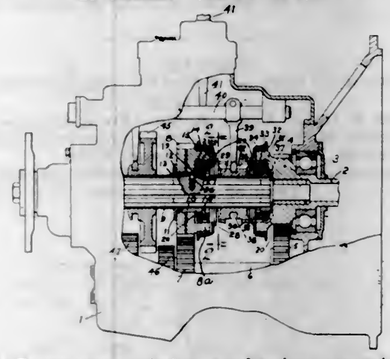
SYNCHRONIZING CLUTCH MECHANISM

Earl A. Thompson, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application November 9, 1935, Serial No. 48,971
6 Claims. (Cl. 192—53)

1. In variable speed power transmission mechanism, the combination of a shaft; axially spaced and axially fixed positive clutch elements capable of rotation independently of said shaft around the axis thereof; a positive coupling element slidably keyed to said shaft and adapted to be interlocked selectively with either of said axially fixed positive clutch elements, said slidable coupling element having openings parallel with the axis of the shaft; friction clutch elements rigid with said axially fixed positive clutch

elements; axially movable friction clutch elements arranged to cooperate with said axially fixed friction clutch elements; pins rigidly connecting said axially movable friction clutch elements, said pins extending through the openings



in the slidable positive coupling element each pin having spaced checking shoulders for cooperating with the edges of said openings, the cross-sectional dimensions of the pins between the spaced checking shoulders being less than that of the openings in the slidable positive coupling element.

2,101,827

SYNCHRONIZED POWER TRANSMISSION MECHANISM

Earl A. Thompson, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application August 27, 1928, Serial No. 302,228
11 Claims. (Cl. 74—339)

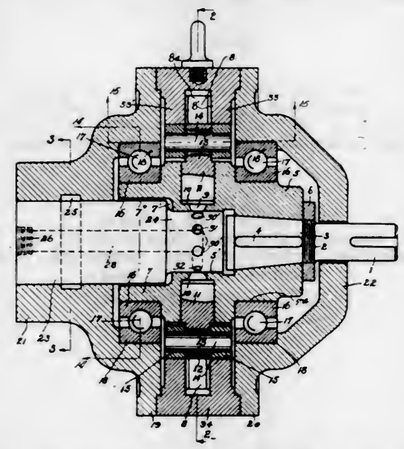
1. Power transmission mechanism comprising drive and driven members, a shiftable element operatively associated with said members for establishing a driving relation therebetween, synchronizing means including a pair of coacting friction elements for establishing the desired speed relation between said members before said driving relation is established, a driving connection between one of said friction elements and one of the members, said driving connection constructed and arranged to allow restricted relative angular and axial movement and to convert relative angular movement into an axial movement of the friction element, means associated with the shiftable element causing positive release of the friction elements at the proper time, and means for effecting operation of the synchronizing means and shifting the shiftable element.

2,101,828

VAT DYE COMPOSITION

Harold W. Wass and Howard J. Rupright, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Michigan

No Drawing. Application August 5, 1935, Serial No. 34,723
20 Claims. (Cl. 8—6)



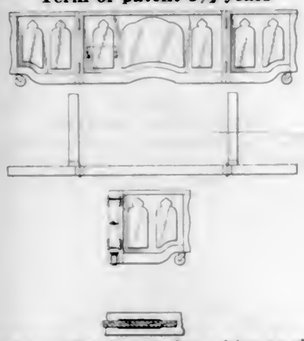
1. A dye paste comprising a thioindigoid vat dye and a hydrobenzene compound selected from the class consisting of hydrobenzene alcohols and their esters to which paste a printing gum is to be added to obtain a composition useful in printing cellulose fibers.

2,101,829

HYDRAULIC MOTOR

Elek K. Benedek, Bucyrus, Ohio

Application May 10, 1934, Serial No. 724,933
7 Claims. (Cl. 121—61)



6. In a high pressure, rotary, radial piston hydraulic motor, a barrel comprising a rigid cylindrical portion having circumferentially spaced radial cylinders therein, valve means for the cylinders, anti-friction bearing means at opposite sides of the plane of the cylinders and supporting the barrel for rotation about its axis, a radial flange on said cylindrical portion in the plane of the cylinders, and having radial guideways respectively aligned with the cylinders, plungers in the cylinders, each plunger having a portion reciprocable in and guided by an associated guideway and substantially coextensive axially of the barrel with the flange, crosspins anti-frictionally mounted in the said portions of the plungers and extending parallel to the barrel axis beyond the lateral limits of the flange, rollers on the respective ends of each crosspin and having their inner faces in substantially face to face abutting relation respectively to the lateral faces of said portions, axially spaced parallel reactance means surrounding the barrel and having side walls extending radially of the flange alongside the radial faces thereof and in substantially abutting relationship thereto, said reactance means engaging the plunger rollers substantially contiguous to the lateral faces of the flange for relative rolling cooperation therewith for effecting rotation of the barrel.

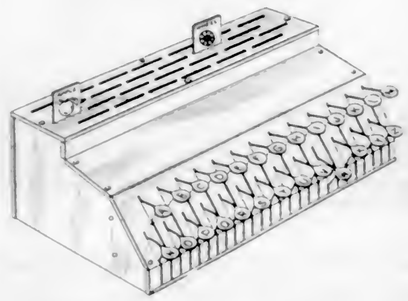
DESIGNS

DECEMBER 7, 1937

107,307
DESIGN FOR A BIER
Earl C. Babcock, Painesville, Ohio
Application February 2, 1937, Serial No. 67,402
Term of patent 3½ years

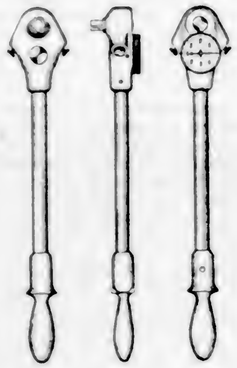
The ornamental design for a bier as shown.

107,308
DESIGN FOR A SHOE
Benjamin Benjamin, New York, N. Y.
Application October 23, 1937, Serial No. 72,385
Term of patent 3½ years



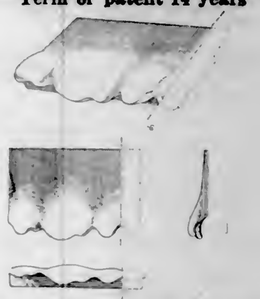
The ornamental design for a shoe substantially as shown.

107,309
DESIGN FOR A METALLIC FILIGREE BAND
August Brackman, New York, N. Y.
Application May 24, 1937, Serial No. 69,508
Term of patent 3½ years



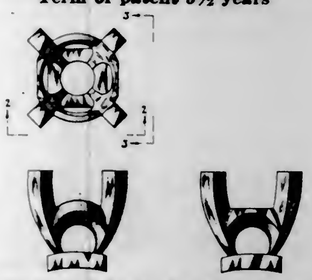
The ornamental design for a metallic filigree band as shown.

107,310
DESIGN FOR A TOY ALPHABET PICTURE REGISTER OR SIMILAR ARTICLE
Daniel C. Cahalane, Hillsdale, N. J., assignor to The Hoge Manufacturing Company, Inc., a corporation of New York
Application May 14, 1937, Serial No. 69,359
Term of patent 7 years



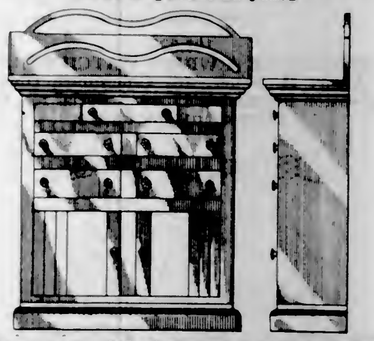
The ornamental design for a toy alphabet picture register or similar article, as shown and described.

107,311
DESIGN FOR A TORQUE MEASURING WRENCH
Allen I. Dunn, Cedar Rapids, Iowa, assignor to Cedar Rapids Engineering Company, Cedar Rapids, Iowa, a corporation of Iowa
Application October 13, 1937, Serial No. 72,144
Term of patent 7 years



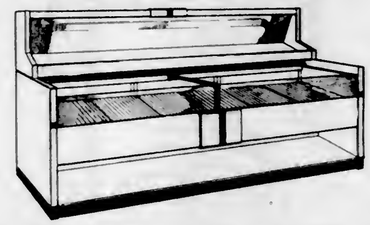
The ornamental design for a torque measuring wrench as shown.

107,312
DESIGN FOR A STRIP SHINGLE OR THE LIKE
Albert C. Fischer, Chicago, Ill.
Application April 19, 1937, Serial No. 68,862
Term of patent 14 years



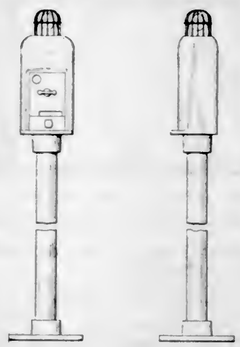
The ornamental design for a strip shingle or the like substantially as shown and described.

107,313
DESIGN FOR A JEWELRY SETTING OR SIMILAR ARTICLE
Jacob J. Fischer, Newark, N. J.
Application September 24, 1937, Serial No. 71,767
Term of patent 3½ years



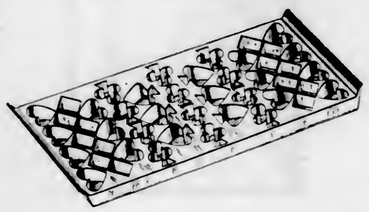
The ornamental design for a jewelry setting or similar article as shown.

107,314
DESIGN FOR A WARDROBE
George W. Harding, Baltimore, Md.
Application July 9, 1937, Serial No. 70,333
Term of patent 14 years



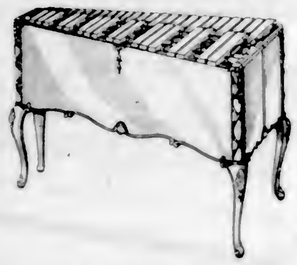
The ornamental design for a wardrobe as shown.

107,315
DESIGN FOR A REFRIGERATED VEGETABLE DISPLAY CASE
George J. Hopkins, Kendallville, Ind., assignor to McCray Refrigerator Company, Kendallville, Ind., a corporation of Indiana
Application September 27, 1937, Serial No. 71,804
Term of patent 7 years



The ornamental design for a refrigerated vegetable display case as shown and described.

107,316
DESIGN FOR A PARKING METER
Charles H. Martin, Springfield, Mass.
Application October 23, 1937, Serial No. 72,391
Term of patent 7 years



The ornamental design for a parking meter, as shown.

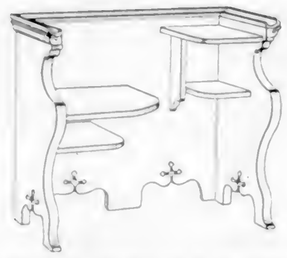
107,317
DESIGN FOR A REFRIGERATING MOLD
Jose H. de Murguiondo, Washington, D. C.
Application October 21, 1937, Serial No. 72,353
Term of patent 7 years

The ornamental design for a refrigerating mold, as shown.

107,318
DESIGN FOR A MARIMBA
Clair Omar Musser, Chicago, Ill.
Application September 20, 1937, Serial No. 71,698
Term of patent 3½ years

The ornamental design for a marimba, substantially as shown and described.

107,319
DESIGN FOR A DECORATIVE MIRROR
Frank H. Nonnenbacher, Brooklyn, N. Y.
Application April 28, 1937, Serial No. 69,013
Term of patent 3½ years

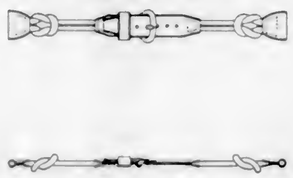


The ornamental design for a decorative mirror substantially as shown.

107,320
DESIGN FOR A DECORATIVE MIRROR
Frank H. Nonnenbacher, Brooklyn, N. Y.
Application April 28, 1937, Serial No. 69,014
Term of patent 3½ years

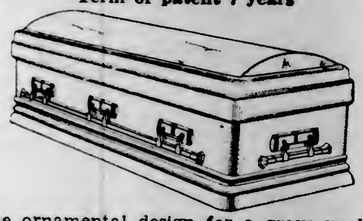
The ornamental design for a decorative mirror substantially as shown.

107,321
DESIGN FOR A TELEPHONE BOOTH
Charles S. Potts, Hastings, Mich., assignor to Grand Rapids Bookcase & Chair Co., Hastings, Mich., a corporation of Michigan
Application October 18, 1937, Serial No. 72,247
Term of patent 7 years



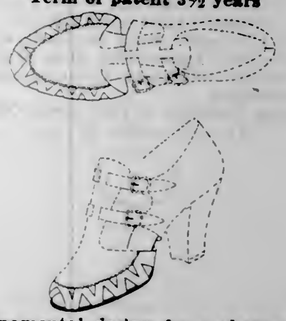
The ornamental design for a telephone booth, as shown.

107,322
DESIGN FOR A TIRE
Ralph M. Reel, Granville, Ohio, assignor to The Pharis Tire & Rubber Company, Newark, Ohio, a corporation of Ohio
Application May 1, 1937, Serial No. 69,118
Term of patent 14 years



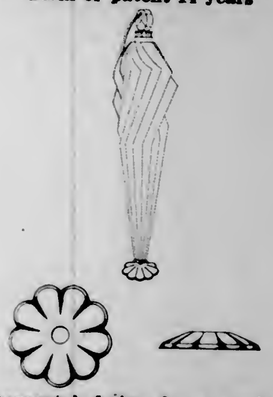
The ornamental design for a tire, as shown.

107,323
DESIGN FOR A WRIST WATCH STRAP
Albert H. Sauer, Jr., Cincinnati, Ohio
Application September 17, 1936, Serial No. 64,909
Term of patent 7 years



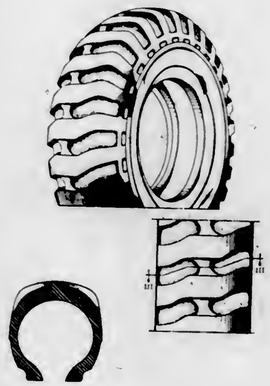
The ornamental design for a wrist watch strap, substantially as shown.

107,324
DESIGN FOR A GRAVE VAULT
Norman J. Schneiker, Galion, Ohio, assignor to Central Ohio Steel Products Co., Galion, Ohio, a corporation of Ohio
Application October 13, 1937, Serial No. 72,150
Term of patent 7 years



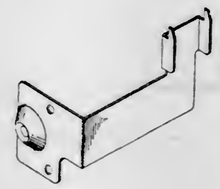
The ornamental design for a grave vault, as shown.

107,325
DESIGN FOR A SHOE
Charles I. Stoddard, Quincy, Mass., assignor to Charles Cushman Company, Boston, Mass., a corporation of Maine
Application November 1, 1937, Serial No. 72,547
Term of patent 3½ years



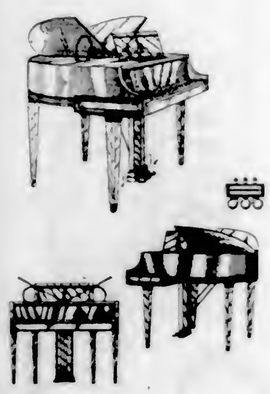
The ornamental design for a shoe, as shown and described.

107,326
DESIGN FOR A COMBINED UMBRELLA AND SUPPORT
Della P. Talamantes, Alhambra, Calif.
Application August 3, 1937, Serial No. 70,809
Term of patent 14 years



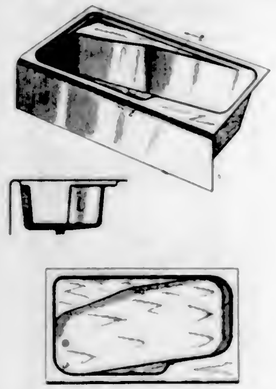
The ornamental design for a combined umbrella and support, as shown and described.

107,327
DESIGN FOR A PNEUMATIC TIRE
Sheldon P. Thacher, Grosse Pointe Park, Mich., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application August 24, 1937, Serial No. 71,297
Term of patent 14 years



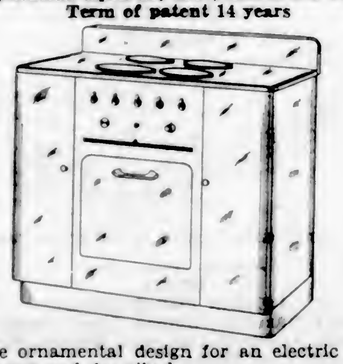
The ornamental design for a pneumatic tire, as shown.

107,328
DESIGN FOR A COMBINED CURTAIN ROD AND SHADE ROLLER BRACKET
Henry W. Ulrich, Elizabeth, N. J.
Application June 4, 1937, Serial No. 69,673
Term of patent 14 years



The ornamental design for a combined curtain rod and shade roller bracket as shown.

107,329
DESIGN FOR A PIANO
William Zaiser, Rockville Centre, N. Y., assignor to The Rudolph Wurlitzer Company, De Kalb, Ill., a corporation of Ohio
Application September 20, 1937, Serial No. 71,686
Term of patent 3½ years

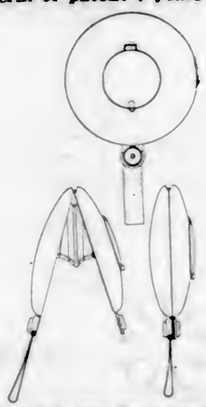


The ornamental design for a piano substantially as shown and described.

107,330
DESIGN FOR A BATHTUB
Roy H. Zinkil, Oak Park, Ill., assignor to Crane Co., Chicago, Ill., a corporation of Illinois
Application May 3, 1937, Serial No. 69,130
Term of patent 14 years

The ornamental design for a bathtub, substantially as shown.

107,331
DESIGN FOR AN ELECTRIC RANGE
Oscar M. Anderson, New Britain, Conn., assignor to Landers, Frary & Clark, New Britain, Conn., a corporation of Connecticut
Application April 26, 1937, Serial No. 68,978
Term of patent 14 years

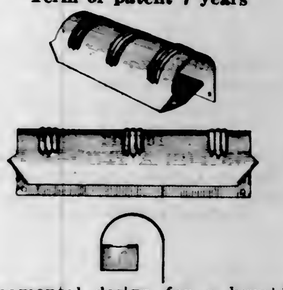


The ornamental design for an electric range, as shown and described.

107,332
DESIGN FOR AN EYECUP
Benjamin F. Conner, West Hartford, Conn., assignor to Colt's Patent Fire Arms Manufacturing Company, Hartford, Conn., a corporation of Connecticut
Application February 5, 1937, Serial No. 67,477
Term of patent 14 years

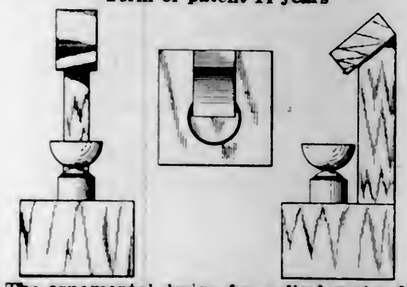
The ornamental design for an eyecup as shown and described.

107,333
DESIGN FOR A COMBINED LADY'S HANDBAG AND VANITY CASE
Josefine Glerden, Koln-Nippes, Germany
Application December 9, 1936, Serial No. 66,411
In Germany May 25, 1936
Term of patent 7 years



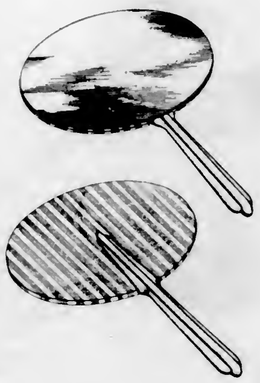
The ornamental design for a combined lady's handbag and vanity case substantially as shown and described.

107,334
DESIGN FOR A DIRECTIONAL SIGNAL LAMP FOR VEHICLES
Abraham Hollins and Jesse Hollins, Brooklyn, N. Y.
Application April 28, 1937, Serial No. 69,022
Term of patent 14 years



The ornamental design for a directional signal lamp for vehicles, as shown.

107,335
DESIGN FOR A HUMIDIFIER
Edward H. Horst, Clinton, Iowa, assignor to Patent Novelty Company, Fulton, Ill., a corporation of Illinois
Application October 13, 1937, Serial No. 72,142
Term of patent 7 years

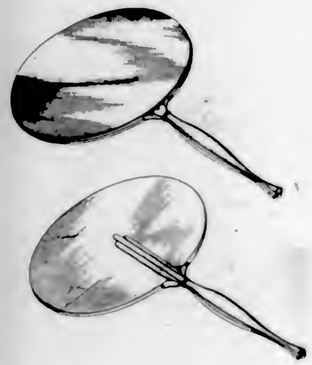


The ornamental design for a humidifier, as shown.

107,336
DESIGN FOR A DISPLAY STAND
John A. Kern, Chicago, Ill., assignor to The W. J. McCahan Sugar Refining & Molasses Co., Philadelphia, Pa., a corporation of Delaware
Application September 13, 1937, Serial No. 71,588
Term of patent 14 years

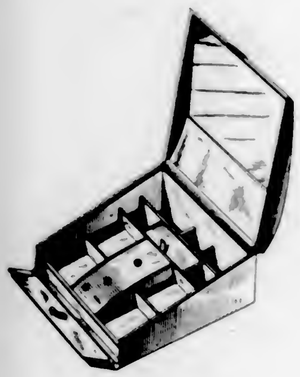
The ornamental design for a display stand, as shown.

107,337
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 6, 1937, Serial No. 69,209
Term of patent 14 years



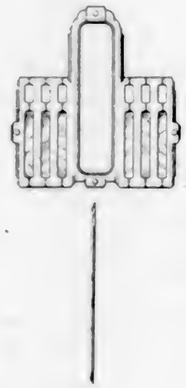
The ornamental design for a hand vanity mirror as shown and described.

107,338
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 7, 1937, Serial No. 69,224
Term of patent 3½ years



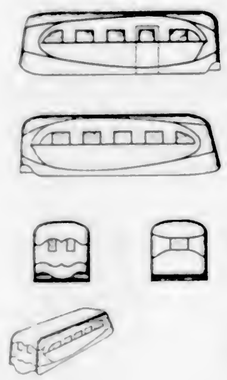
The ornamental design for a hand vanity mirror as shown and described.

107,339
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 8, 1937, Serial No. 69,248
Term of patent 3½ years



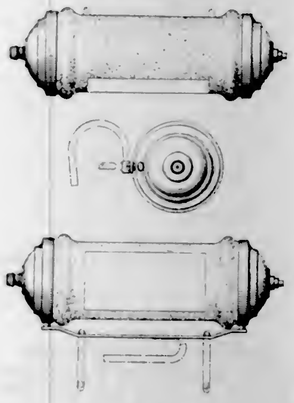
The ornamental design for a hand vanity mirror as shown and described.

107,340
DESIGN FOR A TOILET ACCESSORIES CONTAINER
Eugene J. Lux, New York, N. Y., assignor to Harriet Hubbard Ayer, Inc., New York, N. Y., a corporation of New York
Application August 14, 1937, Serial No. 71,079
Term of patent 3½ years



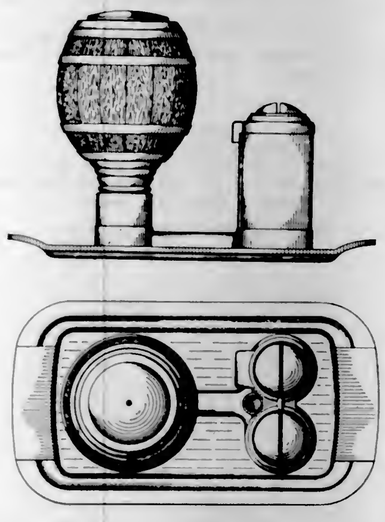
The ornamental design for a toilet accessories container as shown and described.

107,341
DESIGN FOR AN ESCUTCHEON PLATE FOR RADIO RECEIVERS
Richard C. Marholz, Chicago, Ill., assignor to Belmont Radio Corporation, Chicago, Ill., a corporation of Illinois
Application October 7, 1937, Serial No. 72,050
Term of patent 7 years



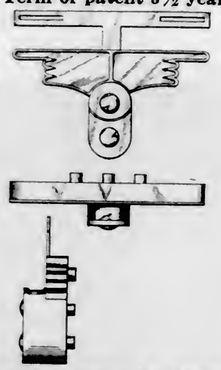
The ornamental design for an escutcheon plate for radio receivers as shown.

107,342
DESIGN FOR A VEHICLE BODY
Willard J. Miller, Detroit, Mich.
Application June 4, 1937, Serial No. 69,670
Term of patent 3½ years



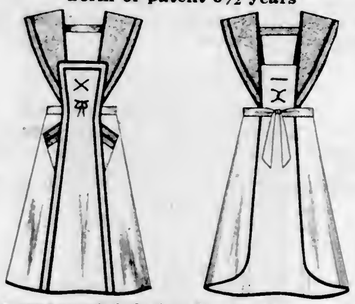
The ornamental design for a vehicle body, as shown.

107,343
DESIGN FOR A LAMP
Victor Nemeroff, Chicago, Ill., assignor to Electro Manufacturing Co., Chicago, Ill., a corporation of Illinois
Application October 2, 1937, Serial No. 71,927
Term of patent 7 years



The ornamental design for a lamp as shown and described.

107,344
DESIGN FOR AN ELECTRICAL HUMIDIFYING DEVICE
Elmer A. Reid, Morrisville, Pa.
Application October 8, 1937, Serial No. 72,083
Term of patent 7 years



The ornamental design for an electrical humidifying device, substantially as shown and described.

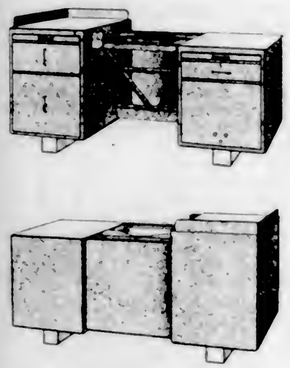
107,345
DESIGN FOR AN AUTOMOBILE DIRECTION SIGNAL
William M. Wicker, Sr., Carlyle, Ill.
Application May 1, 1937, Serial No. 69,119
Term of patent 3½ years

The ornamental design for an automobile direction signal, as shown.

107,346
DESIGN FOR AN APRON
Vitalis Alcouloumre, New York, N. Y.
Application November 8, 1937, Serial No. 72,680
Term of patent 3½ years

The ornamental design for an apron, substantially as shown.

107,347
DESIGN FOR A DRESS
Abner C. Barnhart, New York, N. Y.
Application October 20, 1937, Serial No. 72,321
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

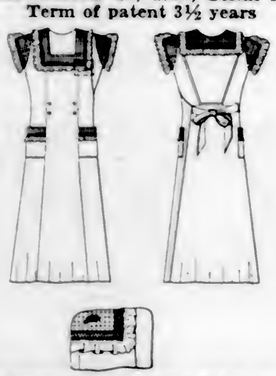
107,348
DESIGN FOR A TEXTILE FABRIC
John W. H. Brooks, Philadelphia, Pa.
Application November 13, 1937, Serial No. 72,829
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

107,349
DESIGN FOR A DESK
James R. Clark, Rochester, N. Y., assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Application May 24, 1937, Serial No. 69,530
Term of patent 14 years

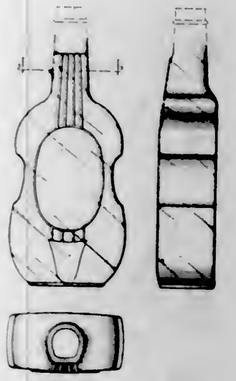
The ornamental design for a desk, as shown and described.

107,350
DESIGN FOR A DIRECTIONAL SIGNAL LAMP
Edward T. Condon, New York, N. Y.
Application April 6, 1937, Serial No. 68,577
Term of patent 7 years



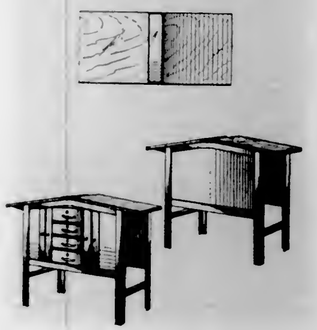
The ornamental design for a directional signal lamp, as shown.

107,351
DESIGN FOR A BUTTON
Fred H. Fisher, Syracuse, N. Y., assignor to Morris W. Haft & Brothers, Inc., New York, N. Y., a corporation of New York
Application March 23, 1937, Serial No. 68,358
Term of patent 3½ years



The ornamental design for a button, substantially as shown.

107,352
DESIGN FOR A DRESS
Samuel J. Goldfarb, New York, N. Y.
Application October 27, 1937, Serial No. 72,443
Term of patent 3½ years



The ornamental design for a dress, as shown.

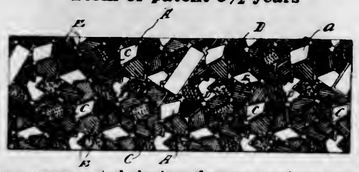
107,353
DESIGN FOR A BOTTLE
Harry D. Henshel, New York, N. Y., assignor to Bardstown Distillery, Inc., Bardstown, Ky., a corporation of Delaware
Application October 19, 1937, Serial No. 72,300
Term of patent 14 years

The ornamental design for a bottle as shown.

107,354
DESIGN FOR A DRAWING TABLE
Ubert C. Holland, New Brunswick, N. J., assignor to Endowment Foundation, New Brunswick, N. J., a corporation of New Jersey
Application September 30, 1937, Serial No. 71,885
Term of patent 14 years

The ornamental design for a drawing table, as shown.

107,355
DESIGN FOR A TEXTILE FABRIC FOR UPHOLSTERY
Henry P. Koch, Philadelphia, Pa., assignor to Northampton Textile Company, Mount Holly, N. J., a corporation of New Jersey
Application November 2, 1937, Serial No. 72,594
Term of patent 3½ years

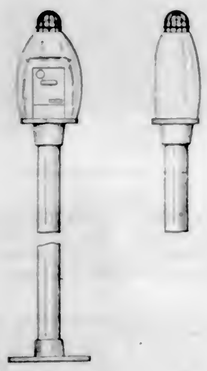


The ornamental design for a textile fabric for upholstery, as shown and described.

107,356
DESIGN FOR A WOVEN TEXTILE FABRIC
Joseph George Levy, New York, N. Y.
Application October 30, 1937, Serial No. 72,523
Term of patent 3½ years

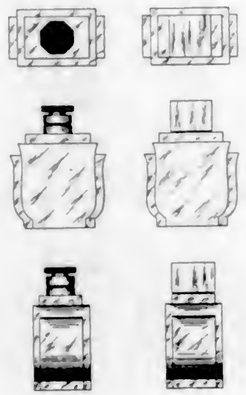
The ornamental design for a woven textile fabric, substantially as shown.

107,357
DESIGN FOR WRAPPING PAPER
Arthur Lewin, New York, N. Y.
Application January 16, 1936, Serial No. 60,623
Term of patent 3½ years



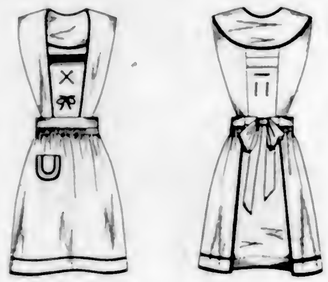
The ornamental design for wrapping paper, as shown and described.

107,358
DESIGN FOR A COMBINED BICYCLE GUARD AND LAMP
George S. Lewis, Oak Park, Ill., assignor to Battery Patents Corporation, Chicago, Ill., a corporation of Illinois
Application December 28, 1934, Serial No. 54,623
Term of patent 14 years



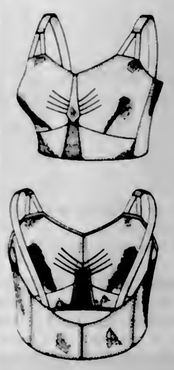
The ornamental design for a combined bicycle guard and lamp, substantially as shown.

107,359
DESIGN FOR A PARKING METER
Charles H. Martin, Springfield, Mass.
Application September 23, 1937, Serial No. 71,752
Term of patent 3½ years



The ornamental design for a parking meter, as shown.

107,360
DESIGN FOR A BOTTLE
Frank McIntosh, New York, N. Y., assignor to Lentheric Incorporated, New York, N. Y., a corporation of New York
Application November 2, 1937, Serial No. 72,592
Term of patent 14 years



The ornamental design for a bottle substantially as shown.

107,361
DESIGN FOR AN APRON
Maurice Mitrani, New York, N. Y.
Application November 8, 1937, Serial No. 72,684
Term of patent 3½ years

The ornamental design for an apron, substantially as shown.

107,362
DESIGN FOR A BRASSIÈRE
William Rosenthal, New York, N. Y., assignor to Maiden Form Brassiere Company, Inc., New York, N. Y., a corporation of New York
Application May 12, 1937, Serial No. 69,317
Term of patent 14 years

The ornamental design for a brassière, as shown.

107,363
DESIGN FOR A TEXTILE FABRIC
Walter Ross, New York, N. Y.
Application November 13, 1937, Serial No. 72,839
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

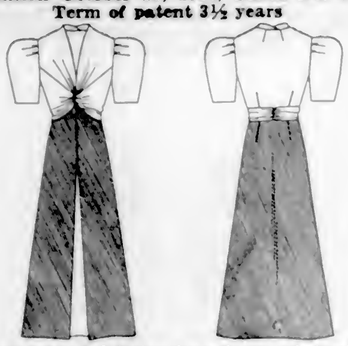
107,364
DESIGN FOR A TEXTILE FABRIC
Walter Ross, New York, N. Y.
Application November 13, 1937, Serial No. 72,840
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

107,365
DESIGN FOR A TEXTILE FABRIC
John W. Snowden, Philadelphia, Pa.
Application November 13, 1937, Serial No. 72,833
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown.

107,366
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application November 13, 1937, Serial No. 72,859
Term of patent 7 years

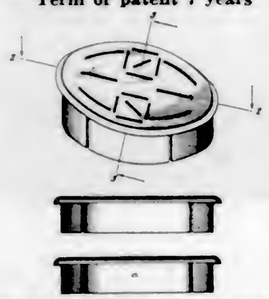


The ornamental design for a textile fabric, substantially as shown.

107,367
DESIGN FOR A TEXTILE FABRIC
Hans W. Wilde, North Bergen, N. J.
Application November 13, 1937, Serial No. 72,837
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

107,368
DESIGN FOR A DRESS
Philip Zahn, New York, N. Y.
Application October 20, 1937, Serial No. 72,333
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

107,369
DESIGN FOR A TEXTILE FABRIC
Joseph F. Berlinger, New York, N. Y.
Application November 13, 1937, Serial No. 72,838
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

107,370
DESIGN FOR A PIPE SPARK ARRESTER
Charley M. Bly, Cortez, Fla.
Application September 14, 1937, Serial No. 71,614
Term of patent 7 years

The ornamental design for a pipe spark arrester, as shown.

107,371
DESIGN FOR A FLASK
Sidney Brandeis, Chicago, Ill., assignor to Continental Glass Corporation, Chicago, Ill., a corporation of Illinois
Application November 1, 1937, Serial No. 72,549
Term of patent 3½ years

The ornamental design for a flask as shown.

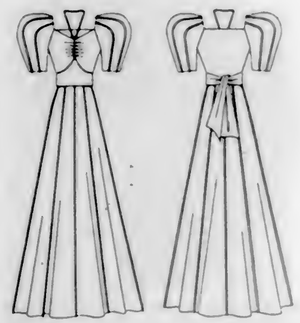
107,372
DESIGN FOR A LACE FOR A JACKET OR SIMILAR ARTICLE
Lawrence E. Hart and Herbert E. Lewy, New York, N. Y.
Application July 20, 1937, Serial No. 70,539
Term of patent 3½ years

The ornamental design for a lace for a jacket or similar article, substantially as shown and described.

107,373
DESIGN FOR A LACE FOR A CAPE OR SIMILAR ARTICLE
Lawrence E. Hart and Herbert E. Lewy, New York, N. Y.
Application July 20, 1937, Serial No. 70,540
Term of patent 3½ years

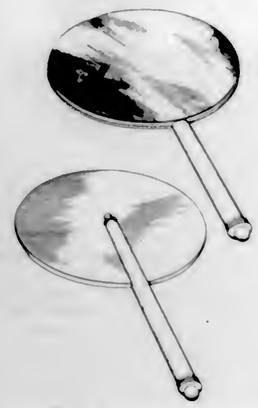
The ornamental design for a lace for a cape or similar article substantially as shown and described.

107,374
DESIGN FOR A LACE FOR A JACKET OR SIMILAR ARTICLE
Lawrence E. Hart and Herbert E. Lewy, New York, N. Y.
Application August 23, 1937, Serial No. 71,242
Term of patent 3½ years



The ornamental design for a lace for a jacket or similar article substantially as shown and described.

107,375
DESIGN FOR A COMBINATION BOTTLE AND CLOSURE CAP
Edward Horney, New York, N. Y.
Application July 17, 1937, Serial No. 70,489
Term of patent 3½ years

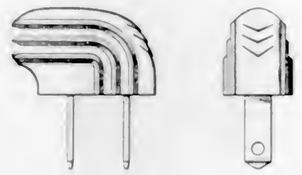


The ornamental design for a combination bottle and closure cap, as shown and described.

107,376
DESIGN FOR A DRESS
Margaret Michelson, New York, N. Y.
Application October 25, 1937, Serial No. 72,397
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

107,377
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 12, 1937, Serial No. 69,327
Term of patent 3½ years

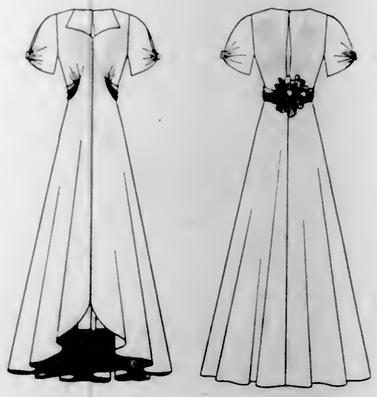


The ornamental design for a hand vanity mirror as shown and described.

107,378
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 10, 1937, Serial No. 69,253
Term of patent 3½ years

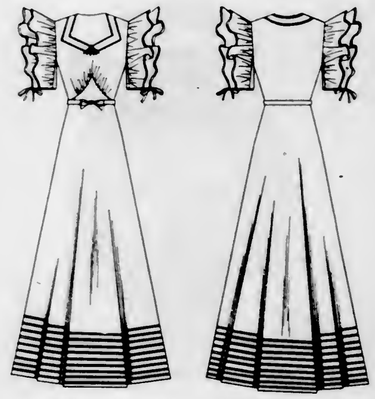
The ornamental design for a hand vanity mirror, as shown and described.

107,379
DESIGN FOR AN ELECTRICAL CONNECTING CAP
Raymond E. Patten and Gordon W. Florian, Bridgeport, Conn., assignors to General Electric Company, a corporation of New York
Application August 27, 1937, Serial No. 71,352
Term of patent 14 years



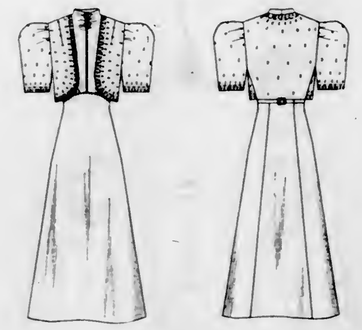
The ornamental design for an electrical connecting cap, as shown.

107,380
DESIGN FOR A DRESS
Sally Cicardo, New York, N. Y.
Application November 6, 1937, Serial No. 72,646
Term of patent 3½ years



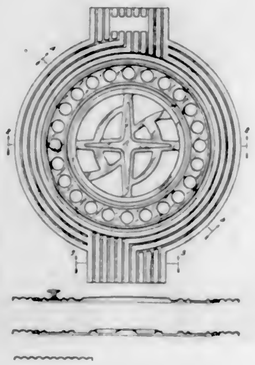
The ornamental design for a dress, substantially as shown.

107,381
DESIGN FOR A DRESS
Marie R. Berger, New York, N. Y.
Application November 9, 1937, Serial No. 72,725
Term of patent 3½ years



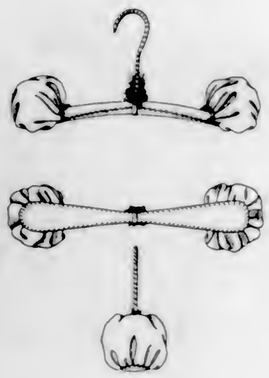
The ornamental design for a dress, substantially as shown.

107,382
DESIGN FOR A DRESS
Marie R. Berger, New York, N. Y.
Application November 9, 1937, Serial No. 72,726
Term of patent 3½ years



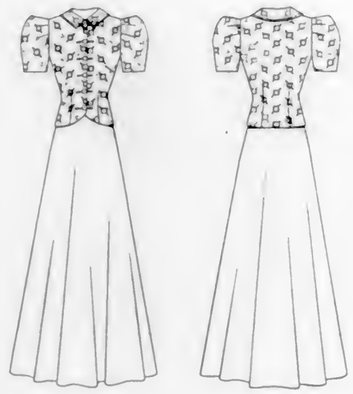
The ornamental design for a dress, substantially as shown.

107,383
DESIGN FOR A DRESS
Sally Cicardo, New York, N. Y.
Application November 6, 1937, Serial No. 72,647
Term of patent 3½ years



The ornamental design for a dress, substantially as shown, and described.

107,384
DESIGN FOR A DOOR FOR A HEATER CABINET OR THE LIKE
Mervin F. Cotes and Walter C. Schneider, Lansing, Mich., assignors to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan
Application May 10, 1937, Serial No. 69,279
Term of patent 3½ years



The ornamental design for a door for a heater cabinet or the like as shown.

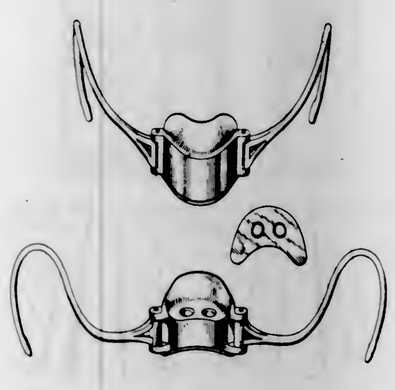
107,385
DESIGN FOR A COMBINED HANGER AND DEODORANT CONTAINER
Helen de Benque, New York, N. Y.
Application October 21, 1937, Serial No. 72,348
Term of patent 3½ years

The ornamental design for a combined hanger and deodorant container, substantially as shown.

107,386
DESIGN FOR A DRESS
Alice Engel, New York, N. Y.
Application November 11, 1937, Serial No. 72,803
Term of patent 3½ years

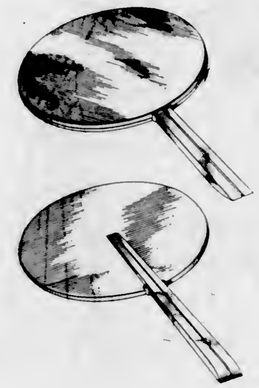
The ornamental design for a dress, substantially as shown and described.

107,387
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application November 8, 1937, Serial No. 72,674
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

107,388
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application November 10, 1937, Serial No. 72,738
Term of patent 3½ years

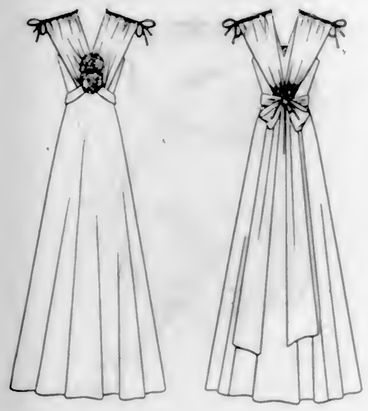


The ornamental design for a dress, substantially as shown.

107,389
DESIGN FOR A NOSE DEVICE OR SIMILAR ARTICLE
Benjamin Jacobson, New York, N. Y.
Application August 16, 1937, Serial No. 71,120
Term of patent 14 years

The ornamental design for a nose device or similar article, substantially as shown and described.

107,390
DESIGN FOR A HAND VANITY MIRROR
William La Hodny, Buffalo, N. Y.
Application May 11, 1937, Serial No. 69,292
Term of patent 3½ years



The ornamental design for a hand vanity mirror, as shown and described.

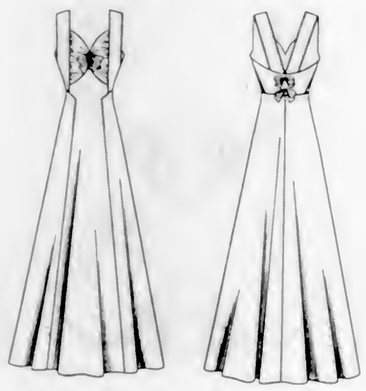
107,391
DESIGN FOR A DRESS
Ida Lampel, New York, N. Y.
Application November 6, 1937, Serial No. 72,648
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

107,392
DESIGN FOR A DRESS
Carolyn M. Santore, New York, N. Y.
Application November 6, 1937, Serial No. 72,649
Term of patent 3½ years

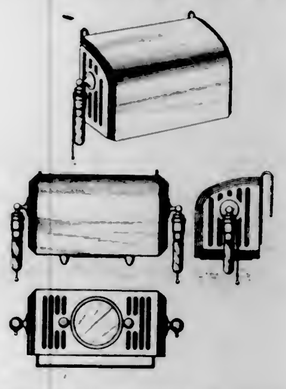
The ornamental design for a dress, substantially as shown.

107,393
DESIGN FOR A DRESS
Mollie Stone, New York, N. Y.
Application November 6, 1937, Serial No. 72,650
Term of patent 3½ years



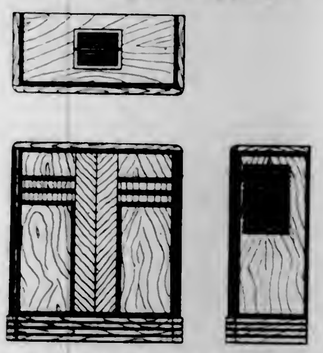
The ornamental design for a dress, substantially as shown.

107,394
DESIGN FOR A DRESS
Mollie Stone, New York, N. Y.
Application November 6, 1937, Serial No. 72,651
Term of patent 3½ years



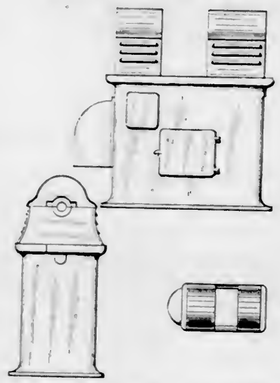
The ornamental design for a dress, substantially as shown.

107,395
DESIGN FOR A DRESS
Mollie Stone, New York, N. Y.
Application November 6, 1937, Serial No. 72,652
Term of patent 3½ years



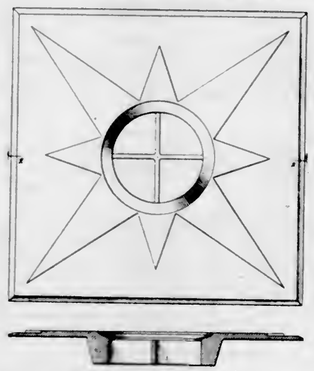
The ornamental design for a dress, substantially as shown.

107,396
DESIGN FOR A COMBINED RADIO RECEIVING SET AND BED LAMP
Leonard Tulauskas, Chicago, Ill., assignor to Climax Radio & Television Co., Chicago, Ill., a corporation of Illinois
Application September 22, 1937, Serial No. 71,714
Term of patent 7 years



The ornamental design for a combined radio receiving set and bed lamp, substantially as shown.

107,397
DESIGN FOR A SELF-CONTAINED AIR CONDITIONER CABINET
Herbert F. Weissinger, Detroit, Mich.
Application June 19, 1937, Serial No. 69,925
Term of patent 3½ years



The ornamental design for a self-contained air conditioner cabinet, as shown.

107,398
DESIGN FOR A CASING FOR METALWORKING MACHINE
Guy C. Worrell, Westfield, Mass.
Application October 19, 1937, Serial No. 72,318
Term of patent 14 years

The ornamental design for a casing for metalworking machine, as shown.

107,399
DESIGN FOR A COVER PLATE FOR AIR EXHAUSTING DEVICE
Harry Broadwin, Brooklyn, N. Y.
Application June 26, 1937, Serial No. 70,067
Term of patent 14 years

The ornamental design for a cover plate for air exhausting device substantially as shown and described.

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office

Vol. 485—No. 2 TUESDAY, DECEMBER 14, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed:

Pat. 1,896,276, G. Barsky and H. P. Wohnsiedler, Urea-acetaldehyde-formaldehyde resin and process of making same, decided October 5, 1937, claims 2 and 3.

Pat. 1,902,460, A. H. Mittag, Electric translating circuits, decided October 14, 1937, claim 11.

Pat. 1,984,060, Gerald Deakin and William Hatton, Telephone system, decided October 26, 1937, claims 4 and 7.

Suggestion for the Use of Coupons

The execution of orders for printed copies of U. S. patents, trade-marks, etc., will be considerably expedited if coupons are used. Such coupons may be purchased at the Patent Office in lots of 20 at $2.00 and 100 at $10.00.

Coupon orders do not have to be accompanied by letters of transmittal. They require nothing but the filling in of the patent number, the name of the inventor, the date of issue, and the name and address of the party desiring the service.

Adjudicated Patents

(D. C. N. Y.) Cramer patent, No. 1,800,719, for electrical condenser, claims 4, 11, 17, and 18 *Held* valid and infringed, and claim 20 *Held* invalid. *Condenser Development Corporation* v. *Montgomery Ward & Co.*, 20 F. Supp. 600.

(D. C. Minn.) Hawkinson patent, No. 1,917,261, for method of retreading tire casings, *Held* valid and infringed. *Paul E. Hawkinson Co.* v. *Skogmo-Gamble Inc.*, 20 F. Supp. 543.

(D. C. Minn.) Hawkinson patent, No. 1,917,262, for apparatus for retreading tire casings, claims 4, 5, 6, 9, and 10 *Held* valid and infringed. *Id.*

(D. C. N. Y.) Tompkins patent, No. 1,932,328, for condenser flame construction, claims 1, 4, and 5 *Held* invalid. *Condenser Development Corporation* v. *Montgomery Ward & Co.*, 20 F. Supp. 600.

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE BOYD ET AL.

No. 3,806. Decided June 7, 1937

[90 F.(2d) 130]

PATENTABILITY—MOTOR FUEL AND PROCESS OF MAKING SAME.

Claims for a motor fuel and claims for a process of making same *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

HATFIELD and GARRETT, *J. J.*, dissenting.

Mr. Hugh Kenelpp and *Mr. Thomas A. Boyd*, pro se for Boyd et al.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GRAHAM, *P. J.*:

Appellants filed an application in the United States Patent Office for a patent on certain alleged new and useful improvements in motor fuels and a process for making the same. Claims 5, 10, 13, 14, 15, and 17 to 22, inclusive, were rejected by the Examiner and, on appeal, this decision was affirmed by the Board of Appeals. These claims are now before us on appeal.

Claims 5, 10, 14, 18, and 19 are thought to be typical and are as follows:

5. The process of improving the detonation characteristics of an internal combustion engine fuel containing paraffin hydrocarbons which comprises determining the anti-knock value of isomers of the normal paraffin hydrocarbons and selectively increasing in said fuel the content of such isomers of the class having a relatively high anti-knock value.

10. A volatile hydrocarbon fuel for use in internal combustion engines consisting predominantly of isomers of the normal paraffin hydrocarbons of less than eight carbon atoms.

14. A fuel of high anti-knock value for internal combustion engines comprising a mixture of a fuel constituent having a relatively low anti-knock value and a fuel constituent selected from the group of volatile isomers of the normal paraffin hydrocarbons having an anti-knock value higher than that of 2,2,4-trimethyl pentane, said last-named constituent being present in greater proportion than in the motor fuel distillates of natural petroleum.

18. The process of preparing a fuel of relatively high anti-knock properties for use in internal combustion engines comprising preparing a mixture of saturated aliphatic hydrocarbons of the hexane and heptane groups the molecular structure of which is more highly centralized than in the normal members of the groups and adding such mixture to a fuel whose anti-knock properties are relatively low.

19. A fuel of improved anti-knock properties for use in internal combustion engines comprising, in combination with a fuel fraction of relatively low anti-knock properties, a material proportion of isomers of normal hexane and heptane having a more centralized molecular structure than 2 methyl hexane and 2 methyl heptane.

The references relied upon by both tribunals are: Snelling, 1,186,855, June 13, 1916; Henderson et al., 1,868,102, July 19, 1932; Cross "Handbook of Petroleum, etc."; Bulletin 25 of K. C. Testing Laboratory (1928), page 200 and page 374; Edgar "Measurement of Knock Characteristics of Gasoline * * * Fuel" Jour. of Ind. & Eng. Chem. January, 1927, pages 145 and 146; Gruse "Petroleum and Its Products", First Edition, pages 18, 19 and 232; Anderson et al. "Composition of Natural Gas", Jour. of Ind. and Eng Chem. March, 1924, pages 263–267.

Claim 5 was rejected on the Edgar article in "Journal of Industrial and Engineering Chemistry", on Henderson et al., Snelling, and on Gruse, and on the Anderson et al. article from the "Journal of Industrial and Engineering Chemistry", in view of Gruse. The remaining claims were rejected on the same references, although these claims differ in some respects from claim 5.

The alleged invention relates to the production of a motor fuel with high anti-knock or anti-detonating qualities. In preparing such fuel, it is proposed to use the aliphatic hydrocarbons. The applicants contend that they have discovered that the normal straight or open chain hydrocarbons have low anti-knock value in comparison with their isomers. Having found this to be true, the applicants concluded that they could produce motor fuel of high anti-knock qualities by adding to gasoline of low anti-knock qualities, sufficient isomers to bring the motor fuel to the point where its anti-knock value would be high. The blending was to be made as the result of careful tests. The underlying theory is that the more centralized the molecular structure of the motor fuel is, the less knocking or detonation there will be.

It is admitted that the art has been acquainted for some time with the fact that some of the petroleums have better anti-knock values, because of their closed chain molecular structure, such as the naphthenes and aromatics, but it is contended that the art has not heretofore known how the petroleums of low anti-knock value, such as paraffins, may be converted into motor fuel of high anti-knock value, by the methods disclosed by the appellants.

A view of the prior art, as cited by the tribunals below, discloses that this art is in its infancy. In fact, the disclosure of these appellants leaves much to be conjectured, although it is evident the composition and qualities of hydrocarbon molecules has had much useful study.

Some things, however, which are here claimed to be inventive, are clearly shown by the prior art. An article by Graham Edgar, in the cited number of "Industrial and Engineering Chemistry", discusses a blending process very like that in issue here. We quote, in part:

> In an investigation in this laboratory of certain pure hydrocarbons, it was discovered that chemically pure normal heptane (C_7H_{16}) has a pronounced tendency to knock greater than that of any commercial gasoline examined by this laboratory. It was also discovered that a certain octane (C_8H_{18}), first prepared in this laboratory, is a relatively non-knocking fuel. By mixing these two substances in varying proportions it is possible to duplicate the knock characteristics of any commercial gasoline.

If that fact were not theretofore known to the art, it seems quite obvious that after the Edgar publication those working in the art would know that at least one of the isomers of paraffins, isooctane, might be added to pure normal heptane with helpful effects as to its anti-knock value.

It seems that it would not be inventive to take similar isomers and find that similar results were obtained, especially when this was ascertained as

the result of a series of blends and observation of the results. *In re Rudolph Wietzel et al.* 17 C. C. P. A. (Patents) 1079, 39 F.(2d) 669, 400 O. G. 463.

In the patent to Henderson et al., in discussing Pennsylvania gasoline, it is said:

> It is the object of our invention to separate these fractions of low paraffine hydrocarbon content by subjecting gasoline or petroleum or petroleum fractions containing gasoline-like constituents to highly efficient fractional distillation and to blend the low paraffine content fractions thus obtained to produce a motor fuel of high antidetonating properties. * * *

Again, it cannot be said to be inventive to disclose that isomeric forms are found in paraffin gasoline. Snelling disclosed that many of the isomeric forms of pentane are present in gasoline, and we do not understand the applicants to contend that they were the first to discover that such isomers of branched chain formation existed in paraffins.

As the court views the matter, nothing inventive over the prior art is disclosed in this application. As a result of the researches of the applicants, an explanation has been made of certain natural reactions which have been known to the art to occur, but which were imperfectly understood. This does not, however, amount to invention. *In re Langdon*, 22 C. C. P. A. (Patents) 1245, 77 F.(2d) 920, 460 O. G. 733.

We find no error in the decision of the Board of Appeals, and it is affirmed.

Affirmed.

HATFIELD and GARRETT, *J. J.* dissent.

U. S. Court of Customs and Patent Appeals

JENKS *v.* KNIGHT

No. 3,845. Decided June 7, 1937

[F.(2d)]

1. INTERFERENCE—PRIORITY—QUESTION OF ESTOPPEL IS ANCILLARY.

   Question of estoppel due to failure of reissue applicant K. to copy interference claims from patent to J. within two years after issuance *Held* ancillary to question of priority and K's. motion to dismiss appeal denied. *Phelan* v. *Green*, 21 C. C. P. A. 1228, 71 F.(2d) 298, 448 O. G. 511, distinguished.

2. SAME — ESTOPPEL — APPLICANT FAILING TO COPY CLAIMS OF PATENT WITHIN TWO YEARS.

   "* * * Since the decision of *Chapman and Chapman* v. *Wintroath*, 252 U. S. 126, 272 O. G. 913, it has been the well-settled law that in an interference case where a party thereto copies the claims of an issued patent contending that he is the prior inventor who disclosed but failed to claim the invention, he should do so within two years of the issuance of the patent and if he waits longer he will, except under special circumstances, on account of laches, be estopped from claiming the invention."

3. SAME—APPEALS—REISSUE APPLICANT'S RIGHT TO A REISSUE NOT CONSIDERED ON APPEAL FROM AWARD OF PRIORITY.

   Question whether an interfering party who is a reissue applicant should be denied a reissue patent on ground the claims in interference are for the same invention as claims cancelled from his original application or on ground the claims in the interference are for the same invention as claims of his patent, is one for *ex parte* consideration with which the court is not concerned on appeal from an award of priority.

4. SAME—ESTOPPEL—PRIORITY.

   Where senior party K., a reissue applicant, filed his original application before the date of conception alleged by the junior party J. a patentee, but did not file his reissue application until approximately three years after the issuance of J's. patent, *Held* that estoppel against K. does not apply since his patent contains claims to substantially the same invention as that covered by the claims in interference and *Held* that priority was properly awarded to K.

APPEAL from the Patent Office. Affirmed.

Mr. O. H. Eschholz, Mr. W. R. Coley, Mr. G. M. Crawford, and *Mr. Raymond Jones* for Jenks.

Messrs. Saywell and Wesseler, Mr. William J. Wesseler, and *Mr. Albert H. Kirchner* for Knight.

BLAND, *J.*:

The appellant, Jenks, has here appealed from a decision of the Board of Appeals of the United States Patent Office in an interference proceeding which affirmed the decision of the Examiner of Interferences in awarding priority to the appellee, Knight, in five counts defining an invention relating to electrical control systems for rolling mills.

Count 1 is illustrative and reads:

> 1. In a control system for rolling mills provided with a plurality of rolls, in combination, a screw-down motor for adjusting the rolls, a limit switch, means for effecting the operation of said limit switch in accordance with the operation of the screw-down motor, means cooperative with the limit switch to effect the stopping of the screw-down motor in a plurality of predetermined positions, and means for variably controlling the distances between the respective positions.

The nature of the invention will be more fully explained in connection with the decision of one of the issues involved and hereinafter decided.

The counts 1, 2, 3, 4, and 5, were claims 1, 3, 4, 5, and 6 of the Jenks patent, copied by Knight in a reissue application. The earliest date alleged by the junior party Jenks for conception of invention defined by any of the counts is February 15, 1926. Knight's original application was filed February 11, 1925, over a year prior to Jenks' alleged conception date. Jenks was placed under an order to show cause why judgment on the record should not be rendered against him. In response to this order Jenks made a motion to dissolve on the ground that Knight was estopped to make the counts in his reissue application under the doctrine of *Chapman and Chapman* v. *Wintroath*, 252 U. S. 126, 272 O. G. 913, because he failed to copy the claims of the Jenks patent within two years from the issuance of said patent (not upon the ground that Knight could not make the counts).

Jenks' filing date was December 13, 1927. The two applications, although relating to the same subject matter, were copending in different divisions of the Patent Office. Jenks' Patent No. 1,764,312, inadvertently issued on June 17, 1930. Seventeen months thereafter, November 17, 1931, Knight's Patent No. 1,832,400, issued. Within the two year period from the issuance of the Knight patent, Knight filed a reissue application. The filing date of the reissue application, July 25, 1933, was more than two years after the issuance of Jenks' patent (approximately three years).

Appellee had constructive notice of the issuance of Jenks' patent for a period of approximately three years before he filed his application for reissue, and it is conceded in the record that he had actual notice of the issuance of Jenks' patent seventeen months before he made any effort to copy the claims.

Jenks' motion to dissolve was not set for hearing because Knight, being unwilling to stand upon the record, desired to take testimony to show special circumstances excusing the delay in filing his reissue application. Only Knight took testimony.

The main question decided by the Examiner of Interferences and by the Board, and the main question presented here is whether or not Knight, under the circumstances, is estopped from claiming the invention defined by the counts, which were claims in the Jenks patent, on account of Knight's delay in copying the claims for more than two years after the issuance of the Jenks patent.

The Board stated that Jenks, upon his appeal there, did not ask for priority but asked for a dissolution of the interference on account of Knight being estopped by reason of laches. Knight, the Board stated, orally asked that the appeal be dismissed on the ground that the questions raised were not ancillary to priority but were matters for *ex parte* consideration.

In this court, the position of the appellant is somewhat difficult to understand. He seems to press only one question, this being that Knight is estopped from claiming the invention by virtue of the facts aforesaid, that the Board erred in awarding priority to Knight, and that its decision should be reversed. In oral argument it is stated by appellant that he concedes he is not the first inventor and that in any event he could not have a patent, but that he knows of no reason why he should not be awarded priority as against Knight. He freely admits that Knight is the first inventor in fact, and states that his (Jenks') patent is invalid.

Appellee in this court, before the hearing of the case, filed a motion to dismiss appellant's appeal or to affirm the decision of the Board of Appeals on the ground that Jenks does not ask for an award of priority and that a decision of priority in favor of appellant could not properly be made here for the reason that Jenks' alleged earliest date of conception upon the record and according to Jenks' admissions is subsequent to Knight's filing date. This motion we took with the case at the time of oral argument without ruling thereon.

Whether the motion should be sustained or not seems to us to depend upon the answer to the question as to whether or not the estoppel question presented is ancillary to the question of priority. It is the position of Knight that under decisions of this and other courts, and under the circumstances of this case, the estoppel question presented is not ancillary. The Board of Appeals went into this question quite thoroughly and held, in substance, citing and discussing *Phelan* v. *Green*, 21 C. C. P. A. (Patents) 1228, 71 F.(2d) 298, 448 O. G. 511, that the question was not ancillary to priority, but in view of this court's holding in said case it did not dismiss the appeal but awarded priority to Knight.

[1] It is true that this court in *Phelan* v. *Green*, supra, held that since the estoppel there sought to be invoked did not operate in favor of the appellant, Phelan, it was not ancillary to the question of priority. Nevertheless, we there upon that record affirmed the decision of the Board in awarding priority to Green. The subject matter of the *Phelan* v. *Green* case, supra, which is of importance here is the holding that the question of estoppel there raised was not ancillary to the question of priority of invention. In that case there had been a three-party interference. One Mailey had been in the case and he disclosed the invention of the counts in his patent two years before appellee Green copied the claims. Mailey did not appeal from an award of priority against him. Phelan did and here urged that Green was estopped because of Mailey's early patent disclosure. This court held that while an estoppel might have existed against the appellee in favor of Mailey, there was none existing in favor of Phelan, and that for that reason the matter could not be ancillary to priority.

A different situation prevails in the case at bar. If there is any estoppel, it would operate in favor of Jenks and as far as this record shows, notwithstanding the admission of Jenks, if Knight was estopped from claiming the invention, Jenks might well be awarded priority. Under these circumstances, we hold that the question of estoppel presented is one ancillary to the question of priority and that we should review this part of the Board's decision. For the reasons stated, the motion to dismiss is denied.

[2] On the merits of the case, since the decision of *Chapman and Chapman* v. *Wintroath*, supra, it has been the well-settled law that in an interference case where a party thereto copies the claims of an issued patent contending that he is the prior inventor who disclosed but failed to claim the invention, he should do so within two years of the issuance of the patent and if he waits longer he will, except under special circumstances, on account of laches, be estopped from claiming the invention. The reason for the rule grew out of the analogy to a situation in which a two years public use was a bar to the granting of a second patent. Subsequent to the decision of that case, a number of other cases involving substantially the same question have been decided by the courts, most of which have been discussed in *Phelan* v. *Green*, supra, and need no extended discussion here. These cases show that there are exceptions to the rule.

The Board thought the facts in the present case did not warrant the application of the doctrine against Knight, although Knight had delayed nearly three years in copying the claims of the Jenks patent. The Board was persuaded that its decision was controlled for the most part by the rule laid down in *Chapman* v. *Beede*, 54 App. D. C. 209, 296 Fed. 956, 323 O. G. 230, which was decided subsequently to *Chapman and Chapman* v. *Wintroath*,

supra. In that case, Beede was the first inventor. He disclosed and claimed the invention. A patent was inadvertently issued to Chapman (who was the last to file) during the pendency of the Beede application. Beede copied the claims of the Chapman patent into his original application after more than two years had elapsed from the issuance of the Chapman patent. The decision of the Court of Appeals of the District of Columbia of this question is of such importance that we think it proper to quote extensively therefrom. The court said:

> It is contended, however, that the present case differs from other cases heretofore determined, in that the earlier application of Beede not only disclosed, but claimed, the subject-matter of the present interference, at a time anterior to the filing of the Chapman application. In other words, the contention is that, when the Chapman application was filed, there was pending in the Patent Office an application disclosing and claiming the subject-matter of the present claims. Assuming, for the moment, that the earlier application did disclose and claim the same invention covered by the claims of the issue, it is apparent that under the provisions of section 4904 R. S. (Comp. St. § 9449), an interference should have been declared by the Patent Office while the Chapman application was there pending, and that the failure of the Office in this respect prevented an orderly determination of the question of priority of invention between these two parties. The issuance of a patent to Chapman was an inadvertence, in no way chargeable to Beede. If an interference is not now sustainable, Beede's patent later will issue in due course, with claims commensurate with and anticipating the claims in the Chapman patent, and the courts will be deprived of the assistance of the Patent Office in the determination of the question of priority. It follows, therefore, that Beede's failure to copy these claims within two years from the issuance of the Chapman patent could result in no prejudice to the public, because, irrespective of this interference, his earlier application would have matured into a patent carrying the claims of the same scope. An application of the equitable principle or maxim that courts view as done what ought to have been done demonstrates that Beede, in the circumstances of this case, should not be deprived of an opportunity to have the question of priority determined. We therefore will proceed to determine whether his earlier application disclosed and claimed the subject-matter of the Chapman application.

It will be observed that there an exception was made to the two year rule. This was because of the fact that during all the time Chapman's application was pending, Beede was claiming the invention, that the issuance of the patent to Chapman was clearly an inadvertence, and that there was no delay on the part of Beede in claiming the invention since he had been claiming it from the beginning.

The Board in the instant case said:

> We agree with the Examiner. We call special attention to claims 3 and 5 of the Knight Patent No. 1,832,400 in which is set forth as a combination "a material modifying apparatus" and the intermittently operable electric motor with control mechanism for the motor to effect a certain change in the material modifying apparatus. The claims on appeal taken from the Jenks patent are more specific to a certain extent in being limited to a control system for rolling mills provided with a plurality of rolls but we note that Knight disclosed his control device as applied to rolling mills for positioning one of the rolls relative to the other. We have not been shown and do not consider the claims on appeal set forth a different invention from that expressed in the Knight patent claims as above noted. Certainly the Knight claims as to the mechanism in which the electric control is used are broader than the Jenks claims.
>
> The practice in this connection as laid down in *Chapman v. Beede*, 323 O. G. 270; 296 Fed. Rep. 956, is that a delay in copying the claims from a patent is excused where:
>
> "• • • the object of the two parties, as disclosed in their specifications, was the same, where substantially the same mechanism accomplishing substantially the same result was disclosed in their drawings, and where the invention claimed in B.'s application more than two years prior to C.'s filing date was substantially the same as and not patentably different from the invention covered by the counts of the issue."
>
> The Court in considering the situation as there presented, held that an interference should have been declared by the Patent Office while the patent applications were still pending and "that the failure of the Office in this respect prevented an orderly determination of the question of priority of invention between these two parties." That seems to be the situation here. The issue of the patent to Jenks was evidently an inadvertence and probably due to the fact that the Jenks application was handled by a different division of this Office than the Knight application. We are satisfied that Knight, under the *Chapman* v. *Beede* doctrine, is within his rights in copying the claims of the Jenks patent for the reasons stated.

The main difference between the two cases is that Beede at the time of copying the claims was not a patentee while Knight was. Assuming, for the purpose of the present discussion (the matter will be adverted to later), that Knight did claim broadly the invention of the counts during the prosecution of his application, which claims were presented and cancelled, and assuming further that such cancellation was prompted by the presentation by the Examiner of some of the claims which broadly cover the invention here involved and are now in the Knight patent, do such facts constitute a basis for the avoidance of the rule announced in *Chapman and Chapman* v. *Wintroath*.

The facts present a situation which differs in some respects from that of any case which we have examined. Appellee claims, and the Board held, that during the pendency of his application he, Knight, was at all times claiming the invention here in issue and that the claims of the Knight patent, especially claims 3 and 5, are for the same invention as that here involved. So, the distinction between the Beede case and this case is that in that case the estoppel was sought against an applicant who copied the claims in his original application without the necessity of the reissne of a patent, while in the instant case Knight claims the right to a reissue for the purpose of copying claims for an invention which he insists and the Board held is already covered by claims in his patent.

In addition to the contention that appellee was all the time claiming the invention here involved from long before the filing of appellant's application to the time of the issuance of the patent, the further contention is made that the record here shows satisfactory excuses why appellee should not be charged with laches in copying the claims. There is much testimony given concerning the appellee's alleged poverty. No such poverty is shown as would ordinarily excuse one where diligence or reasonably prompt action is required and we need not state or discuss all the facts here. The record, we think, shows that appellee was not in such poor financial condition as to warrant the conclusion that he could not have copied the claims within the two year period.

These facts, which appellee has proved with a view of offering an excuse for not sooner copying the claims, were evidently not regarded by the tribunals of the Patent Office as being of importance in the premises since they were not discussed by either. It was not necessary for Knight to present a state of facts for the purpose of showing that he did not purposely delay in order that he might extend his monopoly, since he already had a patent and the reissued one would bear the same date. Under these circumstances and in view of our conclusion we do not regard it as of importance here to further consider such facts as relate to his poverty, etc.

From the foregoing it would seem obvious that the question is a novel one. In applying the doctrine akin to equitable estoppel announced in *Mason* v. *Hepburn*, 13 App. D. C. 86, attention has frequently been called to the fact that the doctrine was one not favored by the courts inasmuch as it prevents one from being permitted to assert the truth. *Miller* v. *Hayman*, 18 C. C. P. A. (Patents) 848, 46 F.(2d) 188, 405 O. G. 549; *Severson* v. *Olson*, 20 C. C. P. A. (Patents) 946, 64 F.(2d) 694, 434 O. G. 253. This court has steadfastly refused to extend the doctrine. The estoppel sought to be invoked in the case at bar is claimed to be a true equitable estoppel based upon laches. Nevertheless, its application has the same objectionable result as does the application of the said doctrine akin to equitable estoppel. But, notwithstanding this fact, in cases like *Chapman and Chapman* v. *Wintroath*, supra, its application has met with the approval of the courts.

Now, in the case at bar we have assumed so far, for the purpose of discussing the application of the rule, that the record shows the facts as stated by the Board and the appellee. As hereinbefore pointed out, the facts of this case as stated by the Board are distinguishable from the facts in the Beede case, supra, in some particulars. We are, however, of the opinion that the principles involved here and there are substantially the same. We think the decision in the Beede case was sound. Under the circumstances shown there, it would have been a miscarriage of justice to have applied the doctrine of estoppel to Beede. For substantially the same reasons, assuming the holdings of the tribunals as to the facts in the case are correct, we are of the opinion that it would not be proper to hold that Knight is estopped from claiming the invention defined by the involved counts. The main consideration is that he did not delay in claiming the invention and therefore cannot be charged with laches. According to the findings of the tribunals, he not only had been claiming substantially the same invention during the time the Patent Office was considering the Jenks application, but broad claims for the same invention had already been awarded to him by the Patent Office in his issued patent.

It remains for us to determine whether or not the Patent Office tribunals are right in their conclusion that the record shows that during the period stated the appellee was claiming substantially the invention here involved and whether the Knight patent claims are for substantially the same invention.

Appellant frankly admits that he is not the first inventor, and concedes that appellee is such first inventor, and while he argues at considerable length that the Knight device and the Jenks device are wholly different and that the particular invention here involved is not the same invention defined by the claims of the Knight patent, he has not made it clear to us that the Examiner of Interferences and the Board were in error in their findings in this regard. Appellant points out that

> "at no time prior to the issuance of the Jenks patent on June 17, 1930, did the Knight application contain an allowed or an allowable claim,"

and that

> "All of these claims were rejected by the Examiner on various grounds, as on the art of record, as being unwarranted by the disclosure and as being inaccurate, obscure and indefinite."

It is also shown in the record that the rejection at times was based on the multiplicity of claims.

The subject matter of the claims involves a highly technical matter. Appellant argues that the invention involved here and the invention defined by the claims of the Knight patent differ in a number of particulars, one of the chief differences being that the Knight system is so arranged that it will function:

> • • • Only to effect successive progressive movements of the mill roll O in one direction in response to successive operations of the push button 42 and that both progressive and retrogressive movements of the mill roll cannot be effected in the same cycle of movements. Such results from the fact that the "dead" or stop points are all established and that it is necessary to operate the knife switch K to reverse the direction of operation of the screw-down motor.

Other contentions are made which need not be stated here.

The rule relating to concurring decisions of the Patent Office tribunals which involve highly technical matters is too familiar to require discussion here. See *Daley* v. *Trube*, *Daley* v. *Loftin*, 24 C. C. P. A. (Patents) —, 88 F.(2d) 308.

On the phase of the case last above described the Examiner said:

> A comparison of claims 1–5 of the Knight patent with the counts in issue shows very clearly that the two sets of claims are drawn to the same subject matter and invention. While the counts in issue are worded in somewhat broader terms than the claims of Knight it is evident that both the Jenks and Knight patents claim substantially the same invention. It is also evident from the file wrapper history of the original Knight application that Knight was claiming this invention prior to and throughout the period between the issuance of the Jenks patent on June 17, 1930 and the issuance of the Knight patent on November 17, 1931.

The Board said:

> • • • The claims on appeal taken from the Jenks patent are more specific to a certain extent in being limited to a control system for rolling mills provided with a plurality of rolls but we note that Knight disclosed his control device as applied to rolling mills for positioning one of the rolls relative to the other. We have not been shown and do not consider the claims on appeal set forth a different invention from that expressed in the Knight patent claims as above noted. Certainly the Knight claims as to the mechanism in which the electric control is used are broader than the Jenks claims.

We are not convinced that the tribunals were in error in holding that during the pendency of the Jenks application and afterwards appellee was claiming substantially the invention here involved and that some of the claims in Knight's patent are for substantially the same invention as is here involved.

Claim 3 of the Knight patent reads as follows:

> 3. A device of the character described having in combination, a material modifying apparatus, a reversible intermittently operable electric motor, a source of power therefor and means for closing the motor circuit to inaugurate operation, of means for determining the direction and extent of such operation as inaugurated by successive operations of said first-mentioned means, comprising a controller positively driven by said motor and provided with adjustable devices for temporarily maintaining the motor circuit closed and opening it at selected points of controller travel, and adjustable means for selecting forward or reverse motor connections for subse-

quent closure by said first-mentioned means and alternative means for manually controlling the starting, stopping or reversing of said motor.

We have examined the claims which were presented by Knight but which were rejected upon the grounds above stated, and other claims such as claim 3, supra, which were suggested by the Examiner and were accepted in lieu of the rejected claims. While the language of the involved counts and that of the cancelled and allowed claims differs somewhat, we are not convinced that the tribunals of the Patent Office were in error in holding that all of said claims were substantially for the same invention. It seems to us that the difference between them is more in the form of expression than in the inventive subject matter covered.

[3] It may be pointed out that although Knight has filed his reissue application within two years of his own issued patent, he would not be entitled to a reissue, the basis of which is inadvertence, if in fact he did claim the invention and cancelled the claims therefor, or if in fact his invention is already in the claims of his issued patent. The subject of the right of appellee to a reissue patent was referred to by the Board and it was its view, as it is ours, that that is a matter for *ex parte* consideration with which we are not now concerned.

[4] For the reasons stated by the Board, we are of the opinion that it should not be held that Knight is estopped by reason of alleged laches to claim the invention at bar and that under the circumstances the Board properly affirmed the decision of the Examiner of Interferences awarding priority of invention expressed in the counts to the party Knight, and its decision is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE MCCABE

No. 3,809. Decided June 7, 1937

[90 F.(2d) 111]

PATENTABILITY—REPULSION TYPE RELAY.

Claims for repulsion type relay *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. Langdon Moore and *Mr. James Atkins* for McCabe.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

The Primary Examiner of the United States Patent Office rejected all of appellant's claims for a patent relating to a repulsion type relay. Upon appeal to the Board of Appeals, the decision of the Examiner was affirmed and appellant has here appealed for a review of the Board's decision.

The Examiner in great detail describes the invention but sufficient description of it, we think, is found in the claims and in the decision of the Board. Concerning the nature of the invention the Board said:

> The invention relates to a repulsion type relay which utilizes the movement of a moving or floating coil of a movable transformer, such as is found in a constant current transformer to actuate the switch mechanism. The switch mechanism may be the ordinary open contact switch or the tilting mercury tube type of switch. The Examiner has fully described the invention in his statement.

The references relied upon are: Johnston, 713,887, November 18, 1902; Hewlett, 745,347, December 1, 1903; Coleman, 1,066,081, July 1, 1913; Bogle, 1,908,009, May 9, 1933; Ulrich, 1,940,032, December 19, 1933.

Claim 16 is regarded as illustrative and reads:

> 16. A repulsion relay including a transformer for alternating current having one coil stationary and one movable coil normally resting against the stationary coil when either or both coils are deenergized and when both coils are energized the movable coil is repelled from the stationary coil, and a tilting mercury switch actuated by the movement of the movable coil to make or break an electric circuit including a swinging arm and means to transmit movement of said coil to said arm.

The Examiner gave three grounds of rejection: First, that there would be no invention in using a mercury tube switch such as Ulrich or Bogle shows in a device like that of Coleman, Johnston, or Hewlett, the latter three patents showing as they do a movable coil similar to that of the applicant; second, upon Coleman, Johnston, or Hewlett alone; third, that there was no patentable distinction over the subject matter claimed in claims 1 and 2 of McCabe's Patent 1,973,925, of September 18, 1934.

The Board disapproved of the third ground of rejection and it will not be considered here.

We find it necessary to consider only the first ground of rejection above stated. On this ground of rejection the Board said:

> The claims have been rejected on either Coleman, Johnston or Hewlett in view of Ulrich or Bogle. In each one of the first three patents, there is shown a circuit breaker which includes a fixed coil and a movable coil for breaking the circuit. In Hewlett, the primary coil moves and in Johnston and Coleman, the secondary coil moves to operate the switch. In Hewlett, an arm 25 on which the primary coil is supported, actuates a lever 14 which releases a switch. In Johnston, a lever G is actuated by the secondary coil K to release the switch. It is evident that these arms could readily be employed to oscillate a tilting mercury switch. Evidently, any one skilled in the art could readily substitute such a switch in these patents if he so desired and have the arms actuate the mercury switch. It is our view that no invention is involved in such substitution. The Ulrich and Bogle patents show the use of tilting mercury switches. This combination of references meets claims 16 and 17.

Some of the claims are worded somewhat differently from claim 16, but as is pointed out by the Board each of these separately expressed limitations is shown in one or more of the references.

Concerning the issue presented in this court, the appellant in his brief states:

> *The question before the court*, therefore, resolves itself into *whether or not the Patent Office is justified in combining the five patents cited* to reject the appealed claims.

No contention is made that appellant's device does not work as the tribunals have stated or that the references do not show what the tribunals have pointed out. Appellant argues that it required invention to produce the combined structure which the claims call for and urges that in view of his showing of commercial success, the Patent Office had no right to "combine five references" for the purposes of rejecting the claims. Commercial success is shown, and admitted by the tribunals. That appellant has constructed a useful and novel device is unquestioned.

The five references were not combined in the sense that it required all of them to show the features called for by the claims. Each of the first three references shows one of the features and either of the last two references shows the other feature.

Appellant assigns as reason of appeal No. 6:

> 6. The Board of Appeals erred in considering claim 32 in connection with the patents cited as it was finally rejected only upon the patent to McCabe and the Board of Appeals did not affirm the rejection on this ground.

Concerning claim 32, the Board had this to say:

> Claims 32 and 33 are clearly unpatentable over the above patents particularly Hewlett considered with Ulrich or Bogle.

Appellant has not discussed this reason of appeal in his brief. The Solicitor for the Patent Office has mentioned this circumstance and has pointed out that under rule 139 of the Rules of Practice in the United States Patent Office, it is permissible for the Board of Appeals to apply a new ground of rejection, citing *In re Mulligan*, 23 C. C. P. A. (Patents) 1220, 83 F.(2d) 917, 473 O. G. 233. Rule 139 provides that under such circumstances the case is reopened and that the applicant might further prosecute his application before the Primary Examiner. The record does not show that such action was taken on the part of the applicant, and we assume that the above reason of appeal has been abandoned in this court.

All of appellant's arguments and contentions made in a very elaborate brief, which is replete with citation of authorities, have been carefully considered, but it has not been made clear to us that the Board's finding of want of invention was erroneous. We are of the opinion that the Board correctly held that appellant has done nothing more in producing the structure called for by the claims than a skilled electrical mechanic could do without the exercise of inventive genius. The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE PFLEGER AND MYERS

No. 3,828. Decided June 7, 1937

[90 F.(2d) 127]

1. PATENTABILITY—BEARING STRUCTURE.

Claims for a bearing structure *Held* unpatentable over the prior art.

2. SAME—AGGREGATION.

Claims including a bearing structure and a specific seating mechanism *Held* unpatentable as covering an aggregation of unrelated elements.

APPEAL from the Patent Office. Affirmed.

Mr. Eugene C. Taylor and *Mr. John Flam* for Pfleger et al.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GARRETT, *J.*:

The application for patent here involved relates to a bearing structure. All the claims, six in number, were rejected by the Examiner whose decision was affirmed by the Board of Appeals of the United States Patent Office. Appellants thereupon brought the decision of the latter to this court for review.

The claims are numbered 6, 8, 16, 28, 29, and 30. There is disclosed a structure containing a shaft, enclosed in a housing, the shaft being surrounded with a series of rolling elements or balls which constitute the bearing. The housing is provided on one side with an inlet passageway for the injection of the lubricant and an outlet passageway on the other side for its ejection. The inlet and outlet openings are closed by plugs. When it is desired to inject fresh lubricant, the plugs are removed and the grease forced into the inlet passageway by air pressure, or the like. This pressure forces the grease around the bearing "axially" and also forces the worn grease out through the outlet passageway. We quote claim 28 as illustrative of claims 6, 8, 28, and 30:

> 28. In a bearing structure for an electric motor shaft, a bearing, said bearing including a series of rolling elements, a housing surrounding said bearing, a body of plastic lubricant retained therein, said housing having an inlet and an outlet for passing lubricant into and out of said housing and around the bearings, means for normally retaining said lubricant around the bearings and in the housing, said inlet and outlet being accessible from outside the housing and so arranged with respect to the bearing that said inlet and outlet together with said bearing and said bearing housing form a continuous path whereby substantially all the lubricant initially retained in said housing may be expelled from said housing in response to a pressure exerted through said inlet.

In addition to the structure already described, there is disclosed a seal means structure which is embraced in claim 29 in combination with the bearing structure. This claim reads:

> 29. The structure as set forth in claim 28, in which said means for normally retaining said lubricant within said housing includes means surrounding the shaft for forming a multiple seal, and in which additional means are provided for the discharge of lubricant escaping past said multiple seal, said means including a receptive chamber for collecting said escaped lubricant and a passageway terminating exterior of said bearing housing for the discharge of said escaped lubricant.

The references cited are: Wallgren, 1,607,222, November 16, 1926; Brunner, 1,638,521, August 9, 1927; Buckwalter 1,748,972, March 4, 1930; Bock, 1,823,422, September 15, 1931.

It may be said that claim 30 is drawn to substantially the same structure as claims 6, 8, and 28, but defines the bearing housing as being provided with a pair of lubricant retaining chambers positioned at opposite sides of the bearing.

Claims 6, 8, 28, and 30 stand rejected on the patent to Bock in view of Brunner, or, alternatively, on Brunner in view of Bock.

The Bock patent is entitled "Rear Axle Wheel Bearing Lubrication.". It is designed for the use of a semi-solid lubricant or grease, and shows a housing with roller bearings journaled between races carried by the axle and the housing. It is provided with inlet and outlet passageways arranged at opposite sides of the shaft.

The patent to Brunner is entitled "Antifriction-Bearing Lubrication" and is one in which oil is used as the lubricant. It shows a rotatable shaft in a housing, the shaft and housing arranged to support bearing rings, or races, with balls between the rings. Above the shaft is a chamber for holding oil. From the bottom of the chamber a tube extends downwardly into the housing. The tube is

equipped with a filtering device shown in the form of a wick by means of which the lubricant is fed to a rotary part located between the inner rings of the bearing. In the lower portion of the housing there are outlet means.

It was the view of the tribunals of the Patent Office that there would be no invention in modifying the structure shown by Brunner so that there might be used therein the semi-solid lubricant, or grease, whose use is taught by Bock, or, conversely, that it would not require other than mechanical skill to modify the structure of Bock by arranging the inlet and outlet passageways in such manner that the grease would be forced axially around or through the bearing members.

On behalf of appellants it is argued as to the Brunner patent that it was designed for the use of oil and that patentee had no thought of filling a lubricant chamber with grease and confining the same in the chamber until it was worn out and then forcing it out by pressure used in connection with replenishing with fresh grease. It is conceded that the oil in Brunner's device moves axially of the shaft, but urged that he had no intention to take advantage of such movement for cleansing the bearing of the used lubricant, or for forcing anything else out of the bearing, "as dust or metal particles worn off from the bearing elements." We may here say, although the matter is not regarded by us as being important, that we do not find any teaching in appellants' application relating to the forcing of dust or metal particles from the housing. Like the claims, the specification is limited to cleaning the used lubricant from the bearings.

The argument respecting the Bock patent relates principally to the arrangement of the inlet and outlet passageways. It is said that in Bock's device these members are not arranged with reference to the shaft so that the lubricant is forced axially the shaft when fresh grease is introduced into the housing. The specification of appellant teaches that his inlet passageway is located in the top of his housing and his outlet passageway in the bottom thereof, but no one of the claims is so limited. So far as the claims are concerned, they are met by passageways on opposite sides the shaft, if those passageways, together with the bearing, form a continuous path whereby the used lubricant is expelled, and even this latter limitation, found in claim 28, supra, is not specific in all the claims.

[1] As we view the case, the issue as to claims 6, 8, 28, and 30 is reduced to the question of whether it involved invention to place the inlet and outlet passageways in such relationship that the result of ejecting the used grease in the manner described was obtained, and careful consideration of the structure of appellants in the light of the prior art cited, taken together with common knowledge of the nature of bearing lubricants, leads us to the same conclusion reached by the tribunals of the Patent Office.

[2] As to claim 29, the Examiner said:

> Claim 29 sets forth the structure of claim 28 and in addition includes a specific sealing means. The Examiner holds that this claim is unpatentable for the reason that it is drawn to an aggregation of unrelated elements. There is no necessary or special cooperation between the specific bearing assembly with its lubricating means and the specific sealing means set forth in this claim. They do not cooperate to produce a unitary result. No reason is seen why the specific seal set forth by this claim could not be used equally as well with entirely different forms of bearing assemblies, if desired. In fact, it is thought that applicant's own disclosure supports the Examiner's position in that Figs. 1 and 2 show that the same bearing assembly may be used with entirely different and distinct forms of seals. Seals have long since reached a separate and distinct status in the arts and are separately classified and searched. It is accordingly thought that applicant's seal is a separate and distinct invention.

In affirming the decision as to this claim, the Board said:

> • • • we agree with the Examiner that there is no patentable combination between a specific seal and a specific bearing lubricating means, where each performs its own function only.

The contentions on behalf of appellants with respect to this claim have been quite carefully studied in the light of the authorities cited, but the position taken by the tribunals of the Patent Office seems to us to be sound as a matter of law. No interrelationship of elements of the bearing structure with elements of the specific sealing structure described, which brings the joining of the two entities within the meaning of a true combination in the sense of the patent laws, is shown. Appellants have simply brought together two distinct and complete devices, each of which may function for its purpose independent of the other, and each of which, even when they are joined, performs only its particular independent function.

A somewhat unusual situation exists with reference to claim 16 which defines a seal for a shaft. The Examiner required division between it and the group consisting of claims 6, 8, 28, and 30. This requirement was submitted to the Examiner of Classification who approved it "provided claim 29 is not allowed." There was no appeal to the Board as to this requirement, but in the Examiner's statement following the appeal the claim was considered and held rejectable upon the patent to Wallgren in view of Buckwalter. The Examiner stated that this action was taken

> "In order that the answer may be complete in the event that claim 29 is subsequently held to be allowable."

The Board made no reference to claim 16 in its decision, and it seems to be conceded that a necessity for our considering it could arise only from an allowance by us of claim 29. Since, therefore, we do not regard claim 29 allowable, we need give no further attention to claim 16.

The decision of the Board of Appeals is affirmed. Affirmed.

U. S. Court of Customs and Patent Appeals

ELY & WALKER DRY GOODS COMPANY

v.

SEARS, ROEBUCK & COMPANY

No. 3,813. Decided June 7, 1937

[90 F.(2d) 257]

1. TRADE-MARKS—OPPOSITION—VALIDITY OF REGISTRATION BY OPPOSERS NOT IN ISSUE.

A registration of a mark is prima facie evidence of ownership and the validity of such a registration which is relied upon by the opposer may not be attacked in an opposition proceeding.

2. SAME—SAME—SIMILARITY OF MARKS "NEEDLE-THRIFT" AND "NEEDLEIZED".

The term "Needleized" as applied to cotton piece goods *Held* confusingly similar to the term "Needle-Thrift" as applied to the same goods and appellant *Held* not entitled to register the former mark in view of the prior registration by appellee of the latter.

APPEAL from the Patent Office. Affirmed.

Mr. William Keene Small for Ely & Walker Dry Goods Co.

Mr. Edward D. Jones for Sears, Roebuck & Co.

GARRETT, *J.*:

This is a trade-mark opposition proceeding in which appellee (hereinafter referred to as opposer) opposes the application of appellant for registration of the word "Needleized" as a trade-mark for cotton piece goods. It comes to us by appeal from the decision of the Commissioner of Patents affirming the decision of the Examiner of Interferences sustaining the opposition and denying the registration.

In its notice of opposition opposer plead its ownership, registration, and use of the word "Needle-Thrift" for "cotton piece goods—namely, muslin, cambric, long-cloth, and nainsook." This registration No. 149,234 bears date of December 6, 1921, with use alleged "since July 16, 1920." Appellant's application was filed April 23, 1934, with use alleged "since about April 1, 1933."

The goods of the respective parties are obviously identical. So, the ultimate question to be determined is whether the application of the marks "Needleized" and "Needle-Thrift" to identical merchandise would be likely to cause confusion or mistake in the mind of the public or to deceive purchasers. However, certain collateral or subsidiary issues are raised and argued by appellant to which we give attention.

The notice of opposition, which was sworn to, alleged ownership and continuous use by opposer of its mark "Needle-Thrift" to identify its cotton piece goods; also, it alleged the spending of "substantial sums to advertise its said trade-mark for said goods." In connection with its certificate of registration, the notice averred: "Said registration is still in full force and effect." It contained the usual allegation of belief that it would be damaged by the grant of appellant's application.

In its answer (not sworn to) appellant, among other things, stated:

> • • • Applicant admits that opposer obtained from the United States Patent Office on December 6, 1921, a certificate of registration No. 149,234 covering the term "Needle-Thrift" with respect to muslin, cambric, long cloth and nainsook cotton piece goods and that said registration is subsisting, but denies that opposer was entitled to obtain said registration and that the application therefor met the requirements of the Trade-Mark Act of February 20, 1905.

The answer alleged that opposer's use of its mark, "if used in any manner," was not as a trade-mark "but merely as an indication of grade or quality." Also, appellant cited numerous registrations to other parties which included the word "Needle" in combination with different prefixes and suffixes and, in some instances, with other words, such registrations apparently being for goods similar to the goods of the respective parties here involved. It was alleged that all the registrations so cited were obtained subsequent to the date of opposer's registration. Further, appellant cited a registration to it of a composite mark, which included as one element the word "Needleized", granted September 26, 1933. By way of "affirmative defense" appellant recited the difference in the marks, denied that "Needleized" and "Needle-Thrift" are confusingly similar "within the meaning of any clause or section of the Trade-Mark Act" and also denied that its proposed mark

> "is by it applied to merchandise of the same descriptive properties as such merchandise, if there be any, as may be sold by opposer under the notation 'Needle-Thrift'."

As has been already indicated, this latter denial is obviously futile, since the goods of the parties are virtually identical, and this particular issue requires no further attention. The answer does not contain any denial of, or reference to, opposer's allegation as to damage.

Neither party took testimony in the case, but prior to the expiration of the time set for completing opposer's testimony-in-chief (such time having been extended by stipulation of counsel), counsel for opposer gave notice to counsel for appellant (such notice purporting to be under Patent Office Rule 154 (*e*)) that opposer proposed to use "as evidence" certain described documents. One of those consisted of a copy of opposer's registration of "Needle-Thrift", No. 149,234. The other items consisted of advertising matter, many of them alleged to have appeared in different of opposer's copyrighted catalogues.

Following receipt of the notice appellant filed motion that opposer be required to show cause why the opposition should not be dismissed. In this motion, which is of record, we do not find any objection made to the introduction by opposer of the documents described in the notice, nor do we find where objection was elsewhere made. The objection in the motion goes not to their introduction, but to their sufficiency to support the allegations of opposer as to use of the trade-mark, "probable injury * * * confusion in trade or other allegations in the notice of opposition contained." The gravamen of appellant's motion was that opposer should be required to substantiate its allegations by "testimony," and that it had failed so to do.

The motion to show cause was granted, and opposer filed reply thereto.

Upon the record so presented, the Examiner of Interferences rendered the decision which the Commissioner of Patents affirmed. It is not discernable from the decisions that the "Notice under rule 154 (E)," to which appellant's counsel has devoted extensive attention before us, entered into the consideration of the case by either the Examiner of Interferences or the Commissioner. Neither decision makes any reference to it. Therefore, we are unable to see wherein any matter concerning it requires discussion or determination by us.

[1] Already it has been recited that, in its

answer, appellant, while denying that opposer owns the mark, admitted that opposer obtained the registration and that such registration is "subsisting." It is noted that appellant in the same paragraph of the answer also

"denies that opposer was entitled to obtain said registration and that the application therefor met the requirements of the Trade-Mark Act of February 20, 1905."

Upon what state of facts or theory of law this latter averment rests we are not informed. The denial of ownership is inconsistent with the admission of the obtaining and subsistence of the registration. Registration of a mark is prima facie evidence of its ownership. Sec. 16, Trade-Mark Act of 1905. The denial of the right of opposer to obtain the registration and the claim that opposer's application did not meet the requirements of the trade-mark registration act go to the question of the validity of opposer's mark. The validity of a registered mark may not be attacked in an opposition proceeding. In the case of *American Fruit Growers, Inc.*, v. *Michigan Fruit Growers, Inc.*, 17 C. C. P. A. (Patents) 906, 910, 38 F.(2d) 696, 393 O. G. 789, we said:

So far as we are aware, appellant was entitled to the registration of its mark for use on its products, * * * if it was inadvertently registered, those injured by such registration have a statutory remedy—application for cancellation.

Upon the question of use by opposer of its mark as a trade-mark, which counsel for appellant insists is placed in issue by denial of such use in the answer, it need only be said, first, that ownership implies use and, second, that under the rule announced by this court in *John Wood Manufacturing Co.* v. *Servel, Inc.*, 22 C. C. P. A. (Patents) 1370, 77 F.(2d) 946, 461 O. G. 948, one may oppose a registration upon showing merely a "grade-mark" or "trade-name" use when such use is analogous to a trade-mark use, and the answer of appellant in this case virtually admits a use of "Needle-Thrift" by opposer to indicate "grade or quality."

Counsel for appellant seems aggrieved because counsel for opposer failed, or was not required by the Examiner of Interferences, to call officials of appellee company, or other witnesses, to the end that he might cross-examine them, and argues that there was not a compliance with the statement issued to the respective parties by the Examiner of Interferences, saying that "the practice of United States equity courts will be followed in pleading and procedure."

The brief on behalf of appellant, after pointing out the matters denied in the answer, says:

Why has the opposer, the validity of its registration being thus challenged, taken no testimony and adduced no proof on that or any other issue raised by the denials and averments of applicant's answer? The explanation seems obvious. No such proof was available. Had witnesses been called in the attempt to make such proof, they would have been subjected to the test of cross-examination, but the opportunity to thus ascertain the truth of the matter has been denied applicant's counsel. Certainly it is not to be expected, under Federal equity practice, that applicant should go to the trouble of taking testimony when there has been an entire default in that respect by the complaining party, who carries the burden of proof, and we indulge the presumption that citations on this point are unnecessary to supplement the legal knowledge of the court.

The foregoing indicates that counsel for appellant overlooked the effect of the statutory provision making a registration prima facie evidence of ownership, and overlooked also the universally applied maxim, "Equity follows the law."

Upon the record and in view of the admission in appellant's answer, we do not think that the validity or the use of opposer's mark was so challenged as to require the taking of testimony by opposer upon those questions, and we know of no authority lodged in the Examiner of Interferences to require opposer to call witnesses for the purpose of giving counsel for an applicant the opportunity to cross-examine them.

As for the registration to other parties of marks containing the word "Needle" and that to appellant containing as a part thereof the word "Needleized", the brief on behalf of appellant makes the concession that

"under decisions of this court, the several registrations referred to are not conclusive upon the question of applicant's right to registration,"

but it is claimed that they

"should be viewed as establishing the fact that the opposer is not entitled to monopolize the prefix 'Needle' which is the only point of resemblance between its notation 'Needle-Thrift' and the notation 'Needleized' sought to be registered."

Also "laches and acquiescence" on the part of opposer is alleged, which it is claimed should estop opposer from opposing appellant's application.

Under numerous decisions of this court in which we followed the rule established by other courts these contentions must be overruled. *American Fruit Growers, Inc.*, v. *Michigan Fruit Growers, Inc.*, supra. *Skookum Packers Association* v. *Pacific Northwest Canning Co.*, 18 C. C. P. A. (Patents) 792, 45 F.(2d) 912, 403 O. G. 515.

From the record here presented, we think the case must be determined solely upon the question of the similarity of the marks. If they are so similar that confusion would likely result from their use, nothing which either party might do, or fail to do, by pleadings or by testimony, can alter that fundamental fact, and this constitutes a bar by the terms of the statute itself.

[2] Just what the words mean in the relation in which they are used as trade-marks is not clear to us. So far as the record is concerned, we do not find any suggestion that they are merely descriptive of the character or quality of the goods. Were such the case, both marks should be barred from registration. So far as we can discern, the words have no particular meaning, as used, and, for the purposes of this case, we accept them as constituting arbitrary marks. So viewing them, we concur with the tribunals of the Patent Office in the holding that there is such a similarity between them that confusion would be likely from their use upon goods of the same descriptive properties.

Accordingly, the decision of the Commissioner of Patents is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

LASKER AND RUSSELL *v.* KUROWSKI AND SMITH

No. 3,856. Decided June 7, 1937

[90 F.(2d) 132]

1. INTERFERENCE—PRIORITY—CONCURRING DECISIONS.
"There was agreement by the tribunals of the Patent Office upon every material issue of fact presented. Under such circumstances, the controversy being only as to facts, it is well understood that a heavy burden rests upon the appealing parties."

2. SAME—SAME—TESTIMONY OF JOINT APPLICANT.
"It is recognized that, being joint inventors, the oral testimony of one may not, under the rule, be accepted as sufficient, standing alone, to corroborate the oral testimony of the other and thereby establish conception, but that there must be other corroborative evidence."

3. SAME—SAME.
Evidence reviewed and *Held* insufficient to establish a conception by appellants of the invention in issue prior to the filing date of appellees.

APPEAL from the Patent Office. Affirmed.

Mr. Samuel E. Darby, Jr., and *Mr. Floyd H. Crews* for Lasker et al.

Mr. Burnham C. Stickney for Kurowski et al.

GARRETT, *J.:*

There is here brought to us for review the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Examiner of Interferences, in a patent interference proceeding, awarding priority to appellees. The only question involved is priority to be determined from the evidence. Ten counts, numbered 1 to 10, inclusive, appear in the interference, but since the matter turns upon a single element, as combined with others, there is no occasion for analyzing the counts separately. Count 2 seems fairly illustrative of the subject matter. It reads:

2. The combination with a recording machine comprising a carriage and a key board; of punches, an electromagnet for each punch for controlling it for operation, a circuit closer for each key to energize a magnet when its corresponding key is depressed, a common circuit closer for all of said magnets, and a bar movable with said carriage for opening and closing said common circuit closer for predetermined positions of the carriage.

The interference was declared between a patent, No. 1,790,479, issued to appellants January 27, 1931, on an application filed September 17, 1926, and an application of appellees, Serial No. 645,896, filed December 6, 1932, for the reissue of Patent No. 1,745,172, issued to them January 28, 1930, on an application filed January 2, 1926. The counts correspond to claims in the patent of appellants, copied by appellees into their reissue application.

As will be observed from count 2, supra, the invention is a combination of a typewriting machine and a card punching device, the two being connected by means whereby the punching operation is automatically controlled as the typewriter keys are operated and the typewriter carriage moves. This means consists, as expressed in the quoted count, of

"a bar movable with said [typewriter] carriage for opening and closing said common circuit closer for predetermined positions of the carriage."

The complete device is designed for producing perforated record cards (used for making groupings, analyses, tabulations, etc.) simultaneously with the typing of the record upon a work sheet in the typewriter. To this end the typewriter keys are electrically connected with the proper parts of the punching device. Frequently, it is not desired to transfer to the record card some portions of the matter being typed upon the work sheet; consequently, it is desired to break the electrical connection at the point where the typewriter reaches such portions, and restore the connection when matter is reached which it is desired to record upon the cards. It appears that in the prior art the breaking of the electrical connection was accomplished by the operator manually through either a button switch or a foot switch. The present invention is designed to provide for breaking the connection automatically. This, it is said, is accomplished by cutting away portions of the surfaces of the bar, and providing a series of cams on the typewriter carriage to control the electric switch. As the bar travels with the typewriter carriage, when the cam encounters the portion of the surface not cut away, the circuit is closed and punching of the card ceases. When it reaches a cut away portion the connection is automatically restored and the punching operation begins.

It is not questioned that appellees disclosed the invention in the application for the original patent filed January 2, 1926. The Examiner of Interferences awarded them conception "prior to the end of October, 1925," and held that they showed due diligence between that time and the filing date of their application. This, the Board affirmed.

As to the date or dates awarded appellants, counsel appearing before us on behalf of the respective parties are in sharp disagreement. Counsel for appellants seem to have the theory that they received an affirmative award of October 31, 1925, for both conception and reduction to practice. Counsel for appellees maintains that there was no affirmative award to appellants of any date for either conception or reduction to practice. From our study of the respective decisions below, it is our conclusion that the contention of counsel for appellees is correct. The purport of the decision of the Examiner of Interferences, later approved by the Board, is that the earliest date which could be awarded appellants, even when given the benefit of certain assumptions claimed to be justified by the evidence (but not specifically passed upon by the Examiner of Interferences), was October 31, 1925. The language of the Board is somewhat more specific, but even it does not, in our opinion, constitute an affirmative award to appellants of any date. We think it obvious that in view of their conclusions as to the conception date and diligence of appellees, it was felt by the tribunals that an award of specific dates to appellants was not required.

There is no contention before us that there was lack of diligence on the part of appellees, but it is contended that December 1, 1925, is the earliest date on which conception by the latter can be considered to have been proved.

In the brief on behalf of appellants it is contended that they proved conception "on December 10, 1924," and "again during the month of May,

1925," and "again in September, 1925." Further, it is contended that they proved reduction to practice "during September, 1925," and "again prior to December 1, 1925," and "again prior to March 12, 1926." Diligence is alleged in the brief to have been proved from the first date of conception claimed, December 10, 1924, "through all their reductions to practice." In the preliminary statement reduction to practice was claimed on or about November 21, 1924.

[1, 2] The record in the case is voluminous, much oral testimony having been taken, and many documentary exhibits having been introduced on behalf of both appellants and appellees. The Examiner of Interferences reviewed the evidence in great detail. The Board's decision was less elaborate but it covers every pertinent question succinctly. There was agreement by the tribunals of the Patent Office upon every material issue of fact presented. Under such circumstances, the controversy being only as to facts, it is well understood that a heavy burden rests upon the appealing parties. This court will not reverse except it be convinced that the concurring decisions were clearly wrong.

We first consider the contention with regard to the date of appellees' conception. In their preliminary statement they claimed August 28, 1925. Subsequently, they sought, unsuccessfully, to amend the statement and claim conception as of June 10, 1925. Both Smith and Kurowski testified at length. To review their evidence in detail is unnecessary. It is recognized that, being joint inventors, the oral testimony of one may not, under the rule, be accepted as sufficient, standing alone, to corroborate the oral testimony of the other and thereby establish conception, but that there must be other corroborative evidence.

The patent to appellees, reissue of which is being sought, is quite an elaborate one containing, as issued, 92 claims. The written specification covers almost seven printed pages and there are five pages of drawings embracing 12 figures. We think it is clear that in the spring or early summer of 1925, possibly in 1924, the broad idea of providing a connection between a typewriting machine and a card punching machine in which there would be an automatic control of the electrical switch was in the minds of appellees, and there appears in the record a letter addressed by Smith to Kurowski under date of August 28, 1925, a copy of which at the same time was sent to the patent attorney having in charge the preparation of the application. In this letter Smith, after reciting the disadvantages incident to the prior art whereby control was exercised manually by the operator of the typewriter through the medium of a foot pedal, said:

> I would therefore suggest that you attach to the front of the typewriter directly in line with the type bar guide at the printing point, a connection; and that you have a second connection point attached to the traveling typewriter carriage. These connecting points can be adjustable, and be placed anywhere on the carriage. The idea is that when the carriage with the disconnect connection reaches the connection attached to the front of the typewriter, that contact will be made or broken as the case may be, and the punch made inoperative; that a further movement of the typewriter carriage will make the punch operative. In this way, the disconnecting of the punch is made automatic.
>
> There are many ways in which this could undoubtedly be worked out, and I would suggest that you give this some thought and include this in your sketches to Mr. Stickney [the patent attorney of the company with which appellees are associated] so that he can protect the company's interests.

Kurowski testifying as to this letter stated, in substance, that previously there had been verbal discussions between them upon this specific subject; that he interpreted the letter as being a memorandum to verify such verbal discussions; that he had his layout completed before its receipt, and that the feature at issue had been incorporated in a drawing or drawings sent to the patent attorney September 25, 1925.

A draftsman of the attorney's office testified at length concerning the showing of the drawings and blue prints which had been supplied by appellees, including the dates thereof, and concerning the letter of August 28, 1925, from Smith to Kurowski. The details of this testimony are given in the decision of the Examiner of Interferences and are repeated in substance in the decision of the Board. It is unnecessary to repeat them here. We agree that it is clear that the draftsman understood the invention at issue from the documents so furnished and that conception on the part of appellees is shown prior to the last of October, 1925.

Turning now to the evidence on behalf of appellants, it is to be borne in mind that they also claim joint invention, and that the same rule as to corroboration applies to them as that applicable to appellees. The Examiner of Interferences said:

> The case for Lasker and Russell rests largely upon the recollection of witnesses, testifying on and after December 14, 1933, concerning events alleged to have happened in the years 1924 and 1925. In the case of *American Bell Telephone Company* v. *The People's Telephone Company et al.*, 29 O. G. 1029; 1884 C. D. 475, one hundred witnesses, more or less, testified that on one or more occasions, which took place from five to ten years before, they thought they saw this or that device used as a talking machine; yet despite this cloud of witnesses for the defense, the great body of which were undoubtedly honest, a decree was ordered for the complainant, which was affirmed on appeal (*The Telephone Cases*, 43 O. G. 377; 1888 C. D. 321). Such testimony must always be carefully scrutinized, and in view of the situation previously outlined in this decision, it is believed that Lasker and Russell bear the burden of establishing that such evidence offered on their behalf is particularly satisfactory and convincing.

We fail to find in the record anything of a documentary nature such as drawings, letters, or the like, bearing any date prior to appellees' filing date which, in our opinion, tends to corroborate the oral testimony of appellants relating to either conception or reduction to practice. The first date alleged for conception in their preliminary statement is "on or about the first day of November, 1924," with a claim that a drawing and disclosure to others was first made on or about November 21, 1924. The first written description claimed is "about two or three weeks prior to the first day of May, 1925."

The purport of the evidence relative to this drawing and disclosure is that the drawing, or sketch, was shown to a party named Capron and a party named Griffiths on or about November 21, 1924; that the sketch was subsequently lost, and that on July 9, 1926, Russell prepared an inter-office letter, which appears in the record as appellants' Exhibit 2, in which the alleged disclosure is referred to, the letter being accompanied by a sketch dated July 7, 1926, which is stated to be similar to the original sketch. The letter states, just above Russell's signature, that both Capron and Griffiths recall the original conversation and sketch and "are signifying the same by signing at the bottom of this paper." Capron's signature, however, does not appear nor was he called as a witness. No explanation was offered as to the failure to call him. At the bottom of the paper there is a typewritten line reading "The foregoing agrees with my recollection of the matter" over the signature of Griffiths. This statement is not dated, nor did either Griffiths or Russell in testifying in the interference proceeding state when Griffiths signed it. Griffiths gave some testimony relative to the sketch alleged to have been made in November, 1924, and his recollection of what is disclosed, but we do not regard it as sufficiently definite to establish that Russell (who alone is claimed to have made the sketch, Lasker being alleged to have joined in the invention of this particular feature by some suggestion of change made after he had been shown the original sketch) was then in possession of the invention.

There is testimony by a witness named Pulster, who seems to have had some connection, together with Russell, with an installation of a foot pedal controlled device for R. H. Macy & Company in 1924, out of which the conception by Russell is claimed to have originated, but Pulster's testimony, like that of Griffiths, is, in our opinion, too indefinite as to details to corroborate or substantiate appellants' claim of conception at that time.

Other evidence claimed by appellants to be added proof of conception consists of printed articles and photographic illustrations introduced as exhibits. It seems clear that the printed articles contain language applicable to a manually controlled device, and Lasker himself testified that the photographs represent a switch button combination.

As to one article, however, and the illustration accompanying it, counsel for appellants, notwithstanding Lasker's testimony, are quite insistent upon their sufficiency to show conception.

It has been stated above that appellants' claim of first written description is "about two or three weeks prior to the 1st day of May, 1925." This claim is based upon certain printed matter and an illustration which, seemingly at the instance of Russell (who, according to the record, as stated in appellants' brief, "was responsible * * * for bringing out publicity in the form of editorials in various trade papers and technical magazines"), appeared in the Banker's Service Bulletin published in May, 1925.

Russell caused to be made what was referred to in oral argument as a "synthetic photograph," by which we understand is meant a photograph retouched so that features appearing in the original are eliminated, or features not appearing in the original are introduced. It is claimed that the retouched photograph under discussion was made December 10, 1924, and that it shows "how the hook-up would look with a control bar," it being said that no control bars had at that time been manufactured.

It was this retouched photograph which was used in the Banker's Service Bulletin and accompanying it is certain descriptive matter. From our examination of the picture and the descriptive matter, we are quite convinced that they may not be taken as evidence of conception. We fail to see where the bar is shown in the photograph, or described in the printed matter, in any manner which would enable one skilled in the art to make it and apply it as the counts require. As is said by the Board:

> "* * * there appears to be nothing in this or the related exhibits that can be taken as disclosing the automatic idea of operation as distinguished from manual operation."

This disposes of the claim of conception in either November, 1924, or May, 1925, and, as of course, disposes of the claim for reduction to practice in November, 1924.

The third alternative claim of proof of conception made in appellants' brief is "in September, 1925," and since a reduction to practice is also claimed at that time the two may be considered together.

The preliminary statement of appellants alleged that the invention was embodied in a full sized machine, completed shortly after September 15, 1925, and first successfully operated in that month "in the City of Detroit, County of Wayne, and State of Michigan."

The evidence shows the installation of a device in the plant of Detroit Edison Company some time in November, 1925, but it was a device operated manually by a foot pedal, and did not give satisfaction. There is testimony to the effect that a maintenance inspector of the company with which appellants were associated, who was sent to Detroit, devised a control bar made out of bakelite; that a sketch of this bar was sent to appellants' company and that a week or ten days later a contact bar made of brass was received and installed in the Detroit plant. There is some conflict in the testimony of appellants as to when the brass bar was installed and began to work satisfactorily.

There is also testimony of the making of another bar in September, 1925. It is testified that both the latter bar and that for the Edison plant were made without drawings. These bars were not themselves produced, no drawings of them were offered, nor even a letter showing anything as to the time of their being made, shipped, or installed. The whole case rests upon oral testimony given many years after the critical dates. It is true that there were offered on behalf of appellants certain papers embraced in an exhibit marked 8, being requisitions for material and the like. Only one of these papers bears a date prior to appellees' filing date and that one, marked November 23, 1925, relates to "Power Card Design," which, as the Examiner of Interferences points out, would be as

necessary in a foot pedal combination as in an automatic combination.

[3] It is deemed unnecessary further to review or comment upon the testimony in the case. Those interested will find in the decisions below ample discussion of every material point. Appellants have not produced documentary evidence of any character which can be related to either conception or reduction to practice of the invention by them prior to the filing date of appellees, and the oral testimony of others by which they seek to corroborate their own personal testimony is not of the definite and precise nature either as to details of structure or dates when such structure was conceived, to meet the requirements of the law.

The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

GOLDSMITH *v.* VON MIHALY

No. 3,812. Decided June 7, 1937

[90 F.(2d) 359]

INTERFERENCE—PRIORITY—RIGHT TO MAKE THE CLAIMS. Record reviewed and *Held* that von M. has a right to make the claims in issue and priority was properly awarded to him.

APPEAL from the Patent Office. Affirmed.

Mr. Harry B. Grover and *Mr. Samuel B. Smith* for Goldsmith.

Mr. Robert E. Barry for von Mihaly.

GARRETT, *J.:*

This appeal brings before us for review a decision of the Board of Appeals of the United States Patent Office affirming the decision of the Examiner of Interferences awarding priority to appellee upon two counts involved in an interference declared between a patent to Goldsmith, hereinafter referred to as appellant, and an application of von Mihaly, hereinafter referred to as appellee. The counts read:

1. In combination, a scanning device for analyzing the varying intensities of light and shadow upon cyclically recurring series of elemental areas of a subject of which the image is desired, an optical system associated with the scanning device, movable means for producing relative movement between the subject of transmission and the scanning device, and automatic means operable upon movement of the movable means for maintaining in focus the optical system used in the scanning operation.

2. In a television system, a scanning device for analyzing varying intensities of light and shadow on successive elemental areas of a subject of which an image is to be transmitted, an optical system associated with the scanning device, and means for moving the optical system to automatically maintain it in focus upon relative movement of the scanning device and the subject scanned.

There are numerous assignments of error but the ultimate question to be determined is whether the counts are supported by the disclosure of appellee's application as originally filed.

This application was filed in the United States Patent Office and given the Serial Number 432,901 on March 3, 1930. It was in all material respects a duplicate of an application filed on appellee's behalf in the patent office of Germany on March 5, 1929, and he was given the benefit of his German filing date for conception and reduction to practice of the invention. Appellant's application was filed August 14, 1930, as Serial No. 475,187, and matured into Patent No. 1,924,277, granted August 29, 1933. As issued, it embraces thirteen claims. Appellee caused a number of these claims to be copied into his United States application for the purpose of interference. As to most of the claims so copied, the Examiner held *ex parte* that appellee was not entitled to make them, but it was held that he might make claims 2 and 13, and these became the counts of the issue.

Appellee did not file any drawing with his specification presented to the United States Patent Office and in the first Office action of record, the Primary Examiner tentatively rejected the application, holding the specification to be inadequate and incomplete, and said, "The invention admits of a drawing and a drawing is, therefore, required." In response to this action, appellee filed drawings and also presented numerous amendments to his written specification. Without detailing the various Office actions it is sufficient to say that the Primary Examiner at length held that Figures 1 to 5 of the drawings were admissible, being supported by his original specification, and, as has been stated, it was finally held by the Examiner that the original specification was sufficient of itself to disclose the counts.

In a decision of October 9, 1933, the Examiner said:

The specification of this [von Mihaly's] application has been altered so much by amendments that it is not clear what applicant intends to cover as his invention. Applicant is required to rewrite the specification in order to present a clear and compact copy.

Appropriate action by appellee followed and the interference was duly declared.

Following the filing of the preliminary statements, appellant moved to dissolve the interference upon the following grounds:

1. That the originally filed specification of the party von Mihaly included no drawing and no description of any workable apparatus which would support either count in issue; and

2. That any descriptive matter and illustration added to the von Mihaly application subsequent to its filing involves new matter and, therefore, the application as now pending before the Patent Office cannot support either count in issue.

Appellee made answer to the motion to dissolve, and, upon the issues presented, the Examiner of Interferences rendered an interlocutory decision denying the motion, and, holding appellee to be entitled to his foreign filing date for constructive reduction to practice, made order that appellant show cause why judgment of priority should not be awarded against him on the record.

To this order appellant responded with an argument by way of answer in which the several matters alleged in the motion to dissolve were reiterated. Thereupon the Examiner of Interferences saying that Goldsmith's response "does not raise any points which have not been fully considered and disposed of * * *," made the award of priority which subsequently met the approval of the Board of Appeals.

So far as we can discern, the arguments presented before us on behalf of the respective parties are substantially the same as those presented before the tribunals of the Patent Office. It is quite earnestly insisted on behalf of appellant that appellee was required to file a drawing or drawings with his specification, and in this connection appellant's brief quotes from Sec. 4889 R. S. (35 U. S. C. A. 34), as follows:

When the nature of the case admits of drawings, the applicant shall furnish one copy * * * and a copy of the drawing * * * shall be attached to the patent as a part of the specification.

The contention is that appellee's application should be considered as effective only from the date when he supplied the drawings in the United States Patent Office, which appears to have been April 2, 1931.

It was held by the Examiner of Interferences:

Sec. 4889 of the Revised Statutes while stating that the applicant shall furnish drawings when the nature of the case so admits, makes no statement as to when the drawings shall be furnished. While it is desirable that drawings shall be furnished when filing the other parts of the application in order to avoid any controversy as to new matter, no good reason is seen for not accepting subsequently filed drawings nunc pro tunc provided said drawings are supported by the originally filed parts of the application as is the case here.

An examination of the certified copy and sworn translation of von Mihaly's foreign filed application shows that the counts here in issue are fully supported thereby and that the party von Mihaly is entitled to avail himself of his foreign filing date of March 5, 1929.

The Board of Appeals did not specifically discuss or pass upon this phase of the controversy, but said:

After careful consideration it seems to us that the counts are so broad as to be practically commensurate with the statement above quoted from the original specification. They do not require any specific mechanism but only the scanning device and the optical system *with* very broadly means to move the optical system to automatically maintain it in proper focus or automatic means operable upon the movement of the movable means for the scanning means for accomplishing this result. This is substantially the scope of the statement of von Mihaly's original specification.

This proposition or conception is so broad that it is believed to be not beyond the skill of those working in the optical arts to accomplish it without involving invention.

Goldsmith illustrates certain specific apparatus set forth in numerous other claims of his patent but the claims on appeal do not involve any details of the apparatus only the very broad combination as above discussed.

It is our opinion that the position taken by the Examiner of Interferences upon this issue is sound as a matter of law. It is true that in the instant case the early declarations of the Primary Examiner strongly indicated that, in his opinion, there was lacking in the application as originally filed in the United States Patent Office the full and clear disclosure required by Sec. 4888 R. S. (35 U. S. C. A. 33), and this fact is strongly emphasized in the argument on behalf of appellant. However, the Primary Examiner did subsequently find in the written specification, as originally filed, and, as we understand it, without reference to the drawings, what he deemed to be ample disclosure.

In the interlocutory decision of the Examiner of Interferences is found the following:

The invention here in issue relates to a television system and more specifically to the transmitter thereof wherein the subject of transmission is automatically focussed on the scanning device regardless of the distance therebetween.

The object of the invention is accomplished by means of a scanning device and an optical system associated therewith for focussing the subject of transmission upon said scanning device. Movable means is provided for producing relative movement between the subject of transmission and the scanning device, automatic means being operable upon movement of said movable means for maintaining in focus the optical system.

From the brief on behalf of appellant we quote, with the italics as there used, the following:

Fundamentally, Goldsmith describes a television system wherein *equal detail scanning* is provided for the *complete subject* irrespective of the large variances in distance of the subject from the television scanning device. In contrast, von Mihaly describes a television system wherein *unequal detail scanning* is provided for only a *portion of the subject* (the "center of interest") with substantially fixed distance between the subject and the television scanning device. In von Mihaly any variance in distance between the subject and the television scanning device is a result of moving the subject (not the scanning device) and is only to correct focussing *defects* of the optical system.

Details of structure of both devices are then set forth and numerous differences are pointed out. That the devices are structurally different and that they operate differently is obvious. One of these differences is that appellant in, to quote from the count, "producing relative movement between the subject of transmission and the scanning device" provides means which move his optical system toward or from the subject of transmission, while appellee provides means which move the subject of transmission toward or from his optical system. The focus is maintained at the desired point by either movement. It is obvious that all that the counts at issue require as to the movement between the subject (the image of which is to be transmitted) and the scanning device is means which will provide relative movement. It seems to us clear that this requirement is as fully met by means which will move the subject as by means which will move the scanning device. Appellee was denied the right to make claims which read only upon appellant's particular structural arrangement, but, as was said by the Board, the counts at issue are quite broad. They are not limited to a device in which only the optical system is moved.

The Examiner of Interferences applied count 1 to appellee's specification in the following manner:

Count 1	*Von Mihaly*
In combination, a scanning device for analyzing the varying intensities of light and shadow upon cyclically recurring series of elemental areas of a subject of which the image is desired,	The Nipkow disc referred to in line 1, page 4 of the specification which scans the film in the kinematographic apparatus.
an optical system associated with the scanning device,	The kinematographic objective referred to in line 3, page 3 of the specification.
movable means for producing relative movement between the subject of transmission and the scanning device,	The remaining part of the kinematographic apparatus carrying the film and described in the first paragraph on page 3 of the specification.
and automatic means operable upon movement of the movable means for maintaining in focus the optical system used in the scanning operation.	The device for continuously automatically adjusting the objective in such a manner that the projection is very clear and definite and described in the first paragraph on page 3 of the specification.

Elsewhere in his decision the Examiner of Interferences quoted verbatim from appellee's original specification the features alluded to by page number in the foregoing.

From our own examination of the text of the specification as originally filed, we feel that the Examiner fairly applied the count; that count 2

may be applied in substantially the same manner, and that the Board of Appeals properly approved his decision.

Accordingly, the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

FISCHER v. AVERY

No. 3,829. Decided June 7, 1937

[90 F.(2d) 114]

INTERFERENCE—PRIORITY.

Record reviewed and *Held* that the invention in issue is not disclosed in a prior application of F., the junior party, and that F. having offered no other evidence to establish a date of invention earlier than the filing date of A., priority was properly awarded to the latter.

APPEAL from the Patent Office. Affirmed.

Mr. Albert F. Robinson for Fischer.

Mr. Oliver C. Morse for Avery.

LENROOT, *J.:*

This is an interference proceeding wherein the Board of Appeals of the United States Patent Office affirmed a decision of the Examiner of Interferences awarding priority of invention to appellee.

The interference arises between a patent issued to appellee on April 28, 1931, No. 1,802,494, upon an application filed February 16, 1925, and an application of appellant filed July 20, 1931, Serial No. 551,923. The application of appellant states that it is a division of another application, but neither the number of the latter application nor the date of filing is stated. Appellant, however, contends that his application here involved is a division of application No. 336,713, filed November 8, 1919, upon which a patent was issued to him on December 12, 1933, No. 1,939,004.

The issue consists of three counts, which read as follows:

1. The method of producing shingles tapering in thickness and having a felted fibrous foundation containing waterproofing material which comprises producing unit slabs of such material equal in area to that of a shingle and of a thickness substantially equal to the sum of the thicknesses of butt and thin ends of a desired shingle, and splitting said slabs along diagonal planes from end to end to produce two shingles from each.

2. The method of producing shingles tapering in thickness and having a felted fibrous foundation containing waterproofing material which comprises producing slabs of such material each equal in area to that of a shingle and of a substantially uniform thickness equal to the sum of the thicknesses of butt and thin ends of a desired shingle, splitting said slabs diagonally to produce two shingles from each, and coating with bituminous material the portions of the shingles exposed to the weather when laid.

3. The method of producing shingles tapering in thickness and having a felted fibrous foundation which comprises producing slabs each of a substantially uniform thickness equal to the sum of the thicknesses of butt and thin ends of the desired shingle, splitting said slabs diagonally to produce two shingles from each coating the portions of a shingle exposed when laid with bituminous material, and embedding grit in said coating.

The invention involved is sufficiently stated in the counts.

Claims corresponding to said counts were copied by appellant from appellee's patent and were contained in appellant's application 551,923 as originally filed. Figures 4 and 5 of the drawings of said application are identical with Figures 8 and 8a of appellant's application 336,713.

Appellee moved to dissolve the interference upon the ground that appellant's disclosure did not support the claims corresponding to the counts. This motion was denied by the Examiner of Interferences. In taking this action the Examiner apparently relied upon the fact that the claims corresponding to the counts here involved were a part of application 551,923 as originally filed, and in themselves constituted a disclosure of the invention, which disclosure was not inconsistent with the body of the specification.

No testimony was taken, and appellee therefore was restricted to his filing date, February 16, 1925, and appellant submitted his case upon a stipulated record, the only material portion of which is appellant's application No. 336,713, hereinbefore referred to. The Examiner of Interferences held that the counts did not read upon appellant's application No. 336,713, and awarded priority of invention to appellee. Upon appellant's appeal, the Board of Appeals affirmed the decision of the Examiner of Interferences.

If appellee, under the circumstances hereinafter set forth, is not estopped from contending that the counts here involved do not read upon appellant's application No. 336,713, so that this question is open for consideration, and if in fact the counts do read upon said application, then the decision of the Board of Appeals should be reversed, for appellant's application last named was filed prior to the filing of appellee's application.

With respect to the estoppel of appellee, appellant's contention is based upon the claim that the same invention is disclosed in both of appellant's applications, and that appellee accepted the ruling of the Examiner of Interferences that the counts read upon appellant's application 551,923; that while appellee could not have directly appealed from the order denying his motion for dissolution of the interference, he could upon appellant's appeal have raised the question of appellant's right to make the claims in his application 551,923, but failed so to do. He not only failed so to do, but in his brief before the Board of Appeals, a part of which is contained in the record, he asserted that there was no error in the decision of the Examiner of Interferences upon the motion to dissolve. Appellant's position is that, appellee having accepted the decision of the Examiner of Interferences that the counts read upon appellant's application 551,923, and inasmuch as appellant asserts that his application 336,713 is substantially the same as his so-called divisional application, appellee may not now contend that the counts do not read upon appellant's application 336,713. In support of this contention appellant cites the cases of *Braren* v. *Horner*, 18 C. C. P. A. (Patents) 971, 47 F.(2d) 358, 408 O. G. 825; *Dreyfus* v. *Lilienfeld*, 18 C. C. P. A. (Patents) 1539, 49 F.(2d) 1062, 413 O. G. 862; *Schweyer* v. *Thomas*, 21 C. C. P. A. (Patents) 859, 68 F.(2d) 953, 443 O. G. 298; and *Standard Oil Company (Indiana) et al.* v. *United States*, 283 U. S. 163.

Appellee claims that he is not estopped from raising this question, he having duly moved to dissolve the interference, and that, having won an award of priority of invention before the Examiner of Interferences, he was not required to raise every question that he might have raised to support such award. Appellee further contends that the two applications of appellant, Nos. 336,713 and 551,923, are not substantially similar, and that, even if it be held that the application here in interference, No. 551,923, does support the counts, it does not follow that appellant's application No. 336,713 supports them.

We do not find it necessary to decide whether appellee would be estopped from contending that the counts do not read upon appellant's application 336,713 if said application was substantially similar to application 551,923, for we find that there is a marked and substantial difference in the two applications. While it is true that two of the drawings in each of the applications are identical, the specifications with respect to such drawings are very different. These drawings in application 336,713 are numbered 8 and 8a. In said application the specification states:

Individual shingles 5, 5a may be coated in accordance with the present invention and applied face to face as suggested in Figures 8, and 8a in order to preserve their self-adhering quality during shipment, the shingles being *rolled apart* at the time of applying them to a roof, and the application being over a previously prepared surface of roofing paper or other material. These shingles may be of any desired shape, and may be of uniform thickness as shown at 5 (Figure 8), or tapering in thickness as shown at 5a (Figure 8a). The method of developing self-adhering surfacing members and packaging the same as suggested in Figures 8 and 8a, is applicable to paving or flooring blocks or material as well as to roofing shingles. [Italics ours.]

Nowhere in the specification are the words "split", "unit", or "slab" found. The application speaks of pre-formed shingles stuck together being "rolled apart." While the word "split" is broadly defined by the dictionaries, we have found no definition of that word that would include a rolling apart of two pieces of material.

On the other hand, appellant's application 551,923 repeatedly uses the terms "units", "slabs", and "split", and as hereinbefore noted the counts here involved were claims in said application as originally filed and formed a part of the disclosure.

Upon this point the Examiner of Interferences stated:

It is to be noted that the idea in application 551,923 is different from that in application 336,713. In the former there is no separate prior existence of the shingles as individual shingles. The so-called slabs are formed from a composite sheet. In the latter, individual shingles are coated and stuck together for shipment, to be afterwards separated on the job. The counts were original claims in application 551,923, which was filed after the Avery patent issued. The interlocutory decision appears to have been based upon this fact:

"Claims 1, 2, and 3 of the Fischer application are also original claims thereof and are part of the Fischer original disclosure. Under such circumstances, when the claims are not indefinite or inconsistent with the body of the specification, they are in themselves a sufficient disclosure of the counts."

The Fischer specification uses the terms "splitting", "unit" and "slab". No corresponding disclosure is found in Fischer application 336,713. For these reasons it must be held that the earlier application does not support count 1.

The disclosure of application 336,713 seems to be of an entirely different invention from that here involved, and is entirely consistent with the drawings shown in said application. It is clear that the counts before us do not read literally upon appellant's application 336,713, and they are clearly not within the spirit of its disclosure. It seems quite apparent that application 551,923, filed after the Avery patent was issued, was prepared with a view of interference with said patent, not only in copying the claims, but also in describing the invention involved in the counts.

We are clear that the counts do not read upon appellant's application 336,713, assuming that they do read upon application 551,923; hence appellant is not entitled to the filing date of application 336,713 as the date of his invention, but must rely upon the filing date of his application here in interference, which is subsequent to the filing date of appellee.

For the reasons stated, the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

MORGENSTERN AND HACKENBERG v. BURTON

No. 3,810. Decided June 7, 1937

[90 F.(2d) 270]

1. INTERFERENCE—ISSUE CONSTRUED.

The term "thyratron tubes" as used in the claims in issue *Held* broad enough to include the tubes shown and described in B's. application as filed.

2. SAME—PRIORITY—RIGHT TO MAKE CLAIMS.

Record reviewed and *Held* that B. has a right to make the claims in issue and priority was properly awarded to him.

APPEAL from the Patent Office. Affirmed.

Mr. Eugene C. Brown for Morgenstern et al.

Mr. J. W. Schmied for Burton.

LENROOT, *J.:*

This is an interference proceeding in which the Board of Appeals of the United States Patent Office affirmed a decision of the Examiner of Interferences awarding priority of invention to appellee, and appellants have brought the matter before us for review.

The interference arises between an application filed by appellee on May 21, 1930, and a patent issued to appellants on November 28, 1933, upon an application filed October 5, 1931. Appellee, being the first to file, is the senior party. Appellants derive no advantage over appellee by reason of the issue of their patent, as appellee's application was copending at the time of the issue of said patent.

But one count is involved, which was copied by appellee from appellants' patent. The count reads as follows:

1. A system for converting a non-continuous wave made up of peaked current impulses into a square-top continuous wave, comprising a pair of thyratron tubes and matched input and output circuits therefor, said input circuits comprising means for applying peaked non-continuous current impulses to said thyratron tubes as starting voltages therefor, said output circuits comprising means for causing the starting of either tube to stop the other tube, whereby the peaked impulses cause the production in the combined output circuit of the thyratron tubes of contiguous square-top impulses to produce a wave continuous in character.

The invention relates to the art of telegraphy, wherein peaked waves as received are converted into square-topped waves. Within the motion period following the declaration of the interference, appellants moved to dissolve the interference upon the ground that appellee had no right to make the claim corresponding to the count, the reason given being that appellee's application, as originally filed, did not disclose the invention, and that amendments subsequently filed constituted new matter.

The motion was denied by the Primary Examiner, and thereafter the Examiner of Interferences entered judgment upon the record against appellants, awarding priority of invention to appellee, following an order to show cause issued by him.

Upon appeal to the Board of Appeals, it was held that the motion to dissolve the interference was properly denied by the Primary Examiner, and, that being the only issue involved, the decision of the Examiner of Interferences was affirmed.

The only issue going to the merits of the case is whether appellee's application, as originally filed, discloses the use of "thyratron" tubes or their equivalents. It will be observed that the count involved specifically refers to "thyratron" tubes, and it is conceded that, in order for appellee to prevail, his original application must disclose the use of such tubes or their equivalents.

Before discussing this question, we will refer to a preliminary matter raised by appellee. He moves to strike from the record an affidavit by one Frederick Holborn, and from the brief of appellants a statement with respect to alleged tests of thyratron tubes made by appellants.

It appears that appellants filed an affidavit by one Frederick Holborn respecting the meaning of the term "thyratron tubes." This affidavit was filed while appellants' appeal was pending before the Board of Appeals. The Board of Appeals in its decision made no reference to this affidavit, and we have not considered it in arriving at our conclusion herein. Nothing in the rules of the Patent Office permit the filing of affidavits in interference cases after appeal to the Board of Appeals.

It also appears that in appellants' brief before the Board of Appeals, quotation was made from a letter purporting to have been written by Dr. Hull, hereinafter referred to. Appellee objects to the consideration of the quotation for the reason that the letter was not properly authenticated and only a portion of the letter was quoted from. The Board of Appeals made no reference to this letter, and we have not considered it, for the reasons stated by appellee.

With respect to the statement in appellants' brief respecting tests with thyratron tubes, there is nothing in the record to support the statement, and we have given it no consideration.

There is only one question before us upon the merits of the case, viz., whether appellee's application, as originally filed, discloses the use of "thyratron" tubes or their equivalent. In appellants' patent their tubes are not described other than by the name "thyratron." In appellee's application, as originally filed, the term "thyratron" is not found.

It appears that the term "thyratron" is a trademark owned by the General Electric Company, which mark was registered in the United States Patent Office on June 17, 1930, registration No. 271,600, used for "Grid-Controlled Arc Tubes." As hereinbefore noted, the tubes disclosed in appellants' patent are described as "thyratron" tubes, and not otherwise. The tubes disclosed in appellee's application as originally filed are there described as follows:

> The three-electrode gas-filled glow discharge tubes used in the present invention may be produced by filling a highly evacuated small amplifier tube of the usual type with argon to a pressure of approximately 0.1 mm. of mercury. Other similar gases at suitable pressures may also be used. Such three-electrode tubes differ from tubes structurally the same but highly evacuated in that the grid is effective as a control element only for low values of plate current. If the grid is carried from the filament potential toward a more positive potential, a point is reached where the glow discharge within the tube begins and the plate current rises to a value determined by the "B" battery voltage and the plate circuit resistance. Once the glow discharge is started the control of the grid is greatly reduced and becomes very small as the plate current rises to an appreciable value. Since the grid control practically disappears for high values of plate current it is necessary to provide some means for breaking the glow very shortly after it is started. The methods employed for doing this will be described in connection with the detailed description of the drawings.

On June 15, 1934, more than four years after the filing date of appellee's application, the following amendment was made thereto:

> —the name "thyratron" has been applied to tubes of this type in articles entitled "Gas-filled Thermionic Tubes" by A. W. Hull, published in the Journal of the American Institute of Electrical Engineers, November, 1928, page 802; and "Hot-cathode Thyratrons" by A. W. Hull, published in the General Electric Review for April, 1929 and July, 1929, vol. 32, pages 213–223 and 390–399. In this specification tubes of this type will be called glow-discharge tubes, thermionic gas tube relays, thyratrons, gas-filled discharge devices, glow-discharge devices, gaseous discharge tubes, etc.—

For the purposes of this case we may ignore this amendment, for unless "thyratron" tubes or their equivalents are disclosed in appellee's application as originally filed, said amendment would concededly be new matter.

The Board of Appeals held that, as the term "'thyratron" is not defined in appellants' patent, the term

> "must be construed broadly as referring to a tube of this general type which will operate in the system."

For the meaning of the term "thyratron" the Board of Appeals relied upon certain published articles prepared by Dr. Albert W. Hull of the Research Laboratory of the General Electric Company, a portion of which articles appear in the record. One of said articles was published in vol. 32, No. 4, of the General Electric Review in April, 1929; the other, it appears, was published in July, 1928. Appellants rely upon these articles as showing that appellee's application, as originally filed, does not disclose "thyratron" tubes, and appellee relies upon the same publications as showing that the tubes disclosed by him are the equivalents of, or have the same characteristics as "thyratron" tubes as described by Dr. Hull.

The Board of Appeals, after quoting from said articles by Dr. Hull, stated, with respect to the characteristics and functions of "thyratron" tubes, as follows:

> Taking the entire article of Hull into consideration, it is evident that a thyratron is a grid-controlled arc tube or three electrode tube similar to a Pliotron, into which, after exhaust, a small amount of gas is introduced; and in which the grid or control element controls the starting of a discharge but is usually unable to stop the discharge. It also shows that thyratrons are not limited to any such specific structure as Morgenstern et al. contends, since in some, the grid may shield the entire cathode, while in others, it does not. It also shows that thyratron tubes can and have been made by introducing a small amount of gas at a low-pressure into a tube structure designed as a high-vacuum or Pliotron tube. It also shows that improved results can be obtained by modifying such structures so that the grid will completely shield the cathode.

The Board, in its decision denying a motion for reconsideration made by appellants, said:

> • • • we do not believe it is proper to hold that a thyratron, as the term is used in the patent, must have a grid which shields the whole cathode from the anode. We, therefore, stated in our decision that the term "thyratron" must be construed broadly as referring to a tube of this general type which will operate in the system. By "general type" we mean a gas filled tube in which a grid is employed to set it in operation.

Appellants insist that the Board of Appeals misapprehended the statements in the articles of Dr. Hull in that it assumed that the grid must physically shield the cathode, while in fact the shielding referred to by Dr. Hull is an electrostatic phenomenon made possible by the physical structure, and that thyratron tubes must permit the creation of this electrostatic phenomenon, and that the tubes disclosed by appellee do not permit this because of the shortness of the grids. Appellants state:

> • • • It is not the physical grid which shields the anode from the cathode, but rather the invisible electrostatic field set up by the potential of the grid and this grid field must completely shield the cathode from the anode.

We think appellants' contention that the shield referred to in Dr. Hull's articles embraces electrostatic phenomena as well as physical structure is correct. While certain figures in the article published in the April, 1929, number of the General Electric Review show that the grid structurally does not completely shield the cathode, we think that the article taken as a whole shows that the shielding referred to by Dr. Hull was in the form of an electrostatic field, rather than in the form of physical structure alone. However, it does not follow that tubes permitting only a partial shielding by electrostatic phenomena are not embraced within the term "thyratron tubes."

Appellants rely upon certain statements found in Dr. Hull's articles, a few of which we quote. The following are found in the article published in July, 1928:

> 3. The grid must shield the whole cathode from the anode. In high vacuum tubes the protrusion of 5 per cent of the filament beyond the end of the grid results only in 5 per cent "zero" current, which has no effect on operation except to reduce the useful power by this amount. As a thyratron such a tube is nearly worthless. It will pass full current at all reasonable grid voltages, since a small fraction of one percent of the total emission is sufficient to produce ions that will sheathe the grid. The uniformity of the grid is more important than in high vacuum tubes, since the amplification factor is determined entirely by the largest hole.
>
> This requirement of complete shielding makes even the small pliotrons of most standard types unsuitable for conversion into thyratrons by introducing gas, because of the shortness of the grids.

In the same article we find the following:

> The name thyratron • • • has been suggested for an arc whose starting can be controlled by a grid. It has been known for a long time that arcs could thus be controlled. • • • They have been the subject of an exhaustive study in this laboratory, under the direction of Dr. Langmuir, for several years, and the results of these investigations will soon be published by Langmuir and his associates. • • • Only the specific characteristics of hot-cathode thyratrons similar to the above rectifiers, which are very simple, will be described here.
>
> Figs. 23 and 24 show typical hot cathode thyratrons of this type. Their structure is identical with that of pliotrons except for the form of cathode and the limitations of filament voltage and grid size noted below.
>
> Their characteristics are also the same as pliotrons *when no plate current, or very little, is flowing.* The distribution of potential in the tube is then obviously the same as in a high-vacuum tube. The amplification factor is defined, as in ordinary vacuum tubes, as the ratio of plate to grid voltage that will keep the plate current at a constant small value. This factor determines at what grid voltage the tube will "start." [Italics quoted.]
>
> • • • • • • •
>
> As soon as plate current begins to flow the similarity to pliotrons ends. Such factors as mutual conductance and plate resistance do not exist, for the grid is instantly surrounded by a sheath • • • of positive ions, and has no further effect on the current.

From the article by Dr. Hull published in April, 1929, we quote the following:

> The requirements of thyratron grids differ in several respects from those of pliotron grids, and it is desirable to state these requirements briefly before describing the types of grid that have been found practical. They can, perhaps, be most simply pictured by pointing out the difficulties which are encountered on attempting to use pliotrons of standard types as thyratrons.
>
> The most serious difficulty, especially with the smaller pliotrons, is *incompleteness* of the grids. They are too short to shield the whole filament. This results in a small uncontrolled emission, so small that it is unobjectionable in a pliotron, but in a thyratron it determines the grid-control ratio, giving a ratio so large, often greater than unity, that the tubes are not very useful. • • • [Italics quoted.]

It seems to be conceded that a pliotron is a high vacuum tube, into which no gas has been introduced.

Had the articles by Dr. Hull clearly set forth that a "thyratron" tube must be structurally different from a pliotron tube, we would conclude that the Board of Appeals erred in holding that appellee's application, as originally filed, disclosed, without so naming them, "thyratron" tubes or their equivalents, but we find in his article published in April, 1929, a Fig. 14, below which is the notation:

> Fig. 14. Plate Current vs. Grid Voltage in a Pliotron UV–203A, and a Thyratron which Was Made from the Same Tube by the Addition of 0.005 Mm. Mercury Vapor.

The article also states, with respect to said Fig. 14, and also with respect to Fig. 15, as follows:

> • • • For purposes of comparison the thyratron might be said to have infinite mutual conductance and zero plate impedance. Figs. 14 and 15 show these characteristics, plotted to scale, for the 50-watt pliotron, UV–203A, with and without gas, *i. e., as thyratron and pliotron respectively.* [Italics ours.]

From the above it would seem that, in the opinion of Dr. Hull, a pliotron tube may be converted into a thyratron by introducing a certain quantity of gas into the pliotron tube. Dr. Hull states:

> The best range of *gas pressure* in a thyratron is between 1 and 50 microns for mercury vapor, for other gases, especially helium, it is somewhat higher.

Appellee's application, as originally filed, states:

> The three-electrode gas-filled glow discharge tubes used in the present invention may be produced by filling a highly evacuated small amplifier tube of the usual type with argon to a pressure of approximately 0.1 mm. of mercury. • • •

[1, 2] While the last quoted statements from Dr. Hull's article may be inconsistent with other statements found in the article, we are of the opinion that the term "thyratron" must be construed broadly, as held by the Board of Appeals; and inasmuch as

some of the statements in Dr. Hull's articles defining "thyratron" tubes embrace the tubes disclosed by appellee, we are constrained to hold that the Board of Appeals did not err in holding that appellee could make the claim corresponding to the count here involved, in view of the disclosure in appellee's application as originally filed.

For the reasons stated herein, the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

BROOKS AND ALLEN

No. 3,895. Decided May 29, 1937
[90 F.(2d) 106]

PATENTABILITY—PROCESS OF DETERMINING THE HUMIDITY OF A STREAM OF AIR.

Certain claims for a process of determining the humidity of a stream of air *Held* unpatentable since they do not embrace the steps by which the beneficial result is obtained, but certain more specific claims *Held* patentable.

APPEAL from the Patent Office. Modified.

Mr. J. F. Mothershead, Mr. E. R. Weisbender, and *Mr. Paul P. Stoutenburgh* for Brooks and Allen.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.:*

This is an appeal from a decision of the Board of Appeals of the United States Patent Office, affirming a decision of the Examiner, rejecting claims 39 to 44, inclusive, of appellants' application. The involved claims are process claims; certain apparatus claims were allowed.

Claims 39, 41, and 42 are illustrative of the claims in issue and read as follows:

39. Steps in the process of determining the humidity of a stream of air which consist in obtaining the temperature of said air, maintaining an evaporating liquid at substantially adiabatic evaporation temperature with respect to the particular stream of air being tested and obtaining the evaporation temperature thereof for comparison with the temperature of said air.

41. In the process of computing the vapor content of a gas from the respective temperatures of the gas and a liquid evaporating into said gas, the step of bringing the liquid supplied for evaporation to substantially adiabatic evaporation temperature with respect to the gas to be tested by evaporating a portion of said liquid supply into the gas prior to supplying said liquid for temperature measurement.

42. In a system for determining the vapor content of a gas involving the transfer of a liquid into a gas by evaporation in which the temperature of said liquid is lowered, *the steps of cooling said liquid to substantially adiabatic evaporation temperature with respect to said gas, further cooling a portion of said liquid by gas circulation, and thereafter measuring the temperature of the further cooled liquid.* [Italics ours.]

The references cited are: Bristol et al., 1,586,351, May 25, 1926; Irwin, 1,601,243, September 28, 1926; Armstrong, 1,636,350, July 19, 1927; Guthrie et al., 1,894,172, January 10, 1933.

The alleged invention is described by the Board of Appeals as follows:

This application relates to a psychrometer and appellants have devised an arrangement whereby wet fibrous material is caused to surround the wet bulb thermometer and the air passing over the perforated portion of the tube surrounded by the fibrous material will cause the water in the fibrous material to evaporate and thereby bring the water supplied to the wick of the wet bulb to substantially the evaporation temperature of the water as it passes in the form of vapor from the wick of the wet bulb into the air.

We find it unnecessary to describe the references for the reason that it is admitted that certain of the steps recited in the claims are disclosed in said references, while the Examiner conceded that certain other alleged steps hereinafter discussed are not so disclosed.

In claim No. 39, which is illustrative also of claims 40, 43, and 44, the alleged step not disclosed by the references is that element reading

"maintaining an evaporating liquid at substantially adiabatic evaporation temperature with respect to the particular stream of air being tested."

The Examiner stated that

"this additional purported step did not define an act to be performed with sufficient particularity as required by the Revised Statute 4888,"

and further stated as follows:

• • • This step did not define how an evaporation liquid was to be maintained at substantially adiabatic evaporation temperature with respect to the particular stream of air being tested. The definition of how an evaporation liquid is maintained at substantially adiabatic temperature with respect to the particular stream of air being tested is the gist or crux of the contribution of the applicants to the prior art. • • •

Upon this point the Board stated:

As we understand the situation, experts in this art found it necessary to make allowance for the fact that the temperature of the liquid was not at its evaporating temperature, and we believe that it was obvious to them that if the liquid had been substantially at that temperature, the allowance would not have been necessary. Therefore, even if appellants are the first to discover a means for reaching this obviously desirable end, we do not consider that they are entitled to cover all ways of accomplishing it, no matter how remote they might be from that devised by them, and we therefore are of the opinion that the Examiner was justified in rejecting the broad claims on appeal.

We are in accord with the conclusion reached by the Patent Office tribunals with respect to claims 39, 40, 43, and 44. We think the alleged step claimed to be novel merely states the result or effect of a step of a process not embraced in the claims. Appellants' invention, if any there be, consisted in the method of

"maintaining an evaporating liquid at substantially adiabatic evaporation temperature with respect to the particular stream of air being tested."

We agree with the Board that the desirability of the result set out in the above quoted element of claim 39 would be obvious, and the problem to be solved was how to secure this result. Upon this point claims 39, 40, 43, and 44 are silent.

It is well established that

"It is for the discovery or invention of some practicable method or means of producing a beneficial result or effect, that a patent is granted, and not for the result or effect itself."

Corning et al. v. *Burden,* 15 How. 252. See also *In re Caunt,* 23 C. C. P. A. (Patents) 855, 81 F.(2d) 405, 465 O. G. 461; *In re Marshall,* 19 C. C. P. A. (Patents) 832, 54 F.(2d) 421, 416 O. G. 538.

To entitle appellants to a patent, their claims should embrace the steps by which the beneficial result is secured. Having failed to do so, claims 39, 40, 43, and 44 lack patentability for the reasons given by the Examiner and the Board.

With respect to claims 41 and 42, however, this omission is supplied, and the claims purport to set out the method by which the result is secured. In claim 41 it is stated that the result is secured

"by evaporating a portion of said liquid supply into the gas prior to supplying said liquid for temperature measurement,"

and in claim 42 the same step is stated in different language.

With regard to these steps recited in claims 41 and 42, the Examiner stated that

"Merely evaporating a portion of said liquid supply into the gas, per se, does not necessarily bring the liquid to substantially adiabatic evaporation temperature."

Appellants' specification, however, does state that the quoted step will bring the liquid to substantially adiabatic evaporation temperature. There was also introduced into the record an affidavit by Brooks, one of the appellants, which states that the affiant conducted a number of tests and demonstrated, as we construe the affidavit, that the statement in appellants' specification upon this point is correct.

The Board of Appeals in its decision did not specifically discuss claims 41 and 42, and apparently assumed that there was no substantial distinction between these claims and claim 39, which it set out as illustrative of all the claims. Although there was a general affirmance of the decision of the Examiner by the Board, we are not convinced that the Board did not inadvertently overlook the distinction between these claims and claim 39, and we are not disposed to accept the opinion of the Examiner in the face of positive recitals in appellants' application, and in the face of the affidavit above referred to. At least, there is sufficient doubt in our minds as to the correctness of the conclusion of the Examiner upon this point to warrant the application of the rule that the doubt should be resolved in favor of the appellants. In this view of the case, claims 41 and 42 are patentable, for it is conceded that the steps here under consideration, recited in said claims, are not found or suggested in the references.

Being of the opinion that claims 41 and 42 do properly embrace steps of a true process in full compliance with §4888 of the Revised Statutes, and that such steps are not disclosed by the references, the decision of the Board of Appeals is reversed with respect to claims 41 and 42, and, for the reasons hereinbefore stated, it is affirmed as to claims 39, 40, 43, and 44.

Modified.

Patent Suits

[Notices under sec. 4921, R. S., as amended Feb. 18, 1922]

1,100,319, H. Moore, Rubber, D. C., S. D. N. Y., Doc. E 60/161, *H. Moore* v. *U. S. Rubber Co.* Doc. E 60/162, *H. Moore* v. *Miller Rubber Co.* Dismissed without prejudice (notice Oct. 1, 1937), in both cases.

Changes in Classification

Order No. 3,413, December 1, 1937, directs:

In *class 12, Boot and Shoe Making* (Division 11), establish the following subclasses and definitions:

Sole machines

41.1 Pliabilizing soles in a shoe.
41.2 Pliabilizing soles
41.3 With fluid treatment.

Formers

129.4 Heated.

41.1. Means for flexing or making the shoe sole in a shoe pliable.

41.2. The shoe sole per se as an article or as a sole strip is flexed or otherwise made pliable.

41.3. Means under subclass 41.2 in which the sole is treated with a moistening fluid, generally a liquid, while being flexed.

Note.—For analogous art for coating, see class 91, COATING, subclass 17.

129.4. Formers under subclass 128 provided with heating means.

The patents contained in subclasses 41.1, 41.2, and 129.4 have been taken for the most part from various subclasses in class 12, and those in subclass 41.3 for the most part from class 91, Coating, subclass 17.

In *class 91, Coating* (Division 46), subclass 17, add to the definition the following note:

Note.—For moistening and flexing soles and sole material, see class 12, BOOT AND SHOE MAKING, subclass 41.3.

In *class 234, Recorders* (Division 41), abolish the following subclass with its definition:

34 Volume.

The patents formerly contained in this subclass have been placed for the most part in class 234, principally in subclass 2, and in class 221, Dispensing, subclass 95, and indented subclasses.

In *class 257, Heat Exchange* (Division 32), subclass 261, add to the definition the following note:

(3) Note.—For general cylinder construction see class 309, MACHINE ELEMENTS, CYLINDERS AND PISTONS, subclass 2, and for making cylinders see class 29, METAL WORKING, subclass 156.4.

In *class 195, Chemistry, Fermentation* (Division 63), in note (1) following the main class definition cancel the words "including fermentation along with other steps", and substitute therefor: *that include fermentations and are,* and cancel the word "combined"; add to the class definition the following note:

(2b) Note.—Processes of making chemical compounds that include fermentations are controlling for classification over other processes of making chemical compounds. Claims for chemical compounds are controlling for classification over claims for processes of making the compounds, respectively;

change the title of subclass 29 to read:

Ultimate processes or products

29 Proteins or amines, fermentation of,

cancel the word "hydrolytic" in the definition, and at the end of the definition add the following:

excluding processes which include mere oxidative, or reductive, fermentations but do not include any other kind of fermentation.

In *class 309, Machine Elements, Cylinders and Pistons* (Division 12), following the definition of subclass 2, number the existing note (1) and add the following note:

(2) Note.—For cylinders having means to dissipate heat, see class 257, HEAT EXCHANGE, subclass 261. For method of making cylinders, see class 29, METAL WORKING, subclass 156.4, and class 22, METAL FOUNDING.

TRADE-MARKS

OFFICIAL GAZETTE, DECEMBER 14, 1937

[VOL. 485. No. 2]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly-Prepared Materials

Ser. No. 397,913. CAMILLE J. ROCQUIN, doing business as Wild Rose Nursery, New Orleans, La. Filed Sept. 28, 1937.

Creole

For Prepared Soil Including Peat Soil and Only a Small Amount of Fertilizing Constituent and Usable Both Alone and in Admixture with Other Soils, Principally for Improving the Texture Thereof and Having Only a Small Fertilizing Value.

Claims use since July 9, 1937.

Ser. No. 398,393. EASTERN COAL CORPORATION, Bluefield, W. Va. Filed Oct. 12, 1937.

RED ROBIN

For Bituminous Coals.

Claims use since Sept. 14, 1937.

Ser. No. 398,769. GEORGIA KAOLIN COMPANY, Elizabeth, N. J. Filed Oct. 21, 1937.

PIONEER

For Clay Used in the Manufacture of Ceramic Wares.

Claims use since Sept. 10, 1937.

CLASS 2

Receptacles

Ser. No. 397,445. K-NINE DINER CORPORATION, Cleveland, Ohio. Filed Sept. 15, 1937.

K-NINE DINER

The drawing is lined for red.

For Trays, Troughs, Receptacles, Dishes, Food Containers, Feeding Devices and Food Supporting Means for Feeding Animals, Beasts, and Fowl.

Claims use since June 21, 1937.

CLASS 3

Baggage, Animal Equipments, Portfolios, and Pocketbooks

Ser. No. 396,367. SOL MUTTERPERL, INC., New York, N. Y. Filed Aug. 13, 1937.

DEBU-TEEN

For Ladies' Handbags of Imitation Leather.

Claims use since Aug. 9, 1937.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

Ser. No. 389,697. ROUX LABORATORIES, INC., New York, N. Y. Filed Mar. 5, 1937.

The word "Roux" is disclaimed apart from the mark.

REISSUES

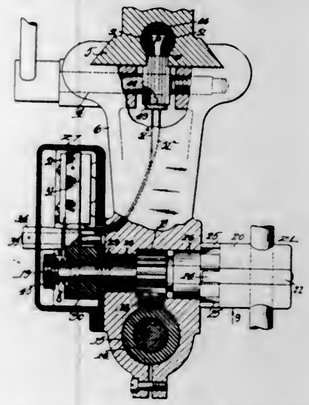
DECEMBER 14, 1937

20,578
METHOD OF TREATING FOOD PRODUCTS AND RESULTING PRODUCT

Samuel Henry Ayers and Charles W. Lang, Philadelphia, Pa., assignors, by mesne assignments, to Crown Can Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Original No. 2,054,066, dated September 15, 1936, Serial No. 629,719, August 20, 1932. Application for reissue September 2, 1937, Serial No. 162,210

15 Claims. (Cl. 99—155)



1. The method of treating fruit juices which includes the steps of concentrating a quantity of fruit juice to about 90% of its original volume, placing such concentrated fruit juice in a plurality of final containers, subjecting the fruit juice in the final containers and at a suitable temperature to the action of steam passing therethru at a sterilizing temperature, and sealing all the containers with substantially the same pressure therein.

20,579
HAND OPERATED, ELECTRIC CONTROLLED, TAPPING DEVICE

Benjamin S. T. Bishop, Shrewsbury, and Percival E. Dow, Leicester, Mass., assignors to Leland-Gifford Company, a corporation of Massachusetts

Original No. 1,970,218, dated August 14, 1934, Serial No. 715,932, March 16, 1934. Application for reissue August 12, 1936, Serial No. 95,698

39 Claims. (Cl. 10—136)

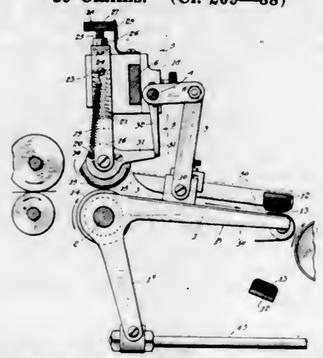
1. In a tapping machine, the combination with a reciprocable spindle for supporting a tap and a reversible motor for rotating the spindle, of a solenoid having means for reversing the motor, a sliding head, a pair of wires insulated from each other, said wires being connected with the solenoid, a pair of brushes carried by the sliding head, each in contact with one of said wires, a switch for electrically connecting said brushes, a switch finger for closing the switch, and means whereby, when the spindle descends the switch finger will be operated to close the switch.

20,580
SCREW

Frank K. Brown, South Dartmouth, Mass., assignor to Continental Screw Company, New Bedford, Mass., a corporation of Massachusetts

Original No. 2,062,550, dated December 1, 1936, Serial No. 734,034, July 6, 1934. Application for reissue March 2, 1937, Serial No. 128,681

3 Claims. (Cl. 85—47)



2. A self-tapping screw fastener of the kind described having a head, a cylindrical shank constituting a holding portion formed with continuous threads throughout the greater length of said shank, a blunt rectangular entering end formed with flat faces extending from each side of the rectangular end at a slightly flaring angle, said flat sides reaching to the thread-holding portion, the flaring flat faces providing correspondingly flaring corners between said flat faces from the blunt entering end to the thread-holding portion, and cutting threads on said corners whereby a self-centering blunt-ended screw with a thread-cutting portion and a continuous thread-holding portion is provided.

20,581
BLANK CONVEYING APPARATUS

William Ward Davidson, Evanston, Ill.

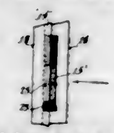
Original No. 1,930,510, dated October 17, 1933, Serial No. 320,856, November 21, 1928. Renewed February 13, 1933. Application for reissue October 16, 1935, Serial No. 45,300

39 Claims. (Cl. 209—88)

1. In combination, blank conveying means, a movably supported member for diverting blanks exceeding a predetermined thickness from a contemplated path, a caliper for detecting blanks of excess thickness comprising a movable member, and means for supporting said diverting member in non-diverting position comprising means in association with said movable caliper member, and means separate from said movable caliper member, operable during the calipering operation and arranged to disengage said mov-

able caliper member and said diverting member, thereby freeing said movable caliper member.

17. In conveying apparatus for sheets of paper, constituting blanks, the combination of calipering means comprising a rotatable member, and a movable member having a blank contacting surface opposed to the rotatable member, said members being spaced apart sufficiently to permit the undetected entrance and passage there-between of blanks of a predetermined thickness, blank gripping and advancing rolls associated with the calipering means and adapted to convey blanks through and discharge them from the calipering means, the construction being such that the blank contacting surface of the caliper means is disposed substantially in the transverse plane of the gripping and advancing rolls but not rearwardly thereof so that the rolls grip the forward edges of the blanks substantially at the instant but not later than when said forward edges of the blanks reach the calipering members, and means for diverting blanks exceeding the predetermined thickness from a predetermined normal line of feed of single blanks.



20,582

ART OF COMPOSITE PHOTOGRAPHY

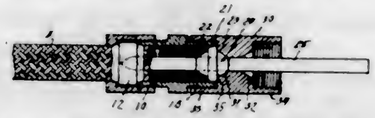
Charles B. Dreyer, Los Angeles, Calif., assignor to Henry F. Beeger, Los Angeles, Calif.

Original No. 2,056,508, dated October 6, 1936, Serial No. 733,403, July 2, 1934. Application for reissue November 28, 1936, Serial No. 113,266

12 Claims. (Cl. 88—16)

1. In a method of forming a composite photograph from two separate negatives bearing a background image and a foreground image respectively, the steps of: forming a latent unstable image of the background image upon the final negative by printing the background negative upon the final negative with light of wave lengths shorter than about 0.5 micron; then rendering the latent background image undevelopable in those portions only in which the foreground image is to be recorded, by subjecting those portions of the latent image upon the final negative to light of wave lengths longer than that to which the final negative emulsion is sensitive; forming a latent unstable image of the foreground image in those portions of the final negative in which the background image was rendered undevelopable; and finally developing such final negative and exposing it to light of substantially the entire spectrum during such developing to produce a composite photograph containing desired portions of the background image and the foreground image.

20,583



FLEXIBLE TUBING

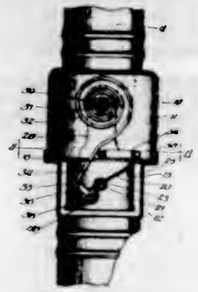
Stephen Guarnaschelli, Corona, Long Island, N. Y., assignor to Packless Metal Products Corporation, New York, N. Y., a corporation of Delaware

Original No. 2,041,543, dated May 19, 1936, Serial No. 713,825, March 3, 1934. Application for reissue August 31, 1937, Serial No. 161,808

7 Claims. (Cl. 285—72)

1. In combination, a flexible metallic, corrugated tube, a coupling member surrounding an end portion of the tube, means for anchoring said member at a point spaced from said end, against movement in the direction of said end, the inner surface of said member being spaced from the outer surface of the end portion of the tube, a second coupling member threaded to said first coupling member and enclosing a conical

projection arranged to engage the end of the tube and as said second coupling member is threaded on said first coupling member to compress the end of the tube, beyond said anchor point, into a substantially solid mass and for forming a seal between the tube and conical projection.



20,584

THERMOSTATIC VALVE

Peter J. Jorgensen, deceased, late of Elmhurst, Ill., by Clarence H. Jorgensen, administrator, Anderson, Ind., and Clarence H. Jorgensen, Anderson, Ind.

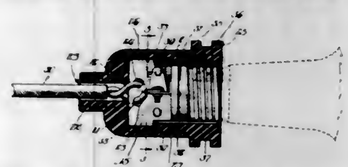
Original No. 1,991,392, dated February 19, 1935, Serial No. 576,526, November 21, 1931. Application for reissue April 13, 1935, Serial No. 16,268

17 Claims. (Cl. 236—34)

3. A temperature responsive control system comprising a casing adapted to conduct fluid flow therethrough, a shell disposed within said casing, a valve movably supported by said shell and adapted to control the flow of fluid through said casing, spaced brackets carried by said shell, a flat fluid filled expansible bellows arranged edgewise with respect to the flow through the casing, a lever fulcrumed on one of said brackets and connected with said valve at one end and at its other end with one end of the bellows, that end of said bellows being thereby supported by said lever from said one bracket, and means connecting the other end of the bellows with the other bracket.

20,585

ELECTRIC SOCKET AND CASING



Francis C. Kollath, Chicago, Ill., assignor of one-half to Daniel Woodhead, Evanston, Ill.

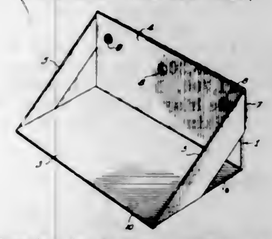
Original No. 2,018,134, dated October 22, 1935, Serial No. 436,289, March 17, 1930. Application for reissue May 8, 1936, Serial No. 78,725

11 Claims. (Cl. 173—358)

1. In combination, a flexible rubber open-ended casing having alined grooves extending from the margin of the opening, said grooves merging with deeper grooves and providing shoulders, a flat

base in said casing and engaging said grooves, said base having projections received in said deeper

grooves, said projections providing shoulders engaging the first shoulders and holding the base in position.



20,586

ELEVATOR BUCKET

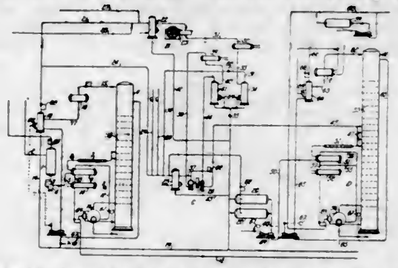
Leonard C. Ponting, Pawtucket, R. I., and Arthur G. Kliwer, Abilene, Kans.

Original No. 2,031,064, dated February 18, 1936, Serial No. 718,841, April 3, 1934. Application for reissue June 19, 1937, Serial No. 149,264

4 Claims. (Cl. 198—152)

2. An elevator bucket for endless carrier belts operating within conveyor housings having side walls traversed by the sides of the bucket, comprising a horizontal bottom, an upwardly projecting back wall at the rear edge of said bottom, and side portions forming bottom supporting members connecting the forward portions of the ends of said bottom with upper portions of said back wall, both of said side portions being constructed to provide air vent openings at the corresponding sides of the bucket in position for traversing the inner faces of the side walls of the conveyor housing and located substantially within the planes of the corresponding sides of the bucket.

20,587



METHOD OF RECOVERING HYDROCARBON VAPORS

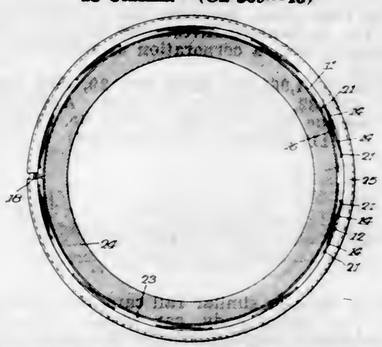
Paul M. Raigorodsky, Tulsa, Okla., assignor to Petroleum Engineering, Inc., Tulsa, Okla., a corporation of Delaware

Original No. 1,977,067, dated October 16, 1934, Serial No. 505,381, December 29, 1930. Application for reissue September 11, 1936, Serial No. 100,286

7 Claims. (Cl. 196—11)

7. The method of recovering desirable hydrocarbons from an original normally gaseous charge consisting mainly of normally gaseous constituents and containing said desirable hydrocarbons which consists in dividing said charge into a gaseous stream and a liquid stream by subjecting said charge to stage compression and cooling at progressively increasing pressures, with separation of condensate from the uncondensed portion of the charge between the stages except the final one, the finally uncondensed portion of said charge forming said gaseous stream and said condensate forming said liquid stream, introducing said liquid stream into a rectification zone, also introducing said gaseous stream directly into said zone, rectifying said streams in said zone into a stabilized fraction containing said

desirable hydrocarbons which is withdrawn from the lower portion of said zone and withdrawing the remainder of said charge from the upper portion thereof.



20,588

PISTON RING EXPANDER

Herman Teetor, Hagerstown, Ind., assignor to The Perfect Circle Company, Hagerstown, Ind., a corporation of Indiana

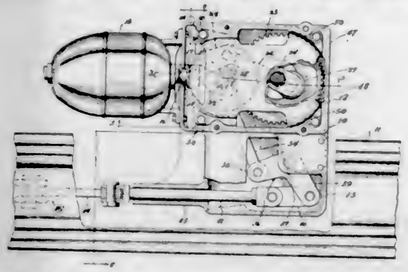
Original No. 2,025,334, dated December 24, 1935, Serial No. 23,477, May 25, 1935. Application for reissue October 21, 1937, Serial No. 170,243

13 Claims. (Cl. 309—43)

1. A one-piece spring steel piston ring expander comprising a supporting band, leaf portions in overlying substantially concentric relation to the supporting band, necks integral with one edge of said band and one edge of the leaf portions, and means spacing the leaf portions from the supporting band.

20,589

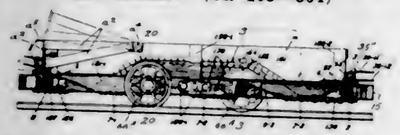
DRIVE MECHANISM FOR SHAKER CONVEYERS



William W. Sloane, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois

Original No. 2,026,103, dated December 31, 1935, Serial No. 644,666, November 28, 1932. Renewed June 3, 1935. Application for reissue November 1, 1937, Serial No. 172,296

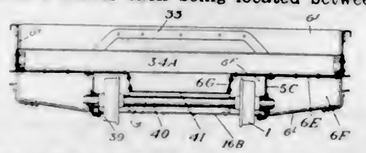
19 Claims. (Cl. 198—220)



2. In a shaker conveyer operating mechanism, the combination with a reciprocably driven conveyer trough, of a casing, a rotatable driving member mounted within said casing, two rocking members mounted within said casing for move-

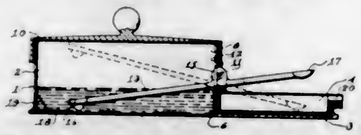
ment about parallel pivotal axes, an operative connection between said rotatable member and one of said rocking members, a driving connection between said other rocking member and said conveyer trough for reciprocably driving said conveyer trough, and a connecting member for connecting said devices together, said rocking

members being so proportioned and arranged with respect to said connecting member that their axes of pivotal movement are on opposite sides of the longitudinal center line of said connecting member and the motion of said connecting member from one end of the stroke to the other is a substantially parallel motion.



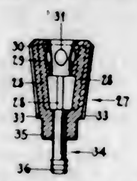
20,590
MINE AND OTHER CAR
Audley Hart Stow, deceased, late of Charleston, W. Va., by Sanford Investment Company, Wilmington, Del., a corporation of Delaware, assignee
Original No. 1,961,017, dated May 29, 1934, Serial No. 424,132, November 15, 1920. Application for reissue May 28, 1936, Serial No. 82,381
117 Claims. (Cl. 105—364)

48. In mine or similar rail cars, the combination of a lading body, car wheels, car axles, flanged metal longitudinal side sill-means which are located between opposite wheels and are of themselves sufficiently stiff to support the lading body without harmful end-drooping, and the said sill-means having upright portions located at least in part below the horizontal plane of the axes of the car wheels, a sub-axle lading bottom and axle boxings having upright longitudinal walls located at least in part in the lading space and inside the upright walls of oppositely disposed side sill-means and rigidly secured thereto.



20,591
SIDEWISE DUMPING MINE CAR AND THE LIKE
Audley Hart Stow, deceased, late of Charleston, W. Va., by Sanford Investment Co., assignee, Wilmington, Del., a corporation of Delaware
Original No. 1,961,019, dated May 29, 1934, Serial No. 707,911, April 21, 1924. Application for reissue May 28, 1936, Serial No. 82,382
71 Claims. (Cl. 105—364)

63. In a mine or similar rail car, the combination of means providing a lading body having upright side closure walls at the extreme outside of the lading body, longitudinal metal stiffening means for said lading body located between the upright planes of the said side closure walls and including side sills, members spaced from said side sills and having upright walls extending longitudinally of the lading body, car wheels and axles, said wheels each being located between a



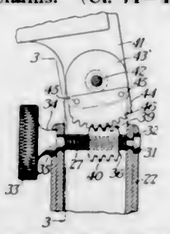
side sill and the said member adjacent such side sill, the plane of the wheel axes intersecting the side sills, axle guiding and supporting means located outside the corresponding wheels and rigidly attached to the lading body structure and effective for permitting the wheel to move downward when the car is passing over an uneven track.

20,592
ASHTRAY
Albert A. Vuccino, New York, N. Y.
Original No. 2,028,304, dated January 21, 1936, Serial No. 11,700, March 18, 1935. Application for reissue May 15, 1937, Serial No. 142,841
9 Claims. (Cl. 131—51)

1. In an ash tray and the like, means for holding a supply of liquid, and a swingable liquid-conveying member associated with said means, one end of said member being adapted to be normally submerged in said liquid while the other end is raised above the level of said liquid, whereby when said other end is depressed the liquid is caused to flow thereto.

20,593
FAUCET CONNECTION
Samuel L. Weiss, Brooklyn, N. Y.
Original No. 2,085,841, dated July 6, 1937, Serial No. 64,197, February 17, 1936. Application for reissue October 28, 1937, Serial No. 171,592
3 Claims. (Cl. 285—90)

3. In a detachable coupling for securely connecting a hose to a faucet, comprising a rubber body having an outer shell adapted at the lower end for connection to a hose, the upper end of said body having an inwardly extending annular flange, said flange having a downwardly extending sleeve spaced from said shell, and a plurality of longitudinal ribs connecting said sleeve and the inner surface of said outer shell in said spaced relation.



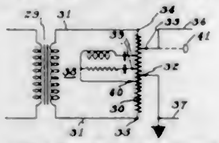
20,594
METHOD OF TREATING INVERT SYRUP, HONEY, AND THE LIKE
Robert S. Anthony, New York, N. Y.
No Drawing. Original No. 2,094,053, dated September 28, 1937, Serial No. 53,930, December 11, 1935. Application for reissue October 12, 1937, Serial No. 168,578
3 Claims. (Cl. 127—42)

1. The method of extracting levulose from substances containing invert sugar such as crystallized invert syrup and crystallized honey, comprising adding ethyl alcohol with the substance to the point where the ratio of alcohol to alcohol and water is of the order of 85% and the ratio of total solids to alcohol and water is of the order of 40%, thoroughly mixing them at a temperature of the order of 75 degrees F., causing the mixture to attain equilibrium, and separating the liquid phase therefrom.

PATENTS

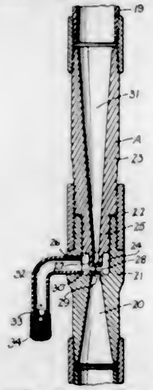
GRANTED DECEMBER 14, 1937

2,101,830
TILTING MECHANISM FOR PROJECTORS
David L. Babcock, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application March 5, 1937, Serial No. 129,259
10 Claims. (Cl. 74—424.8)



1. A tilting mechanism comprising a base member, having a channel, a driving screw journaled in said base member, and extending through said channel, a rack member threaded on said driving screw, said rack member engaging the walls of the channel in said base member whereby it is prevented from rotation relative to the base member but is compelled to slide along the driving screw when said screw is rotated, a mechanism to be tilted pivotally mounted on said base member, and an arcuate toothed segment fixed to the pivoted end of the mechanism and extending into the channel to be in engagement with the rack member, whereby a sliding of the rack member relative to the base member effects a tilting of the mechanism relative to the base member.

2,101,831
SULPHATED SELACHYL ALCOHOL
Alfred William Baldwin and Hugh Mills Bunbury, Blackley, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application January 23, 1935, Serial No. 3,198. In Great Britain February 9, 1932
6 Claims. (Cl. 260—99.12)

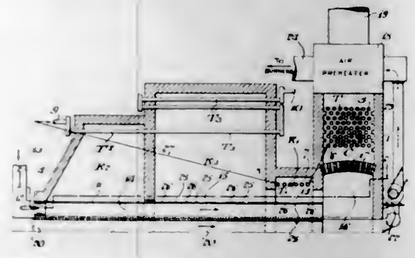


5. A sulphuric ester of selachyl alcohol.

2,101,832
VOLUME CONTROL CIRCUITS
Loy E. Barton, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 12, 1934, Serial No. 725,272
20 Claims. (Cl. 178—44)

14. In an audio frequency volume control system, a control device including a shunt impedance element, at least one frequency discriminating signal attenuating means connected directly in shunt to a fixed portion of said element, and means providing two independently variable output connections with said element, the one including and the other excluding, said fixed portion.

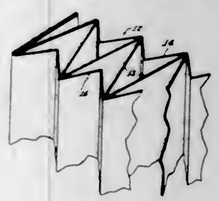
2,101,833
FLUID OPERATED PUMP
Sidney Q. Bates, Houston, Tex.
Application June 23, 1934, Serial No. 732,112
3 Claims. (Cl. 103—260)



1. An eduction tube for wells, a Venturi passage therein having an upstream inwardly tapering portion, a shoulder at the inner end of said tapered portion, a constricted orifice adjacent thereto, a cylindrical constriction downstream from said orifice, a chamber surrounding said constriction, said orifice being spaced from said cylindrical constriction to form a gap in said passage communicating with said chamber, a flaring end to said passage downstream from said constriction, and an inlet to said chamber.

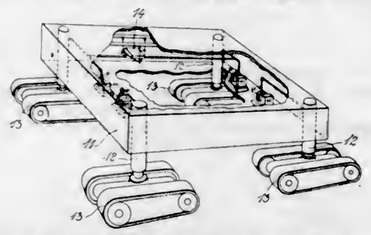
2,101,834
COMPOSITIONS OF MATTER FOR PHOTOGRAPHIC PROCESSING BATHS
Fred R. Bean, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application January 29, 1936, Serial No. 61,428
3 Claims. (Cl. 95—88)

1. A dry mixture of chemicals, suitable for preparing an acid hardening fixing bath by dissolving in water, comprising sodium thiosulfate, potassium alum, and, as an essential acidifying component, an anhydrous acid sodium acetate.



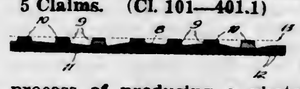
2,101,835
HEAT TRANSFER SYSTEM
James S. Alcorn, Wynnewood, Pa., assignor to Alcorn Combustion Company, Philadelphia, Pa., a corporation of Delaware
Application March 12, 1928, Serial No. 260,956
Renewed February 3, 1936
29 Claims. (Cl. 196—47)

10. A heat transfer system comprising separate heating chambers, banks of bare heat absorption tubes disposed respectively in said chambers, a combustion system having walls disposed in said chambers and constituting sources of heat radiated directly therefrom to said tubes, the source of radiant heat in one of said chambers occupying a portion thereof having a greater length than that portion of the said chamber occupied by the tubes therein, whereby radiation of heat to said tubes is effected at high rate per unit of area of said tubes per unit of time, and means for reducing the rate of radiation of heat to the tubes in another of said chambers comprising division of the radiating wall structure in said other of said chambers into components having different heat radiating effects.



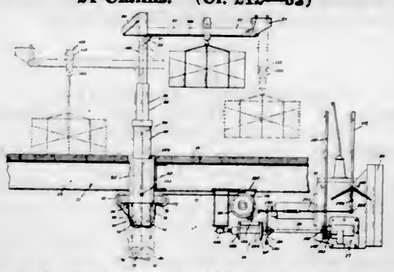
23. A heat transfer system comprising separate heating chambers, banks of heat absorption tubes disposed respectively in said chambers, a radiation combustion chamber common to said heating chambers having wall structure radiating heat to the tube banks in said heating chambers, the cross section of said radiation combustion chamber being less in one of said heating chambers than in the preceding heating chamber, and means for interconnecting said tube banks for passage of fluid therethrough in succession.

2,101,836
THERMAL INSULATING BUILDING UNIT
Edward L. Benedict, New York, N. Y., assignor to Elb Products, Inc., New York, N. Y., a corporation of New York
Application October 21, 1936, Serial No. 106,709
7 Claims. (Cl. 154—45)



1. A thermal insulating unit comprising an accordion-plaited-like foundation having the ability to be expanded and contracted laterally and comprising a series of slat-like portions connected together so that on expansion or contraction a hinge-like movement occurs at the connections of said slat-like portions, and a heat reflective metal accordion-plaited-like covering for said foundation on at least one side thereof, said covering also including slat-like portions of less width than those of the foundation and attached by hinge-like connections to said foundation at at least some of said hinge-like portions thereof on at least one side.

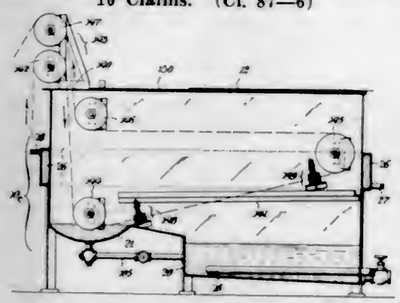
2,101,837
LEVELING DEVICE
Luther E. Blanchett, South Milwaukee, Wis., assignor to Bucyrus-Erie Company, South Milwaukee, Wis., a corporation of Delaware
Application May 13, 1936, Serial No. 79,594
19 Claims. (Cl. 200—52)



1. In a control for a leveling device, the combination of: two level-responsive control means, each responsive to change of level in a vertical plane at right angles to that of the other; and means suspending the above-described apparatus from the device to be leveled, so as to permit shifting in all directions in parallel relation thereto.

2,101,838
PRINTING CUT
Joseph T. Cochran, Chicago, Ill.
Application October 28, 1935, Serial No. 46,979
5 Claims. (Cl. 101—401.1)

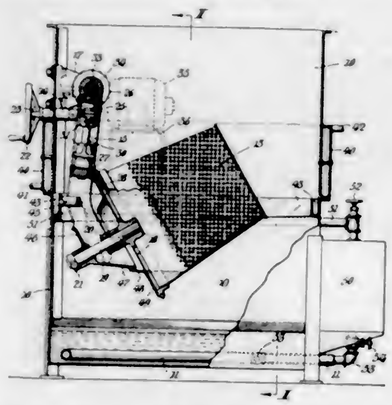
1. The process of producing a photographic printing plate from a thin flexible positive film coated with a sensitized gelatine emulsion which comprises the photographic formation of relief printing surfaces of high-light and shadow dots of varying heights on said film, in accentuating the height variation of the dots, and in applying a resilient backing to the film which will permit the latter to yield for bringing the printing surfaces of the dots into alignment when printing pressure is applied to the backing.



2,101,839
POWER HOIST
Beatty M. Crawford, Santa Ana, Calif.
Application November 5, 1935, Serial No. 48,328
24 Claims. (Cl. 212—63)

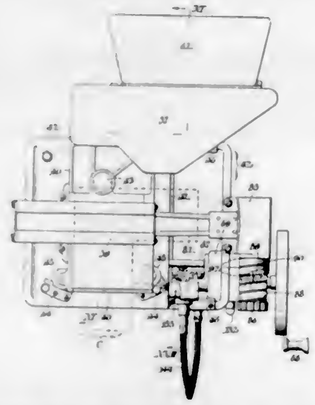
1. In a hoist, a boom having a track, a cable extending longitudinally of the boom adjacent the track, a guide means at the outer end of the boom for the cable to guide the cable upwardly, a supporting structure adjacent the end of the boom for the end of the cable, a load carrier having a wheel for running on the track and a

pulley for engaging the cable, a releasable winding means for the cable operative whereby a load may be supported beyond the end of the boom by a double drop of the cable engaging the pulley and by winding in the cable the load is raised and automatically transferred from the cable to the track of the boom.



2,101,840
DEGREASING APPARATUS
Clarence F. Dinley, Detroit, Mich., assignor to James H. Bell, Philadelphia, Pa.
Application January 15, 1935, Serial No. 1,898
10 Claims. (Cl. 87—6)

1. Apparatus of the character described, for treating articles or work with volatile solvent whose vapor is heavier than air, comprising in combination a treating vessel or enclosure adapted to contain volatile liquid solvent and its vapor, and apertured and open for the introduction and withdrawal of work directly into and from its upper portion at one side thereof only, but otherwise covered over and substantially closed, so as to prevent drafts into and out of the vessel while at the same time permitting introduction and withdrawal of work at the work opening above referred to; cooling means for maintaining in the vessel a cool vapor-drawing condensing zone at a level substantially below its work opening above referred to, so that the closed-in portion of the vessel above said level affords a draft-free region in which work cleaned with the solvent below said level may be dried before withdrawal from the vessel, without resulting loss of solvent vapor through the opening; and an endless conveyor traveling a course from the opening above referred to down below said condensing zone, and also through said drying region and back to the work opening.

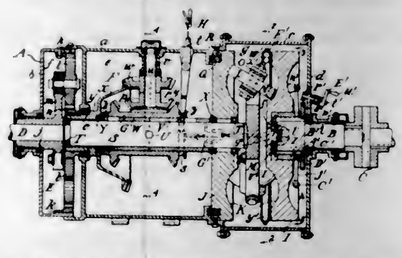


2,101,841
DEGREASING APPARATUS
Clarence F. Dinley, Detroit, Mich., assignor to James H. Bell, Philadelphia, Pa.
Application February 7, 1935, Serial No. 5,385
8 Claims. (Cl. 87—6)

1. Apparatus of the character described, for tumbling and treating objects with volatile solvent whose vapor is heavier than air, comprising in combination an air-excluding treating vessel, for containing liquid solvent and its vapor, open at its upper portion; an arm swingable down and up, and a tumbling barrel revolubly mounted on said arm and swinging therewith down and up into and out of the vessel; means for driving said tumbling barrel when swung down into the vessel; means for retaining and condensing solvent vapor evolved in the vessel, and thus preventing its overflow therefrom; and means for delivering the condensate to the work in the revolving vessel, including a collecting trough on the vessel wall,

and a conduit on said arm receiving the condensate from said trough and discharging it into the vessel upon the work therein.

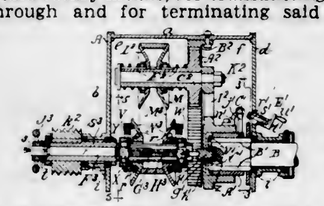
2,101,842
MOTION PICTURES AND APPARATUS THEREFOR
Charles Etzel, Philadelphia, Pa., assignor, by mesne assignments, to Etzo Corporation, a corporation of California
Application March 23, 1934, Serial No. 716,929
18 Claims. (Cl. 88—16.6)



1. A method of taking motion pictures affording the effect of three dimensions, which method comprises deflecting the path of light from the scene or subject being photographed to the camera, shifting the camera to and fro transversely over a stereoscopic binocular range, compensatively swinging the camera about an axis at its lens tube to keep its line of vision directed toward the same object in the scene, and concurrently varying the deflection of the light path so as to keep its length substantially constant, notwithstanding the other changes.

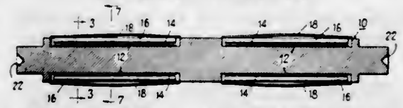
2,101,843
DRY MAKE-UP COSMETIC IN SOLID CAKE FORM
Frank Factor and Paul E. Fisher, Los Angeles, Calif., assignors to Max Factor & Co., Los Angeles, Calif., a corporation of Delaware
No Drawing. Application November 27, 1936, Serial No. 112,996
7 Claims. (Cl. 167—91)

4. A colored make-up cosmetic in substantially dry, solid cake form containing from about 70% to 97% by weight of colors, pigments and fillers, 1% to 26% by weight of oils and waxes and 1% to 13% by weight of water-soluble dispersing agents.



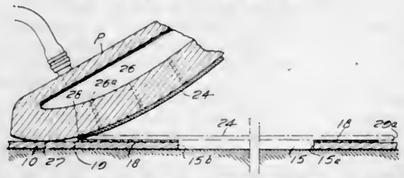
2,101,844
SPEED REDUCER AND OTHER TRANSMISSION
George Holt Fraser, Brooklyn, N. Y.
Application August 9, 1935, Serial No. 35,500
20 Claims. (Cl. 74—281)

1. In rotation transmissions comprising, rotary drive means, for the rotatable transmission of torque and rotary motion, rotary driven means, rotatable from and relatively to said drive means during said transmission, for the rotatable transmission of torque and rotary motion therefrom, speed change means in operative relation to said rotary means, rotatable from said drive means and being operable to transmit torque and rotation at changed speed therefrom to said driven means during said transmission, and drive connection means in operative relation to said rotary means and to said speed change means, for effecting said transmission; the combination therewith of torque responsive torque termination means in operative relation to one of said rotary means and to said speed change means, for transmitting and for terminating said transmission of torque therethrough, designed to transmit a normal torque load, being operable during said normal torque load to transmit torque through said rotary means and said speed change means, and being operable upon overload to terminate said transmission of said torque therethrough, and being operable to terminate said changed speed rotation transmission upon said overload.



2,101,845
SPEED REDUCER AND OTHER TRANSMISSION
George Holt Fraser, Brooklyn, N. Y.
Application August 9, 1935, Serial No. 35,501
20 Claims. (Cl. 74—280)

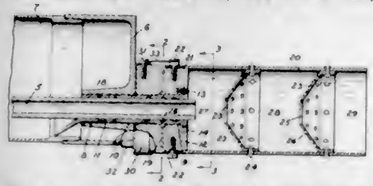
1. In rotation transmissions comprising, rotary drive means, for the rotatable transmission of torque and rotary motion, rotary driven means, rotatable from and relatively to said drive means during said transmission, for the rotatable transmission of torque and rotary motion therefrom, and yieldable drive connection means in operative relation to said rotary means, for yieldably transmitting torque and rotary motion therebetween, designed to, during said transmission, yieldably transmit a relatively major torque load and variable rotary motion therebetween; the combination therewith of torque responsive torque termination means in operative relation to said yieldable drive connection means and to one of said rotary means, for transmitting torque therethrough and for terminating said trans-



mission of torque, designed to transmit a normal torque load, being operable to transmit torque therethrough during said normal torque load, and being operable upon overload of said torque responsive torque termination means to terminate said transmission of torque and said yieldable transmission of said major torque load, and being operable to terminate said yieldable transmission of variable rotary motion upon said overload.

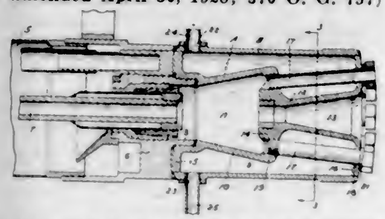
2,101,846
SELF-GRIPPING MANDREL
Elmer O. Goordman, New York, N. Y.
Application December 1, 1936, Serial No. 113,597
5 Claims. (Cl. 82—44)

1. A work-holding mandrel having a pair of portions provided with longitudinal grooves, rollers in said grooves and springs for forcing the rollers of the respective portions outwardly about the axis of said mandrel, said rollers being free to roll in either direction on said springs beyond the longitudinal centers of said grooves.



2,101,847
PATCH UNITING METHOD FOR ENVELOPES
Robert L. Gray, Brooklyn, N. Y.
Application June 14, 1933, Serial No. 675,689
9 Claims. (Cl. 93—61)

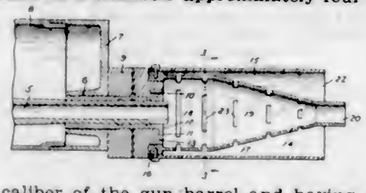
1. The method of forming window envelopes from a predeterminedly formed envelope blank including a cutout and a patch comprising a substantially transparent sheeting of predetermined contour, the steps which comprise providing the envelope blank with an application of a normally fluid adhesive, outlining an area substantially less than that outlined by the patch, registering the edge of the patch with the application of adhesive adjacent the filling side of the envelope and then pressing the patch and envelope blank



to each other while displacing the adhesive away from the point of registry of the patch and the application of the adhesive.

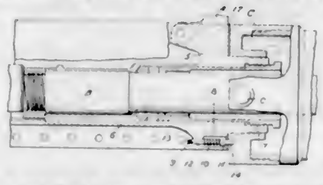
2,101,848
STABILIZER FOR GUNS
Samuel G. Green, Gray, Ga.
Application October 16, 1936, Serial No. 105,950
2 Claims. (Cl. 89—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a gun, a jacket having a front plate with an opening, a bearing mounted in the opening and extending in front of the front plate, said bearing having radial vents, a reciprocable gun barrel mounted in the bearing and normally covering the vents therein, a block mounted on the bearing and having vents in communication with the vents of the bearing and leading to atmosphere, and a casing carried by the block for receiving the gases of discharge of the gun.



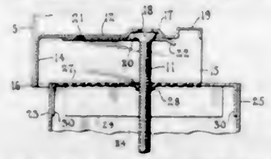
2,101,849
MUZZLE ATTACHMENT FOR GUNS
Samuel G. Green, Gray, Ga.
Application October 29, 1936, Serial No. 108,221
4 Claims. (Cl. 89—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A muzzle attachment for a gun comprising an inner casing for receiving the gases of discharge of the gun and having a rear body part and a front neck part connected thereto by a shoulder, flanges on the body and neck parts, an outer casing mounted on the flanges and cooperating with the inner casing to establish a chamber for receiving a cooling fluid, a fluid inlet in the outer casing, a fluid outlet in the outer casing, a plurality of flues inserted through the flange of the neck disposed in the fluid chamber and threaded in the shoulder, said flues projecting from the flange of the neck, a gasket on the projecting end of each flue and a nut holding each gasket against the flange.



2,101,850
MUZZLE ATTACHMENT FOR GUNS
Samuel G. Green, Gray, Ga.
Application October 29, 1936, Serial No. 108,222
1 Claim. (Cl. 89—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

In combination, a gun barrel, an attachment at the muzzle of the barrel comprising an imperforate outer tube, an inner tube connected at its rear end to the outer tube and spaced therefrom to provide an annular expansion chamber, said inner tube having at its rear a short expansion chamber of a diameter approximately four times

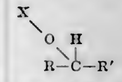


the caliber of the gun barrel and having at its front a tapered recompression chamber approximately twice the length of the rear expansion chamber, and said inner tube having a plurality of apertures decreasing in size from rear to front.

2,101,851
MACHINE GUN JACKET MOUNTING
Samuel G. Green, Gray, Ga.
Application November 20, 1936, Serial No. 111,868
2 Claims. (Cl. 89—2)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

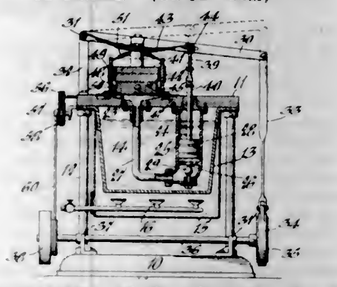
1. In a machine gun, a block having a projecting tubular part with external threads, a jacket having unmatched threads engaging the threads of the tubular part, trunnions on the jacket, said jacket provided with a recess having a predetermined positional relation with respect to the trunnion, a plunger carried by the block and engaging the recess of the jacket to lock it against rotation with the trunnions in correct final assembly positions, and a shim between the end of the jacket and the block, said shim having a thickness determined by test assembly to compensate for clearance due to the use of unmatched threads on the jacket.

2,101,852
ADJUSTABLE FIXTURE SUPPORT
Samuel Hammer, Brooklyn, N. Y., assignor to United Metal Box Co., Inc., New York, N. Y., a corporation of New York
Application December 20, 1935, Serial No. 55,343
5 Claims. (Cl. 45—139)



2. A fixture support for cabinets and the like comprising two elongated box-like members, one fitting within the other and serving as a base member and the other adapted to be secured to and directly support a fixture, said members having thread means at each end thereof and being

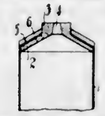
adapted for vertical movement relative to each other, a headed adjusting screw threaded into each thread means with its head extending upwardly upon which head the fixture supporting member rests and spring means for detachably connecting the head to said fixture supporting member whereby said means and adjusting screws detachably connect said members together for the adjustment thereof.



2,101,853
COMPOSITION OF MATTER AND METHOD AND STEPS OF MAKING AND USING THE SAME
Mortimer T. Harvey, East Orange, N. J., assignor to The Harvel Corporation, a corporation of New Jersey
No Drawing. Application April 24, 1934, Serial No. 722,145
6 Claims. (Cl. 260—3)

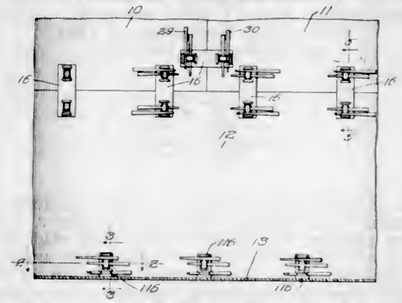
6. The method of making an oil soluble resinous product which comprises reacting, under the influence of ammonia as a catalyst, an aldehyde with an ether having the following representative formula:

where X and the oxygen atom, O, together represent a phenolic radicle and R and R' represent hydrocarbon radicles.



2,101,854
METHOD OF AND APPARATUS FOR COATING SUBSTANCES WITH METALS OR ALLOYS
Charles F. Haunz, Buffalo, N. Y.
Application January 15, 1932, Serial No. 586,861
31 Claims. (Cl. 91—12.2)

1. An apparatus of the character described, comprising a cylinder adapted for communication with a source of coating material and having a discharge, a nozzle connected with said cylinder-discharge and over which the element to be coated is placed, a piston operable in said cylinder for forcing the coating material against that portion of the element disposed over the nozzle, means for holding the element against said nozzle during the operative stroke of the piston, and opposing contractible jaws applied to the face of the nozzle and engagable with the side edges of the element for creating a fluid-tight joint therewith.

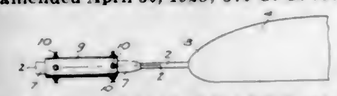


6. In the process of impregnating wood with metal, the step of momentarily impacting, with a pressure considerably greater than atmospheric, a substantial body of the metal in a fluid condition and as a unit against a face of said wood, to cause the metal to penetrate the pores of the wood before congealing.

2,101,855
CONTAINER
Douglas Henderson, Toronto, Ontario, Canada
Application August 17, 1936, Serial No. 96,393
10 Claims. (Cl. 221—60)

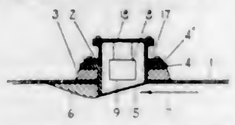
1. In a container the combination of a body formed of metal tubing and having an annular inwardly directed flange at its outlet end; and a top of rigid non-metallic material for said outlet end, said top comprising a pair of members between which said flange is clamped, said members having a frictional engagement one with the other.

2,101,856
WELDING APPARATUS
Clarence W. Hines, Chicago, Ill., assignor to Chicago Bridge & Iron Company, Chicago, Ill., a corporation of Illinois
Application July 31, 1936, Serial No. 93,699
4 Claims. (Cl. 113—99)



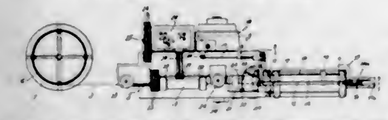
1. Welding apparatus, including: a plate apertured to receive apertured holding lugs on members to be welded together, wedges adapted to be driven through the apertures in the holding lugs to draw the members against the plate; a shoulder on the plate adjacent an aperture in it; and a wedge adapted to be driven between a holding lug and the shoulder to shift the member laterally with respect to the plate.

2,101,857
MANUFACTURE OF MOTOR FUELS
Vladimir Ipatieff and Raymond E. Schaad, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application April 23, 1936, Serial No. 76,076
16 Claims. (Cl. 196—10)



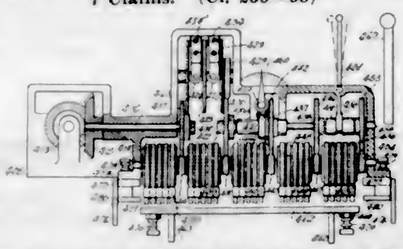
9. A process for producing normally liquid hydrocarbons from a hydrocarbon mixture containing butenes and propylene, which comprises subjecting the mixture to polymerization in the presence of solid phosphoric acid catalyst in a plurality of stages, the first stage being at a butene polymerizing temperature and under sufficient pressure to maintain a substantial portion of the butenes in liquid phase, and a subsequent stage being at a propylene polymerizing temperature higher than that in the first stage and under a pressure such as to maintain the propylene in vapor phase.

2,101,858
STATIC TUBE SLEEVE
Andrew W. Knisley, Dayton, Ohio
Application July 30, 1936, Serial No. 93,463
5 Claims. (Cl. 73—2)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. In an airspeed head of the Pitot-static tube type including a static tube having a closed end and a static opening in its side wall, an open ended air conduit along the outer surface of the static tube and extending over the static opening, said conduit being dimensioned to conduct a layer of air in a straight flow close to and parallel with the outer surface of the static tube and across the static opening.

2,101,859
MEANS FOR MOUNTING SUBMARINE SIGNALING APPARATUS
Willy Kunze, Bremen, Germany, assignor to Atlas Werke Aktiengesellschaft, Bremen, Germany
Application June 15, 1936, Serial No. 85,228
In Germany September 26, 1935
5 Claims. (Cl. 181—0.5)



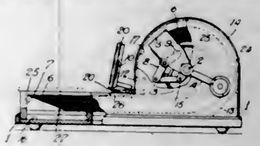
1. In combination with the skin of a vessel, a submarine signaling apparatus having a radiating element and means positioning said radiating element in the skin of the vessel at an angle of inclination to the forward direction of the vessel whereby the water pressure on the radiating surface will be increased when the ship is moving.

2,101,860
WIRE CUTTING MACHINE
Marvin W. Lewis, Cleveland Heights, and Carl B. Jones, East Cleveland, Ohio, assignors to The Lewis Machine Company, Cleveland, Ohio, a corporation of Ohio
Application March 12, 1936, Serial No. 68,390
11 Claims. (Cl. 140—140)

1. In a machine of the class described, means for feeding a wire along a path, a cutting head reciprocable along a portion of said path, wire cutting means carried by said head, a rotatable shaft, an eccentric and a cam rotatable with said shaft, an operative connection between said eccentric and said head for reciprocating the latter whereby a stroke of said head corresponds to movement of said eccentric between dead centers, and an operative connection between said cam and cutting means for actuating the latter, said cam and connection being arranged to start actuation of said cutting means upon movement of said eccentric substantially sixty degrees from one of its dead centers.

2,101,861
CALCULATING AND RECORDING SYSTEM
Matthew H. Loughridge, Bogota, N. J.
Application May 10, 1932, Serial No. 610,879
7 Claims. (Cl. 235—58)

1. A counter-poise for a scale having a beam with a rack bar, said poise mounted to move on the beam of the scale until a position of balance is reached and comprising a pinion in the counter-poise engaging said rack, a shaft connected with the pinion, a gear connected with the shaft and a first totalizing device connected with the gear, a multiplying device connected with said shaft and a second totalizing device connected with said multiplying device, said totalizing devices comprising a plurality of rotating members.



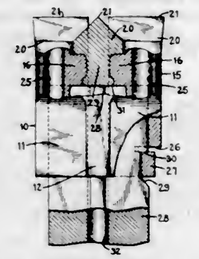
2,101,862
GAS-OPERATED GUN
Stephen H. MacGregor, Savannah, Ga.
Application April 22, 1936, Serial No. 75,732
3 Claims. (Cl. 42—3)
(Granted under the Act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a gun, a receiver, a barrel fixed to the receiver, a breech bolt reciprocable in the receiver, means whereby the bolt is locked to the receiver, a cylinder fixed to the barrel, a gas passage between the barrel and cylinder, a piston in the cylinder, a collar on the rear end of the piston and engageable with the cylinder to limit forward movement of the piston, an offset finger extending rearwardly from the piston, a bolt-operating rod having its front part slidable within the piston and adapted to be engaged and moved rearwardly by the piston, a spring seat in the rod, a driving spring for the rod, a spring between the spring seat of the rod and the front end of the piston, a collar fixed on the rod and movable between the end of the piston and the end of the finger of the piston, a latch releasably engaging the rod to hold it against rearward movement, said latch positioned so as to be tripped by the finger of the piston.

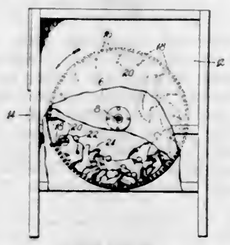
2,101,863
SHEET PAPER CABINET
Stephen Magami, Nanaimo, British Columbia, Canada
Application February 7, 1936, Serial No. 62,774
1 Claim. (Cl. 312—50)

A sheet-paper cabinet or container comprising a rectangular base, with sides attached, the rear portion of the sides being raised in semi-circular shape to conform to a stack of sheet-paper adapted to be coiled at the rear end within the cabinet and with the front end of the sides being raised sufficiently to enclose said stack of sheet-paper lying flat; a transparent covering extending from the base at the rear end over the semi-circular portion of the sides; a hinged lid in two sections covering the front lower portion of the cabinet; a shaft rotatably mounted through the centre of the raised rear ends of the sides and extending through one side and having a handle attached on the outside of the cabinet; a tray or sheet-paper holder designed to receive the ends of a stack of sheet-paper, the ends of said tray being extended and connected loosely to said shaft and free to rotate around said shaft within the cabinet; paper-gripping levers pivoted on said tray and connected by links to levers

rigidly attached to said shaft and operable by said handle to hold sheets securely in said tray; a disc loosely mounted on said shaft centrally of the width of the cabinet; laterally spaced felt-covered wedge-shaped pieces attached to said base in the front portion of the cabinet; whereby a stack of sheets may have an end thereof inserted in the tray, the handle rotated to cause the gripping levers to secure the stack to the tray and rotate the tray to coil the gripped end of the stack around the disc and arrange the free edges of the sheets of the stack in inclined position on said wedge-shaped pieces, and rotated in the opposite direction to release the stack from the tray so that the sheets may be withdrawn one by one from the cabinet.



2,101,864
ROCK DRILL
William J. McCallum, Islington, Ontario, Canada
Application March 27, 1936, Serial No. 71,084
16 Claims. (Cl. 255—64)



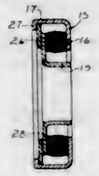
1. A rock drill bit comprising a retainer having seats for the reception of separate nibs, a plurality of nibs in said seats, and a washer element within said retainer beneath said nibs, said retainer and washer element being formed of ductile material and having portions pressed into interengagement with said nibs for firmly uniting the parts into a permanent unitary structure.

2,101,865
ROCK DRILL
William J. McCallum, Islington, Ontario, Canada
Application February 18, 1935, Serial No. 6,942
4 Claims. (Cl. 255—64)

1. In a device of the class described a drill rod having a polygonal outer contour, a detachable bit having a socket portion with an opening of corresponding polygonal cross section adapted to snugly fit the end of said rod and be applied thereto by a rectilinear sliding movement, said socket portion being formed of ductile material, cutting elements of hard, wear-resistant material firmly and permanently united with said socket portion, and inter-engaging shoulders carried directly by said rod and socket portion for retaining said parts in assembled relation, one of said shoulders being shiftable relative to the member by which it is carried into interengagement with the other shoulder, both of said shoulders then being rigidly and unyieldingly held in interengaging relation.

2,101,866
MEANS AND METHOD FOR SOFTENING HIDES AND SKINS
Matthew M. Merritt, Middleton, Mass., assignor to The Tanning Process Company, Boston, Mass., a corporation of Massachusetts
Application March 18, 1935, Serial No. 11,538
9 Claims. (Cl. 149—6)

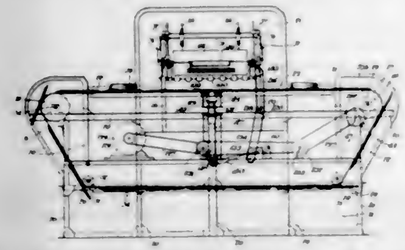
4. That improvement in methods of softening dry or substantially dry tanned hides or skins which comprises tumbling the hides or skins while in a crumpled condition in a rotary container having its dimension along its axis of rotation substantially less than the shortest overall dimension of the hides or skins undergoing treatment, thereby maintaining the hides or skins in folded or crumpled condition while they are tumbling in said container, and continuing tumbling of the hides or skins until all portions thereof have been softened by repeated flexing.



2,101,867
MANUFACTURE OF WATER-SOLUBLE, STORAGE-STABLE ACETYLSALICYLIC ACID PRODUCTS
Clemmy O. Miller and Arthur E. Siehrs, Chicago, Ill.
No Drawing. Application August 18, 1934, Serial No. 740,387
25 Claims. (Cl. 167—65)

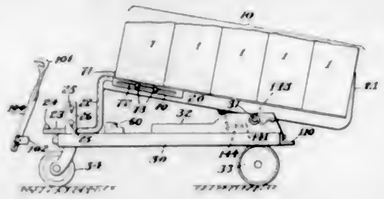
1. As a composition of matter, a mixture of a member of the group consisting of acetylsalicylic acid and its metal salts and a member of the group consisting of amino acids and their metal salts.

2,101,868
PROCESS OF MANUFACTURING ACETIC ANHYDRIDE
Martin Mugdan and Johann Sixt, Munich, Germany, assignors to Consortium für Elektrochemische Industrie, G. m. b. H., Munich, Bavaria, Germany, a corporation of Germany
No Drawing. Application October 22, 1934, Serial No. 749,484. In Germany November 28, 1933
14 Claims. (Cl. 260—123)



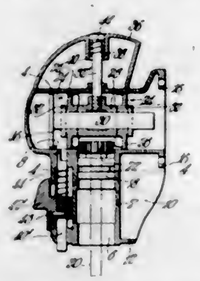
1. A process for producing acetic anhydride which comprises heating acetic acid containing a small amount of a phosphorus-containing substance, gaseous at the reaction temperature, and condensing acetic anhydride-containing products, from the aforementioned heating, in the presence of a voltaile basic nitrogen compound.

2,101,869
VIBRATION REDUCING MEANS
Warren Noble, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application November 27, 1934, Serial No. 755,011
14 Claims. (Cl. 121—36)



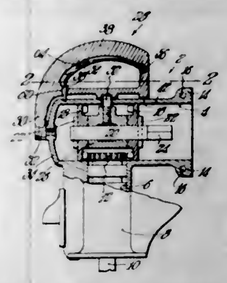
1. In a vibration reducing unit, coaxial annuli relatively movable into positions of non-coaxial relation and having inner and outer annular peripheral surfaces respectively engageable with a part to be vibrated and a part to be protected from shock, and a rubber annulus having its opposite faces bonded in shear to said annuli for yieldingly opposing relative movement of said annuli into said positions of non-coaxial relation.

2,101,870
MACHINE FOR ENVELOPING ARTICLES
Joseph N. Pattison, Jr., Philadelphia, Pa.
Application March 21, 1935, Serial No. 12,181
20 Claims (Cl. 93—2)



1. An article wrapping machine comprising a movable article conveying device, means for supplying with the advance of the conveying device wrapping material above the article to be wrapped, means for moving said article upwardly from said conveying device, means for directing said wrapping material downwardly around the article upon upward movement of the article, means for bringing portions of said wrapping material together under the bottom of said article while the same is elevated, and sealing means movable vertically for securing the said wrapping material under the bottom of said article.

2,101,871
APPARATUS FOR MOVING AND STACKING HEAVY CARGO UNITS
William Ray Pease, South Portland, Maine
Application September 26, 1935, Serial No. 42,272
3 Claims. (Cl. 254—3)



1. Load handling and stacking equipment for use with a wheeled truck having a fixed fulcrum adjacent its rear end, comprising a load-carrying frame, freely detachable fulcrum engaging means detachably engageable with the fulcrum of the truck and so disposed to the rear end of the frame as to support the frame on the truck in clearing relation to the rear end of the truck when the loaded frame is toppled on its fulcrum, and downwardly extending means adjacent the forward end of the frame coacting with the truck body for normally supporting said frame in downwardly and rearwardly inclined position on the truck body with the rear end of the frame overhanging the rear end of the truck body and with the center of gravity of the load slightly in advance of said fulcrum, said last named means constituting a handle element by means of which the forward end of the frame may be raised to a height sufficient to shift the center of gravity of the load rearwardly to a point at which the frame disengages itself from the fulcrum and the load falls clear of the truck into an upended position of discharge.

2,101,872
WRINGER HEAD
Julian L. Perkins, West Springfield, Mass.
Application March 5, 1936, Serial No. 67,334
2 Claims. (Cl. 68—32)

1. A wringer head comprising in combination, a casing for rotatably resting in a column, a lock member reciprocable on said casing between locking and non-locking positions having a part for engaging and releasably locking said casing against rotative movement on a column, a driving element, a pair of driven members shiftable between a neutral inoperative position and an operative position in engagement with said driving element, means associated with said driven elements movable therewith to prevent movement of the locking member from locking position when a driven member is in engagement with the driving member, an operating member for shifting said driven members, a connection between the operating member and driven members, the casing provided with a slot receiving the connections, and spring means associated with the operating member and connections urging the operating member against the casing.

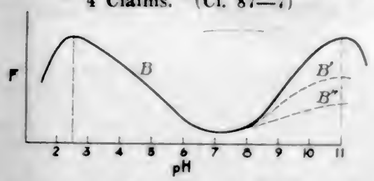
2,101,873
WRINGER HEAD
Julian L. Perkins, West Springfield, Mass.
Application May 18, 1936, Serial No. 80,238
3 Claims. (Cl. 74—337.5)

1. A head for a wringer or the like comprising in combination, a housing, engageable driving and driven members therein, a shifter for said members movable in the housing, a swinging operating member pivoted at one end to said housing and having a forwardly extending part overlying said housing, the housing being provided with a cam surface, the said forwardly extending part provided with a cam surface, a part associated with said shifter disposed to be acted upon by said cam surfaces, all adapted and arranged whereby the swinging of the operating member brings about movements of said shifter, and locking means carried by said operating member to releasably lock the member against movement.

2,101,874
COMPOSITE FABRIC
William Wallace Rowe, Cincinnati, Ohio, assignor to The Paper Service Company, Lockland, Ohio, a corporation of Ohio
Application March 8, 1934, Serial No. 714,647
12 Claims. (Cl. 154—50)

7. A composite fabric comprising at least two layers of paper and a plurality of layers of cementitious substances located therebetween, one of said layers of cementitious substance being a layer of rubber derived from latex, and at least one other of said layers of cementitious substance being a layer of bituminous material, said layer of bituminous material lying between a paper face of said composite fabric and said layer of rubber derived from latex.

2,101,875
PESSARY APPLICATOR
Lawrence Schleicher, Los Angeles, Calif.
Application October 25, 1935, Serial No. 46,797
10 Claims. (Cl. 128—127)



1. An instrument of the class described having means insertable into the vagina and provided with a grooved surface against which an edge wall of a pessary at the open side of the latter can be received and held; and a latch mechanism including a part disposed opposite the grooved surface to receive and hold a diametrically opposite edge wall of the pessary and co-operable with the grooved surface to maintain the pessary stressed lengthwise of the instrument and a part contactible with the cervix and co-operable with the first mentioned part to enable the pessary to be released from the instrument and thereby move by its own resiliency in a direction to cover the cervix.

2,101,876
COMPOSITE FILM AND METHOD OF MAKING
Clyde Scott, Newark, N. J.
No Drawing. Application April 14, 1933
Serial No. 666,211
30 Claims. (Cl. 18—59)

1. In a process of making by casting and evaporating method heat-and-pressure sensitive composite films of predetermined thickness adapted for welding and wrapping purposes steps that comprise depositing a thin layer of film forming solution comprising a cellulose ester uniformly on a smooth casting surface to form a lamina so thin as to be incapable of removal therefrom in the ordinary manner when dry, depositing thereon a thin layer of film forming solution comprising a thermoplastic heat-and-pressure sensitive adhesive composition to form a translucid attached coextensive lamina so thin as to be incapable of supporting itself by its own strength when dry, evaporating volatile solvent therefrom and then removing the composite film so formed from said casting surface.

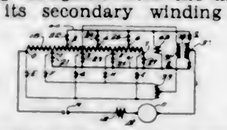
4. In the process of making by casting and evaporating method heat-and-pressure sensitive water repellent and moisture-vapor repellent composite film adapted for welding or wrapping purposes, steps comprising depositing a layer of film forming solution comprising cellulose acetate dissolved in volatile solvent uniformly on a smooth casting surface to form a base layer so thin as to be incapable of removal therefrom in the ordinary manner when dry, evaporating volatile solvent therefrom, depositing thereon a layer of film forming solution comprising a water repellent and moisture-vapor repellent thermo-adhesive compound dissolved in suitable volatile solvent, said compound comprising wax and two or more resins including polymerized vinyl ester, to form an attached coextensive heat-and-pressure sensitive layer so thin as to be incapable of supporting itself by its own strength when dry, evaporating volatile solvent, removing the film so formed from said casting surface and applying to one or both sides thereof a solution of compound comprising one or more non-absorbent substances resistant to mild acids, alkalis and the like, said compound comprising wax.

2,101,877
PROCESS FOR PREPARING PHOTOGRAPHIC GELATIN
Samuel E. Sheppard and James H. Hudson, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
Application September 6, 1935, Serial No. 39,455
4 Claims. (Cl. 87—7)

1. A process of preparing photographic gelatin having a minimum region of colloidal properties, such as swelling in water and change in viscosity in alkaline solution, at pH 7 and upward, which comprises steeping, unhairing, and plumping hides in about a ½ to 2% solution of the weakly ionized acid, neutralizing the hides to a pH of about 6 to 7, and extracting the gelatin from them in water solution.

2,101,878
MECHANICAL HAMMER
Benjamin W. Snodgrass, Denver, Colo.
Application March 24, 1936, Serial No. 70,579
15 Claims. (Cl. 255—42)

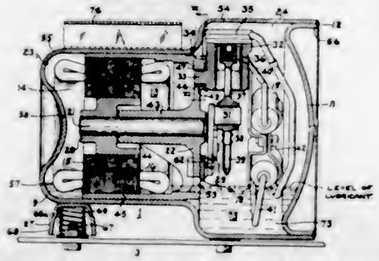
1. A mechanical hammer comprising a reciprocable ram, a power unit, and speed-controlled means automatically operable to connect said power unit in actuating relation with said ram.



2,101,879
PARA-HYDROXY-PARA'-ETHOXY DIPHENYLAMINE
George C. Strouse, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 25, 1936, Serial No. 92,605
10 Claims. (Cl. 260—128)

1. Para-hydroxy-para'-ethoxy diphenylamine in the form of white to gray crystals which dissolve in dilute aqueous sodium hydroxide and alkali metal sulfide to produce nearly colorless solutions that oxidize to a red to reddish-brown color, said crystals when purified and dried over sulfuric acid melting at 85.5° to 86° C.

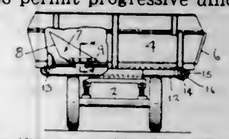
4. In a process of producing para-hydroxy-para'-ethoxy diphenylamine, the step which comprises condensing hydroquinone with paraphenetidine in the presence of a small amount of zinc chloride under the influence of heat.



2,101,880
CONTROL SYSTEM
William R. Tallaferro, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 15, 1935, Serial No. 45,049
10 Claims. (Cl. 171—119)

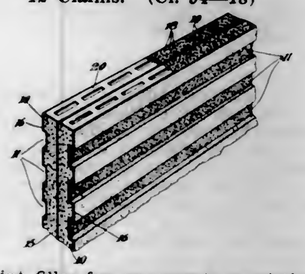
1. In a tap-changing system, in combination, a main transformer, a plurality of switches for changing taps on said transformer to vary the voltage on a power circuit, transition switches cooperating with the tap-changing switches to prevent them from opening and closing the power circuit, an auxiliary transformer having its primary winding energized from the main transformer and its secondary winding associated

with the transition switches for controlling the voltage across said transition switches and control means for preventing the simultaneous operation of the tap-changing and the transition switches.



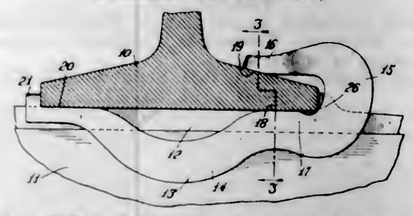
2,101,881
REFRIGERATION APPARATUS
Matson C. Terry, New Rochelle, N. Y., and Thomas A. Buckley, Springfield, Mass., assignors to Westinghouse Electric and Manufacturing Company, a corporation of Pennsylvania
Application November 4, 1932, Serial No. 641,284
Renewed February 25, 1937
14 Claims. (Cl. 230—58)

1. In refrigerating apparatus of the compression type wherein refrigerant undergoes cycles of evaporation, compression and condensation, a horizontal housing having portions of smaller and larger diameter, a motor disposed in the housing portion of smaller diameter and including a stator and rotor, the stator being in heat conductive relation with respect to the housing portion wall, a frame member supported by the housing interiorly thereof and having a central bearing, a shaft carried by the bearing and connected to the rotor, a compressor disposed in the housing portion of larger diameter and carried by the frame, mechanism disposed in the housing portion of larger diameter and operated by the shaft for operating the compressor, the lower part of the housing portion of larger diameter constituting a reservoir for lubricant and the lower portion of said frame having an opening therein providing for drainage of lubricant from the housing portion of smaller diameter to the reservoir, whereby a normal level of lubricant may be maintained below the motor air gap, and means actuated by said mechanism for effecting circulation of lubricant from the reservoir to parts requiring lubrication.



2,101,882
WAGON
Elton W. Vessey, Pasadena, Calif.
Application March 6, 1936, Serial No. 67,561
2 Claims. (Cl. 214—82)

1. A mobile vehicle to be used in the harvesting of vegetables comprising a body including a floor and having road wheels thereon, fixed upright members on the opposite upper ends of said body; a member arranged longitudinally of the body along one of the upper sides thereof forming at times a side member for said body and at other times serving to move the contents of the vehicle in a transverse direction toward the other side of said body to permit progressive unloading of the



vehicle from the open side thereof without interfering with the forward movement of the vehicle; means on the vehicle to move the movable side member transversely of the body; and rollers arranged longitudinally of said movable member and resting upon the floor of the body to facilitate the movement of said member in a transverse direction.

2,101,883
PAVING JOINT FILLER
Leroy E. Warner, Bond Hill, Ohio, assignor to The Philip Carey Manufacturing Company, a corporation of Ohio
Application July 9, 1930, Serial No. 466,774
12 Claims. (Cl. 94—18)

1. A joint filler for pavements consisting of a rubber body portion provided with a multiplicity of independent cells therein, each of said cells enclosed and separated from adjacent cells by the rubber forming said body portion, said body portion having a rubber surface of texture different from the texture of the body portion.

2,101,884
RAIL ANCHOR
Harold G. Warr, Park Ridge, Ill., assignor, by mesne assignments, to Poor & Company, a corporation of Delaware
Application May 16, 1936, Serial No. 80,047
5 Claims. (Cl. 238—330)

1. A light weight rail anchor comprising a bar having flattened and widened end portions which gradually increase in width and decrease in vertical thickness toward the ends and having an intermediate body portion of substantially rectangular cross-section having greater depth than its horizontal width, adapted to extend across beneath a rail with its wider faces arranged substantially perpendicular to the bottom of the rail base so that either wide face of the body may bear against a vertical face of a cross-tie, the said body portion of the bar being bent adjacent to one end into hook form to provide a wide upper jaw and a narrower lower jaw for gripping the top and bottom surfaces respectively of one base flange of the rail; the widened end of said jaw being of a width substantially corresponding to the depth of the said lower jaw which grips the bottom surface of the rail; and means comprising the flattened and widened portion at the other end of the body for engaging a vertical surface of the other rail base flange to lock the anchor on the rail; the flattened portions of the bar, which form the said upper jaw and the said vertical surface engaging means, being positioned so that each flattened portion projects laterally beyond the tie engaging planes of the sides of the under-rail body portion of the anchor but only above the plane of the top of the cross-tie, whereby substantially the same effective rail gripping and tie bearing effects are produced as where said anchor is formed of uniform square cross-section, corresponding to the depth of the jaw which engages the bottom of said first mentioned rail flange, throughout the entire length of the anchor.

2,101,885
STRAW PRODUCT AND TREATMENT THEREOF
William Whitehead, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application September 29, 1933, Serial No. 691,508
8 Claims. (Cl. 91—68)

1. In a process for the production of bloom effects on artificial straw containing derivatives of cellulose selected from the group consisting of organic acid esters of cellulose and cellulose ethers, the step which comprises applying to at least part of the surface of the straw, a coating composition comprising approximately 72% of a solvent for the derivative of cellulose, 15% of a derivative of cellulose selected from the group consisting of organic acid esters of cellulose and cellulose ethers and 8% of an organic precipitant for the derivative of cellulose in the composition; said coating composition temporarily dissolving the surface of the straw to permanently anchor therein the derivative of cellulose precipitated from said composition by the organic precipitant.

2,101,886
SPINNING SOLUTION
William Whitehead, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application October 24, 1933, Serial No. 695,049
5 Claims. (Cl. 106—40)

1. A spinning solution for the manufacture of filaments or films by extrusion processes containing 0.5 to 5.0 parts of oil, 25 parts of cellulose acetate, 0.06 to 0.10 part of a soap, and 75 parts of an organic solvent and 0.5 to 5.0 parts of a volatile non-solvent for the cellulose acetate, the cellulose acetate and the soap being in solution in the solvent.

2,101,887

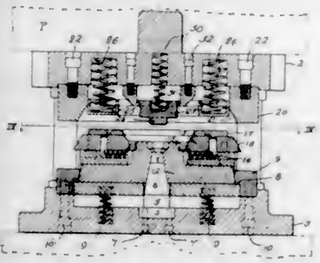
PRODUCTION OF EFFECTS ON MATERIALS

John Allan and James Arthur Wainwright, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application October 5, 1935, Serial No. 43,780. In Great Britain October 17, 1934

5 Claims. (Cl. 91—68)

1. Method of producing effects on filaments, yarns, fabrics, straws or the like, consisting substantially of a water-insoluble organic acid ester of cellulose or cellulose ether, which comprises printing thereon a suspension of a comminuted effect material in a solution of a film forming substance in a medium containing 25 to 50% of a volatile solvent for the cellulose derivative of the material treated, and a volatile non-solvent therefor, so as to bond the effect material to said cellulose derivative, said suspension having no solvent action on the cellulose derivative.



2,101,888

SHEET METAL PISTON MANUFACTURE

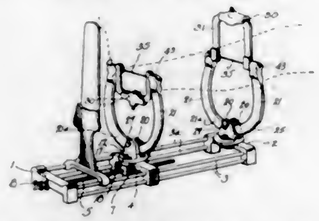
George M. Ambrosius, Lakewood, Ohio, assignor to The Standard Oil Company (Ohio), Cleveland, Ohio, a corporation of Ohio

Application May 25, 1936, Serial No. 81,665

7 Claims. (Cl. 153—73)

1. In die mechanism of the character described, reciprocatively opposed die blocks, a central stud fixed to one of said blocks having a cylindrical body and taper cam, a follower plate reciprocable on such stud, spring means tending to thrust said follower plate away from said block, a shouldered retaining ring for limiting movement of said follower plate, an inner set of radially movable die sections on said follower plate to be spread by said taper cam and having raised central portions with peripheral die surfaces, an outer set of radially movable die sections on said inner die sections, beveled cam surfaces on the outer ends of said outer die sections, spring means tending to separate the outer and inner die sections, a retaining ring for holding said outer die sections against disassembly, an internally beveled cam ring carried by the other of the first-mentioned opposed die blocks adapted to coact with the beveled cam surfaces on the outer ends of said outer die sections, a follower ring carried by the same die block internally of said cam ring, spring means normally urging said follower ring from the die block, a center follower carried by the same die block and having a blank-engaging center stud, spring means normally urging said center follower from the die block, and a shouldered retaining ring on the die block for limiting the movement of said center follower.

7. In die mechanism of the character described, reciprocatively opposed die blocks, a follower plate reciprocable on one of said die blocks, means for limiting the movement of said follower plate, an inner set of radially movable die sections on said follower plate having central portions with peripheral die surfaces, self-contained means for spreading said inner set of die sections, an outer set of radially movable die sections on said inner die sections, means for retaining said outer die sections against disassembly, a center resiliently-urged blank-engaging follower carried by the other of the first-mentioned opposed die blocks, a follower ring about said center follower, and cam means carried by the same die block to operate said outer die sections.



2,101,889

FRACTURE SPLINT

Roger Anderson, Seattle, Wash., assignor to The Tower Company, Seattle, Wash., a corporation of Washington

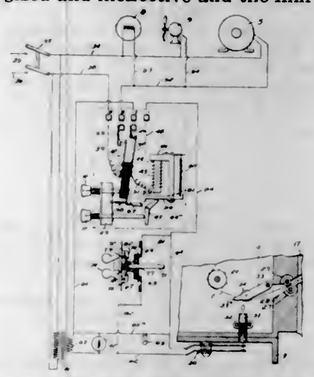
Application December 15, 1934, Serial No. 757,641

13 Claims. (Cl. 128—84)

1. In a fracture reducing splint, a traction yoke, a traction wire for transfixing a limb, a wire tautener frame for embracing the transfixed limb, and including means for gripping opposite end portions of the wire, and an adjusting means for spreading the frame to tension the wire, pivot means mounting the frame in the yoke for application of traction to the limb and permitting rotation of the frame about the axial line of the taut wire.

11. In a splint of the character described, a support, a yoke mounting base having a mounting pivot applied to the support, a traction yoke of U-shape, adjustably mounted in said yoke mounting base in the axial plane of the said mounting pivot and rotatably adjustable about a center in the extended axial line of the said mounting pivot, a wire tautener frame comprising spaced arms provided with trunnions supported by the arms of the traction yoke and a wire mounted under tension by said frame and extending between the spaced arms and passing through said center.

2,101,890



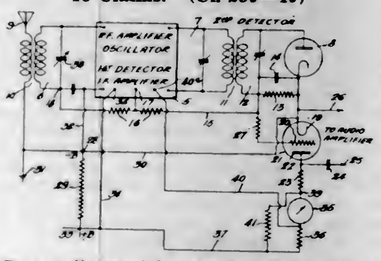
PROJECTOR

Lloyd J. Andres, Grand Rapids, Mich., assignor to Automatic Instrument Company, a corporation of Michigan

Application May 14, 1934, Serial No. 725,470

6 Claims. (Cl. 88—17)

1. In a motion picture machine having a film driving motor and a projector lamp, an unlocking relay, manually operable switch means for energizing said three elements, automatic means for locking said means in closed position and unlocking it, a governor operated by the motor, a film safety switch, a film threading lamp connected in parallel with the relay and lighted when the said switch means is closed, and means operated by the governor for maintaining the relay de-energized and ineffective and the film threading lamp unlighted at the operating speed unless the film safety switch is closed.



2,101,891

TUNING METER

George L. Beers, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

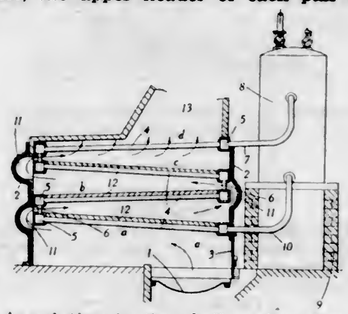
Application May 29, 1936, Serial No. 82,599

18 Claims. (Cl. 250—40)

4. In a radio receiving system, the combination of a resonance indicating device, a common potential supply source for said system and said indicating device, said device being responsive both to received signals and variations in the potential of the supply source, and means connected in circuit with said device for rendering said device substantially independent of said potential supply source variations.

2,101,892

WATER TUBE BOILER



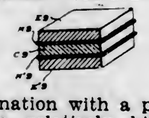
Albert Oliver Blatchford, Amballes, Guernsey, Channel Islands

Application June 1, 1937, Serial No. 145,821

In Great Britain September 29, 1936

2 Claims. (Cl. 122—355)

1. In a water tube boiler or water heater, a plurality of sets of tubes arranged in a zig-zag manner, headers arranged transversely to the tubes and receiving the ends of the tubes, said headers being arranged in narrowly spaced pairs, short ascending conduits connecting each pair of headers, baffles covering the upper sides of the tubes for their full length, an outer shell totally enclosing the said tubes, headers and upstanding conduits, a furnace beneath the tubes, the lower header of each pair and the shell being spaced to allow the free passage of the products of combustion around each lower header and between each pair of headers over said upstanding conduits, the upper header of each pair being sealed in relation to the shell against free passage of products of combustion past it vertically.



2,101,893

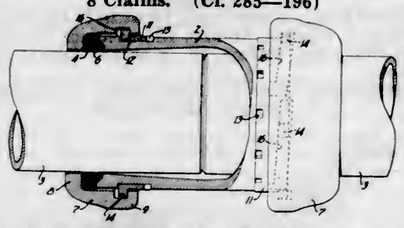
PIEZOELECTRIC APPARATUS

Samuel A. Bokovoy, Audubon, and Paul D. Gerber, Woodlynne, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application November 30, 1935, Serial No. 52,304

8 Claims. (Cl. 171—327)

1. The combination with a piezo-electric element having a relatively high fundamental period of vibration, of a pair of electrodes therefor and a layer of insulating material having a dielectric constant greater than air removably interposed between said element and each of said electrodes.



2,101,894

PIPE JOINT

Roger C. Boughton, San Francisco, Calif.

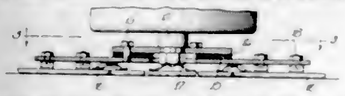
Application August 9, 1935, Serial No. 35,446

8 Claims. (Cl. 285—196)

1. A pipe joint comprising an annular element surrounding a pipe, a gasket seated against the element, a second non-rotatable annular element surrounding the pipe and bearing against the gasket, one of said elements overlapping the other, and a locking ring interposed between the lapping surfaces of the elements and turnably mounted on one of the elements and engageable with the other for locking the latter together.

2,101,895

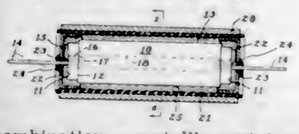
MACHINE FOR TROWELING



Harold S. Boulton, Chicago, Ill.

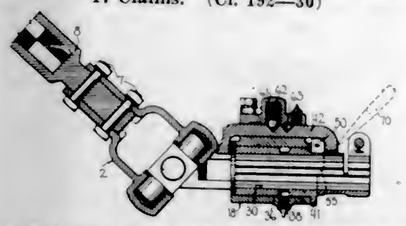
Application December 28, 1936, Serial No. 117,842

4 Claims. (Cl. 94—45)



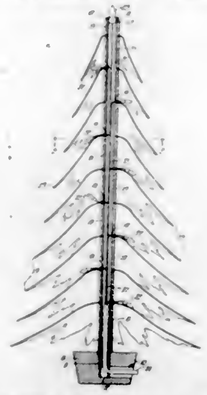
1. In a troweling machine, the combination of a horizontally rotatable carrier, a plurality of

separate angularly arranged trowels mounted beneath said carrier, and a motor mounted verti-



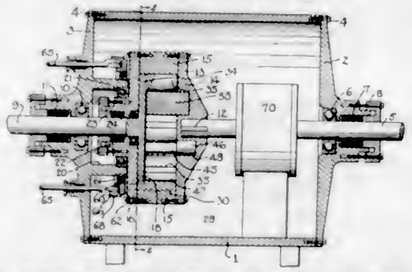
cally above the center of said carrier and connected to rotate the carrier and the trowels in a plane.

2,101,896
CAPACITOR
Leslie G. Burlingame, Erlton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application December 29, 1933, Serial No. 704,410
6 Claims. (Cl. 175—41)



1. In combination, a metallic container having a plurality of openings therein, a container of insulating material disposed within said metallic container in contacting relation therewith and having a plurality of openings therein registering with the openings in said first named container, a fixed condenser element having terminal leads attached to the opposite ends thereof disposed within said second named container in spaced relation thereto, a pair of metallic closure members each having a central opening therein disposed in the openings in said second named container with said terminal leads projecting through the openings in said closure members, a liquid dielectric impregnating said condenser element and filling the space between said insulating container and said condenser element, and means for sealing the openings in said closure members about said terminal leads.

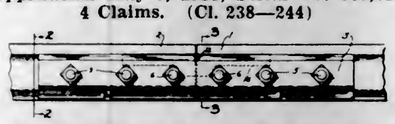
2,101,897
UNIVERSAL JOINT CONTROLLED CLUTCH
Wilbur J. Coultas, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application May 11, 1935, Serial No. 20,978
17 Claims. (Cl. 192—30)



1. In combination, a pair of driving and driven shafts, a two-part universal joint having one part connected to rotate with one of said shafts and the other part connected to rotate with respect to the other of said shafts, means carried with said other universal joint part and movable with respect thereto for optionally connecting it to the associated shaft in driving relation, and means responsive to the degree of angulation between said driving and driven shafts for shifting said optionally movable means.

2,101,898
ORNAMENT
David H. Crosser, Chicago, Ill., assignor to National Tinsel Mfg. Co., Manitowoc, Wis., a corporation of Wisconsin
Application March 29, 1935, Serial No. 13,662
8 Claims. (Cl. 41—15)

1. An ornament comprising an elongated socket, a plurality of one-piece ornamental skirts having apertures therein adapted to receive said socket and mounted thereon in a manner to surround the socket in spaced relation to each other intermediate the ends of the socket, a plurality of spacers surrounding said socket and positioned, respectively, between the lowermost of said skirts and the base of said socket and between the upper end thereof and the respective skirts, each of said skirts extending downwardly to conceal the respective subjacent spacers, a collar having an annular portion in said socket for resisting lateral displacement of the collar and socket, and a flange on said collar overlying the top of the socket and the upper edge of the uppermost spacer.



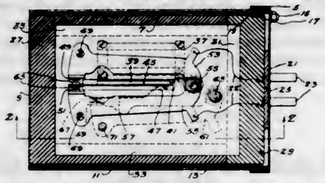
2,101,899
ROTARY FLUID CLUTCH
William N. Eddins, San Antonio, Tex.
Application November 9, 1935, Serial No. 48,980
2 Claims. (Cl. 192—61)

1. A device of the character described including an outer casing adapted to be filled by a liquid, a drive shaft extending into said casing, a driven shaft extending from said casing, a rotor head on said drive shaft, a housing on said driven shaft, a toothed wheel mounted eccentrically of said housing and adapted to mesh with said rotor head at one side thereof, an interceptor head in said housing contacting with the outer ends

of the teeth on said wheel and the inside of said rotor head, and separating said housing into two chambers, a fluid port in each of said chambers, a passage from each of said ports leading directly to the exterior of said housing, a valve for said ports, means to adjust said valve to regulate the volume of intake and discharge of liquid by said wheel and rotor head to thus control the relative rotation of said driven shaft by said drive shaft.

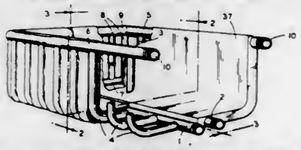
2,101,900
RAIL JOINT SHIM
Albert Frank Fifield, St. Catharines, Ontario, Canada, assignor to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio
Application May 3, 1933, Serial No. 669,218
4 Claims. (Cl. 238—244)

1. A wear compensating means for rail end joints of the type comprising a pair of joint side bars and bolts projected through the bars and the intermediately disposed rail web, comprising a metallic shim adapted to be disposed between the bar and the rail being of angular cross-section tapering in thickness toward both ends from an intermediate portion and having an intermediate joint fin receiving notch, said notch substantially bisecting the generally horizontally extending shim portion, and a lateral extension extending from the side opposite the notch, the extension being sufficiently narrow to extend between a pair of rail joint bolts and of sufficient length and thickness to sufficiently compensate for the notch to prevent the concentration of bending stresses at the notch and a consequent tendency of the shim to break at its intermediate portion.



2,101,901
GLARE SHIELD
Joseph H. Fletcher, Southgate, Calif.
Application September 26, 1936, Serial No. 102,776
7 Claims. (Cl. 296—97)

1. A glare shield comprising a hollow shield element, a pair of extensible links pivotally connected to said shield element and movable therein, and a second U shaped shield element pivotally connected to the other ends of said links and fitting over said first-mentioned shield element.



2,101,902
VIBRATORY CONTACT DEVICE
Emile C. Guedon, Audubon, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application August 31, 1935, Serial No. 38,739
6 Claims. (Cl. 200—90)

1. An electrical vibrator device comprising, in combination, a metallic casing having separable portions interengaging to provide a closed electrical shield and container, means providing inner walls for said casing of resilient material, certain of said walls being recessed, and an electrical vibrator mechanism having portions engaging said

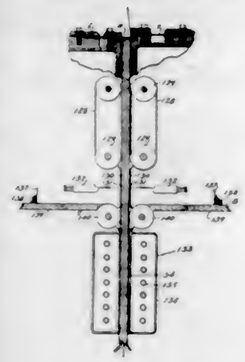
walls within the recesses to hold said unit in spaced relation to the interior of said casing, said recesses and walls forming the sole supporting and positioning means for said mechanism.

2,101,903
COMBUSTION CHAMBER HEATING DEVICE
Mora S. Hall, Baltimore, Md., assignor to May Oil Burner Corporation, a corporation of Maryland
Application May 16, 1935, Serial No. 21,885
4 Claims. (Cl. 122—368)

3. In a house heating boiler, a quick-heating water compartment forming the fire pot of the boiler, said fire pot being closed at the rear end and open at the top, said quick-heating water compartment being formed of a plurality of sections wherein each section has its individual fluid circulating system, and said quick-heating water compartment comprising water inlet means at the bottom thereof, a lower, rear tubular manifold communicating with said water inlet means, an upper, rear tubular manifold, a plurality of tubular conduits extending from said lower, rear manifold to said upper, rear manifold and disposed to deliver water from said lower, rear manifold to said upper, rear manifold, an upper, side tubular manifold communicating with said upper, rear manifold, a plurality of tubular conduits extending from said inlet means and communicating with said upper, side manifold and disposed to deliver water from said inlet means to said upper, side manifold, another upper, side tubular manifold, a plurality of tubular conduits extending from said inlet means and communicating with said latter upper, side manifold and disposed to deliver water from said inlet means to said latter upper, side manifold, and refractory material upon said manifolds and said tubular conduits, said refractory material forming the inner fire facing for said water compartment.

2,101,904
RECOVERY OF COMPACT METALLIC MAGNESIUM FROM MAGNESIUM IN FINELY DIVIDED FORM
Fritz Hansgirg, Radenthein, Austria, assignor to American Magnesium Metals Corporation, Pittsburgh, Pa., a corporation of Delaware
No Drawing. Application November 20, 1934, Serial No. 753,892. In Austria May 4, 1934
3 Claims. (Cl. 75—67)

1. The method of producing substantially pure magnesium from magnesium in a finely divided



state, which comprises making the finely divided magnesium into a paste with a liquid hydrocarbonaceous impasting agent, heating the said paste up to a temperature at which partial decomposition, by cracking, of the hydrocarbonaceous impasting agent occurs while agitating the mass under treatment to form solid granular aggregates therefrom, and recovering the magnesium from the said aggregates by sublimation.

2,101,905

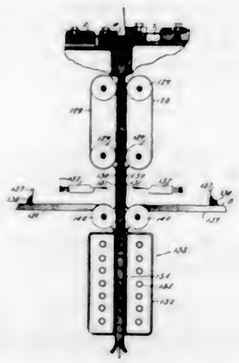
PILE FABRIC AND PROCESS FOR MAKING THE SAME

Ernest Hopkinson, New York, N. Y., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application November 2, 1929, Serial No. 404,457
16 Claims. (Cl. 154—2)

1. The method of forming a sheet which comprises continuously advancing a web of fibrous material, repeatedly and successively forming folds in the advancing web with adjacent faces of the folds in contact throughout their lengths, applying an adhesive to the faces formed by the loops in the folds, and drying the adhesive.

15. A pile fabric having a pile consisting of a series of upstanding folds of fibrous material with a side of each fold in lateral contact throughout its length with the other side of said fold and in lateral contact throughout its length with the side of an adjacent fold, and an adhesive in which the loops of the folds are embedded.



2,101,906

PILE FABRIC AND MACHINE FOR MAKING THE SAME

Ernest Hopkinson, New York, N. Y., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Original application November 2, 1929, Serial No. 404,457. Divided and this application July 9, 1931, Serial No. 549,636
11 Claims. (Cl. 154—1)

1. A machine for manufacturing fibrous sheet material comprising in combination, apparatus for continuously advancing fibrous material in web form, parallel blades arranged transversely of and edgewise to the web, means for reciprocating the blades to fold the web, members against which the web is clamped by the blades, mechanism for reciprocating the blades in a direction parallel to the web, the means and mechanism being so synchronized that the motion of

the blades parallel to the web takes place only when one blade is fully extended and the other fully withdrawn.

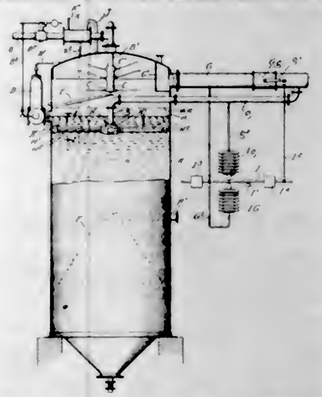
2,101,907

METHOD OF MAKING RUBBER ARTICLES

Victor H. Hurt, Naugatuck, Conn., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application April 3, 1935, Serial No. 14,443
2 Claims. (Cl. 18—58)

1. In the manufacture of a rubber article with raised and depressed markings on the surface thereof by the deposition of a rubber film from latex on a deposition backing having a deposition surface with depressed and relief portions, the steps which comprise applying latex to the deposition surface to fill in the depressions and cover the relief portions of said surface, and applying to the exposed surface of the deposited latex layer and before drying thereof a color in an aqueous medium contrasting with the color of the latex so that the contrasting color will bleed through the latex layer to the relief portions of the backing without bleeding through to the depressed portions of the backing and there will be provided in the marked surface of the rubber film a color in the depressed portions contrasting with the color of the raised portions thereof.



2,101,908

METHOD OF AND APPARATUS FOR TREATING WATER

Charles E. Joos, Philadelphia, Pa., and George H. Gibson, Upper Montclair, N. J., assignors to Cochrane Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application July 17, 1935, Serial No. 31,832
10 Claims. (Cl. 210—14)

1. In the hot process of water softening, the method which consists in passing the water and chemical precipitating material for softening the water, into a pool, and injecting jets of steam into said pool distributed at different radial distances from a vertical axis passing centrally through said pool with such directions as to create a circulatory movement to substantially all of the water in the upper portion of said pool about said vertical axis whereby the water movement contributes to the formation of flocculent

precipitate masses large enough to settle rapidly out of the water.

2,101,909

SELF-OPENING AND CLOSING CAP FOR COLLAPSIBLE TUBES

Gaston L. Lateur, San Francisco, Calif.

Application November 18, 1935, Serial No. 50,417
9 Claims. (Cl. 221—60)

1. In a device of the type described, a cap for a collapsible tube, said cap having a substantially conical-shaped end with an opening extending from the apex and being entirely disposed on one side of a diametrical line extending across the end, and a hollow mouth piece slidable in the cap and being movable through the opening when expelling the tube contents, said mouth piece having an end that will close the opening and lie flush with the remaining surface of the cap when the cap is in closed position.

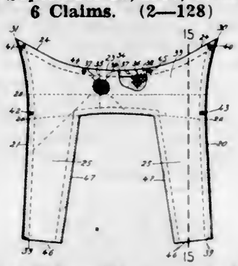
2,101,910

PROCESS FOR THE MANUFACTURE OF ALKOXYANTHRAQUINONES

Frank Lodge and Colin Henry Lumsden, Blackley, Manchester, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application July 18, 1936, Serial No. 91,429. In Great Britain July 25, 1935
9 Claims. (Cl. 260—59)

1. Process for the manufacture of alkoxyanthraquinones in which the alkoxy substituent contains a long-chain alkyl group with 10 to 20 carbon atoms, which comprises reacting an alkali metal compound of a monohydric alcohol with 10 to 20 carbon atoms, with an anthraquinone compound which carries as a substituent a radical chosen from the group consisting of methoxy, ethoxy, propoxy, sec.-propoxy, butoxy, sec.-butoxy, tert.-butoxy, amyloxy, sec.-amyloxy, phenoxy and cresoxy.



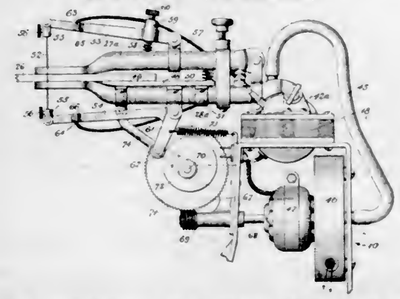
4. Process for the manufacture of 1-amino-4-arylamino-2-alkoxyanthraquinones, in which the alkoxy substituent contains a long-chain alkyl group with 10 to 20 carbon atoms, which comprises reacting an alkali metal compound of a monohydric alcohol containing 10 to 20 carbon atoms with a 1-amino-4-arylaminoanthraquinone which is substituted in the 2-position by a radical chosen from the group consisting of methoxy, ethoxy, propoxy, sec.-propoxy, butoxy, sec.-butoxy, tert.-butoxy, amyloxy, sec.-amyloxy, phenoxy and cresoxy.

2,101,911

COLLAR

Harry Lowenbraun, Brooklyn, and Morris Schwartz, New York, N. Y.

Application September 13, 1937, Serial No. 163,613
6 Claims. (2—128)

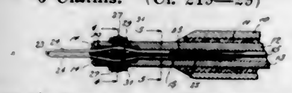


1. A convertible collar comprised of a neck portion and long pointed extremities, fastening means on the reverse side of said long pointed extremities, other fastening means to coact with said fastening means upon the long pointed extremities and along the back portion of the reverse side of said collar to detachably hold said long pointed extremities in an adjustable and proper position, a slide fastener along the center and front edges of said collar with an adjustable slide fastener member along said front edges of said collar for positioning said collar in any number of one or more desirable positions.

2,101,912

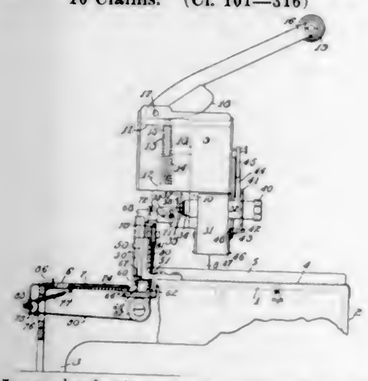
PYROELECTRIC TOOL

Edwin L. Meyer, Bridgeport, Conn.



Application December 11, 1935, Serial No. 53,979
21 Claims. (Cl. 219—29)

1. A pyroelectric saw having a burning element for cutting a burnable workpiece; a combined smoke-removing and work-positioning means on one side of the workpiece adjacent the burning element of the saw, said means in-

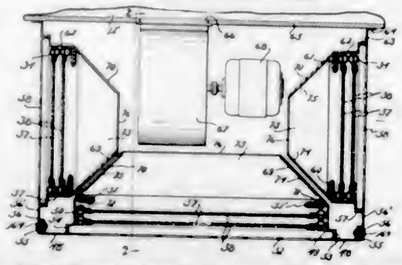


cluding a pipe for collecting air containing smoke; and means for removing the air containing smoke so collected.

2,101,913
PYROGRAPHIC PENCIL
Edwin L. Meyer, Bridgeport, Conn.
Application January 15, 1936, Serial No. 59,243
6 Claims. (Cl. 219—29)

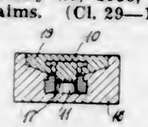
3. In an electric pyrographic pencil, a handle portion having a longitudinally extending hole therein; a pair of low resistance conductors arranged in said hole in side by side relation, each of said conductors having a substantially plane portion, said portions being substantially parallel and facing each other near the working end of the pencil; current-insulating means interposed between said conductors and engaging the substantially plane portions thereof, said portions being grooved along the length of the pencil to form channels for receiving the end lengths of a resistance wire; and a draft means passing through one of said plane portions and operable from the exterior of the pencil to draw the associated end length of resistance wire outward from the center line of the pencil to clamp said end length in said channel.

2,101,914
CHECK SIGNER
Howard I. Morris, Indianapolis, Ind.
Application June 15, 1935, Serial No. 26,729
10 Claims. (Cl. 101—316)



1. In a check signer, the combination with a bed, of a reciprocating plunger mounted above said bed and having impression means, severing means at the delivery end of said bed, means for removing the severed check from said bed, and means operated by the movement of the said head in making an impression for successively operating said severing means and said removing means.

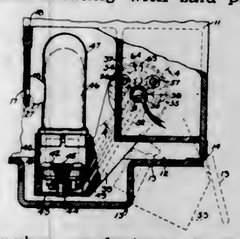
2,101,915
PROCESS OF MAKING RUBBER COMPOSITION
Robert R. Olin, Akron, Ohio, assignor to The Worthington Ball Company, Elyria, Ohio, a corporation of Ohio
No Drawing. Application January 2, 1935, Serial No. 97
8 Claims. (Cl. 18—50)



1. The process of providing an improved composition of material consisting of separately preparing an aqueous dispersion of uncoagulated vulcanized rubber latex and a solution of dissolved unvulcanized and substantially deresinated balata, coagulating the balata and subsequently mixing the same with the vulcanized rubber latex in the absence of balata vulcanizing materials to form a substantially homogeneous mixture of tough resilient material.

2,101,916
WARM AIR CIRCULATING AND FILTERING APPARATUS
Herman A. Phail, River Rouge, Mich.
Application September 16, 1932, Serial No. 633,500
2 Claims. (Cl. 230—128)

1. In a device of the class described, a blower or fan housing comprising corner supporting members; inwardly projecting flanges on each of said supporting members; a pair of side walls; a baffle plate carried by and positioned between said side walls; and a channel carried by each of said side walls slidable over said flanges for retaining said baffle plates projecting inwardly from one of said openings.



2,101,917
METHOD FOR MAKING VALVE TAPPETS
Albert S. Plater, Saginaw, Mich.
Application January 25, 1935, Serial No. 3,456
4 Claims. (Cl. 29—156.7)

4. The method of forming a tappet which consists in first forming a tubular core with one shouldered and slotted end, inserting a sound deadening disc in the core intermediate the ends thereof, placing the core in a "flask" and casting a head on the shouldered and slotted end thereof to fill the same at one side of the disc, welding a stem to the exposed projecting end of the core in a manner to leave the same unfilled at the opposite side of the disc, and then finish grinding said tappet.

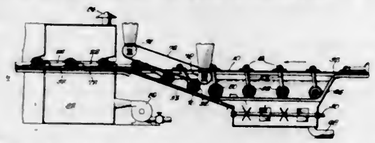
2,101,918
MOUNTING FOR LIGHT SENSITIVE DEVICES
Ernest Ross, Los Angeles, Calif., assignor to United Research Corporation, Burbank, Calif., a corporation of Delaware
Application June 8, 1936, Serial No. 84,111
14 Claims. (Cl. 179—100.3)

1. A light sensitive cell mount comprising a stationary support, a bracket having a passage therein, a socket on said bracket adapted to support a light sensitive cell, a pivotal connection between said bracket and said support, said connection having an opening along the pivotal axis thereof communicating with said passage, and

current carrying conductors attached to said socket and extending through said passage and said opening in said pivotal connection.

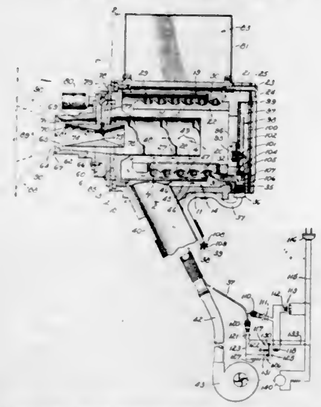
2,101,919
PRODUCTION OF REFINED MAGNESIUM AND MAGNESIUM ALLOYS
Georg Schichtel, Radenthein, Austria, assignor to American Magnesium Metals Corporation, Pittsburgh, Pa., a corporation of Delaware
No Drawing. Application August 19, 1935, Serial No. 36,853. In Austria March 30, 1933
5 Claims. (Cl. 75—67)

1. The method of producing refined magnesium, which comprises melting impure magnesium with a fluid flux containing as purifying agents a mixture of antimony sulphide, chloride of iron, zinc chloride and magnesium chloride, agitating the molten metal with the flux, allowing the metal and the flux to segregate from each other, and separating the metal from the flux.



2,101,920
MULTI-PLY WOOD BAKER'S PEEL
Henry L. Schroeder, Chicago, Ill.
Application June 3, 1935, Serial No. 24,595
5 Claims. (Cl. 107—67)

1. In a composite wooden baker's peel, an inner core having a tapered tip, veneered wooden sheets of uniform thickness attached to each other and to the tapered tip at each side, overlapping the core and contacting with each other beyond the tip, the grain of the veneer of corresponding sheets on opposite sides of the tip being parallel and at right angles to that of the adjacent veneer sheet to prevent warping of the peel when it is heated, and the grain of the veneered sheets in the tip being at an angle of forty-five degrees with respect to the edge of the tip to form a thin hard wearing edge.

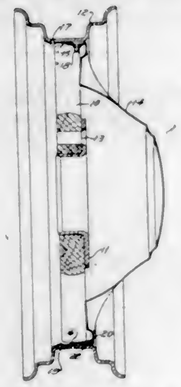


2,101,921
MINERAL WOOL INSULATION
George D. Shaver, Crown Point, Ind.
Application April 2, 1937, Serial No. 134,668
7 Claims. (Cl. 92—56)

1. That improvement in processes of forming mineral wool insulation in cylindrical form, which includes the steps of rotating a foraminous mandrel about an axis extending therethrough in a bath containing particles of such wool and applying suction to the interior of said mandrel to initiate tenacity between said mandrel and said wool particles, and moving said mandrel in a direction normal to its axis of rotation.

5. In a machine of the class described, a vat adapted to contain a suspension of fibrous material, a plurality of hollow foraminous mandrels rotatable about their individual axes and supported in bearings carried by a conveyor movable along a path adjacent to and through said vat, means for applying suction to the interior of said mandrels, and means for revolving said mandrels in said bearings whereby the mandrels are immersed and then removed from the vat after accumulating fibrous material thereon.

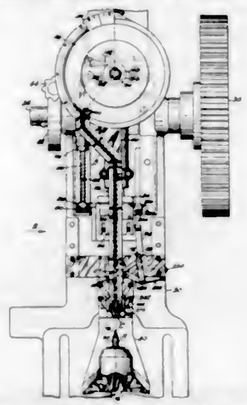
2,101,922
SPRAYING APPARATUS
Ludwig Stoesling, Monrovia, Calif.
Application February 19, 1935, Serial No. 7,237
21 Claims. (Cl. 91—45)



6. A method of applying to a surface a coating of paraffin, which method includes the steps of: heating said paraffin until it is molten; spraying said paraffin onto said surface in molten condition and in atomized state by moving toward said surface an inner stream of low velocity hot air containing atomized paraffin; and protecting said stream of atomized paraffin from contact with the atmosphere by surrounding said stream with a moving annular envelope of heated gas flowing toward said surface in concentric relation with said inner stream of atomized paraffin.

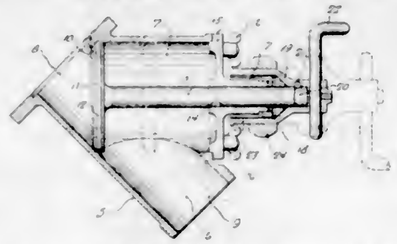
12. In a spraying device of the character described, the combination of: a head structure having an opening therein; means for delivering a stream of low pressure non-combustible gas to said opening; means in said opening for dividing said stream of gas into inner and outer substantially concentric streams, said means including a tube disposed in said opening, said tube having an annular edge adapted to pierce said stream, whereby said inner stream may flow through said tube and said outer stream may flow through the

space between said tube and the walls of said opening; passage means communicating with the interior of said tube; and means for delivering to said passage means, and thus to said inner stream of gas moving through said tube, the material to be sprayed, whereby said material may be picked up by said gas constituting said inner stream and discharged inside said outer stream of gas and against a surface to be coated, the low pressure of said gas preventing such spreading or mixing of said streams as would prevent a smooth flow of concentric streams from said head to a surface to be coated.



2,101,923
VEHICLE WHEEL
Charles R. Stough, Lansing, Mich., assignor to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan
Application July 13, 1935, Serial No. 31,148
8 Claims. (Cl. 301—37)

1. The combination with a wheel and a cover therefor including an axially extending peripheral flange, of means for detachably securing the cover to the wheel comprising a pair of resilient attaching elements permanently secured to the wheel at widely spaced points adjacent the periphery of the wheel, one of said elements adapted to engage the outer surface of said flange and to exert thereagainst a yielding pressure in a radially inward direction, the other of said elements adapted to engage the inner surface of said flange and to exert a yielding pressure thereagainst in a radially outward direction.

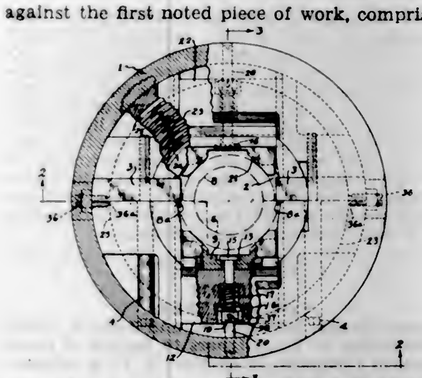


2,101,924
RIVETING MACHINE
Edward Turnquist, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 22, 1935, Serial No. 32,515
5 Claims. (Cl. 78—48)

5. In a machine for heading rivet shanks having a conical recess in their bottoms, the combination of a support for work to be riveted; a yielding pin normally projecting through the rivet receiving aperture of the work, said pin having a conical tip adapted to register with the recess of a rivet shank to be inserted in the work and guide the same through the aperture of the work; a heading tool including the conical pin tip, said tip being adapted to cause the shank metal to flow laterally into the head-forming cavity of the tool upon movement of the rivet shank to-

ward the stopped pin; and means stopping the pin in cooperative position with the tool.

2,101,925
VALVE
Arthur B. Webb, Milwaukee, Wis., assignor to Cream City Boiler Company, Milwaukee, Wis., a corporation of Wisconsin
Application March 15, 1937, Serial No. 130,989
6 Claims. (Cl. 251—43)

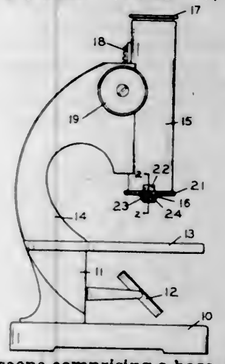


1. In a valve of the character described, a valve body having a valve seat and a cover aligned with but spaced from the valve seat, a movable valve element adapted to engage said seat to close the valve, a valve stem connected with the movable valve element and extending slidably through said cover, a part having a readily disengageable connection with the cover to secure the same against movement away from the cover, and another part connected with the valve stem and having threaded engagement with the first named part, so that rotation of said second named part in one direction applies closing force onto the valve element, the reaction of which is carried through said first named part to the cover.

2,101,926
RAIL CHUCK FOR MACHINE TOOLS
Theodore A. Wettig, Cincinnati, Ohio
Application May 22, 1936, Serial No. 81,274
6 Claims. (Cl. 279—116)

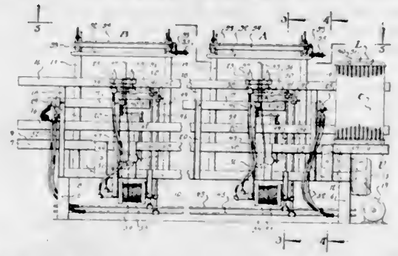
1. A rail chuck for machine tools for holding a plurality of pieces of work for a tooling operation comprising a body, a plurality of work holding jaws movable in said body, rails mounted in said body towards which one of the said jaws is adjustable for clamping one of the pieces of work, and means for clamping another piece of work

against the first noted piece of work, comprising



in combination with said work holding jaws a floating scroll.

2,101,927
PROCESS FOR NITRATING SUCROSE
Joseph A. Wyler, Allentown, Pa., assignor to Trojan Powder Company, Allentown, Pa.
No Drawing. Application September 28, 1936, Serial No. 102,979
7 Claims. (Cl. 260—145)



1. The process of nitration which comprises nitrating sucrose in the presence of a mixture consisting predominantly of an alkyl ester of a mono hydroxy aliphatic carboxylic acid, said alkyl group containing not more than five carbon atoms, and one or more members of the group consisting of: methyl nitrate, ethyl nitrate, propyl nitrate, amyl nitrate, butyl nitrate, dichlorethyl ether, tetrachlorethane, carbon tetrachloride, chloroform.

2,101,928
MICROSCOPE
William Bausch, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application November 22, 1934, Serial No. 754,297
4 Claims. (Cl. 88—39)

1. A microscope comprising a base, an arm carried by said base, a body tube adjustably carried by said arm, means for moving said body tube for focusing an objective lens mount threadedly carried directly by said tube, means for rotating said objective lens to make small adjustments of focus, and means for limiting the rotation of said objective lens mount in both directions.

2,101,929
SOLDERING MACHINE
Martin G. Boerger, Racine, Wis., assignor to Modine Manufacturing Company, Racine, Wis., a corporation of Wisconsin
Application September 16, 1936, Serial No. 101,123
5 Claims. (Cl. 113—59)

1. In a soldering machine, the combination of two spaced burner nozzles, means for normally supplying sufficient fuel to the nozzles to maintain a pilot flame, means for supplying an increased volume of fuel to the nozzles to cause flames to be projected therefrom, normally closed valves for controlling the supply of fuel to the nozzles, spaced wire solder feeds for feeding wire solder to points adjacent the flames, means for carrying a radiator core between the nozzles and the solder feeds in such a manner that the solder has a wiping engagement with the opposite sides of one header of the core adjacent a junction in said header and the flames projected from the nozzles impinge the portions of the header adjacent the point of wiping engagement of the solder therewith, and means operable by the advance of the core for opening said valves and controlling the feeding of the solder.

2,101,930
COPPER BASE ALLOY
Charles H. Davis, Cheshire, and Elmer L. Munson, Naugatuck, Conn., assignors to The American Brass Company, Waterbury, Conn., a corporation of Connecticut
No Drawing. Application April 13, 1935, Serial No. 16,204
9 Claims. (Cl. 148—32)

1. An alloy comprising copper, cadmium, nickel, zinc and aluminum in proportions within the following ranges:

	Percent
Copper	60. to 98.7
Cadmium	.05 to 3.0
Nickel	.5 to 30.0
Aluminum	.25 to 4.0
Zinc	.5 to 39.2
Manganese	0. to 1.0

said alloy being characterized by superior resistance to intercrystalline attack or corrosion when exposed to steam or hot water.

2,101,931
ENGINE STARTER CONTROL APPARATUS
John B. Dyer, Pendleton, Ind., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 11, 1933, Serial No. 688,887
20 Claims. (Cl. 290—37)

20. Control apparatus for engine starting devices comprising a current source, a starting motor adapted to be operated by current from said source, a magnetic switch for connecting the

starting motor with the current source and for establishing driving connection between the starting motor and the engine, a control switch for controlling the operation of said magnetic switch having fixed and movable contacts, manually operable means for causing said movable contact to be moved to position to close the switch in order to cause the starting motor to become operative, means operable by the engine when it begins to run under its own power for

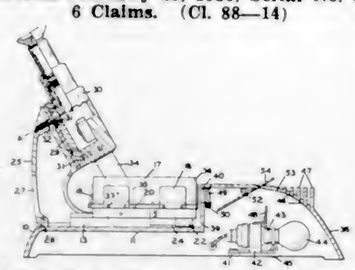
moving said movable contact to position to open said control switch in order to render the starting motor inoperative, and another means also operable by the engine tending to move the movable contact to open the control switch and adapted to hold said control switch open independently of the first mentioned means, said last named means being effective on said movable contact only after said control switch is opened.

2,101,932

EXPOSURE CONTROL

John Eggert, Leipzig-Gohlis, and Hans Friedrich Nissen, Dessau, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

Application April 19, 1935, Serial No. 17,318
In Germany April 20, 1934
1 Claim. (Cl. 95—75)



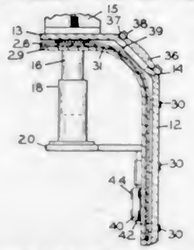
An apparatus for exposure control comprising in combination a source of light for scanning a picture, a photo-electric device which receives the light varying in intensity with the density of said picture thereby causing a variation of an electric current, a galvanometer deflected in accordance with said variations of electric current, a mirror provided on said galvanometer, a second source of light projecting a pencil of light on said mirror, said pencil of light being reflected by said mirror, a series of photo-electric devices arranged one beside the other within the reach of said reflected pencil of light at a distance smaller than the breadth of the reflected pencil, relays arranged in a circuit with said photo-electric devices, a further series of relays actuated by said first named relays, a source of light for exposing a photographic layer, a resistance arranged in a circuit with said source of light and switches actuated by said relays for switching on and switching off parts of said resistance for varying the intensity of said source of light for exposing said layer in accordance with said variations of electric current, a wire coil arranged on the relay situated farthest towards the end of the reach of said reflected pencil of light when said mirror is most deflected, and switches actuated by said wire coil for keeping switched off the whole resistance in the circuit of said source of light for exposing said layer when said reflected pencil of light passes beyond the last photo-electric device of said series.

2,101,933

COLORIMETER

Gustave Fassin, Irondequoit, and John R. Miles, Rochester, N. Y., assignors to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application February 25, 1936, Serial No. 65,650
6 Claims. (Cl. 88—14)



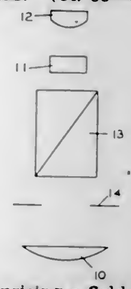
1. A colorimeter comprising a base, two specimen troughs horizontally slidably mounted on said base, a support carried by said base, an observation system, two transparent plungers carried by said observation system for immersion in said troughs, said plungers each having a vertical light receiving surface, and means for mounting said observation system on said support above said troughs for sliding movement in an inclined plane whereby said plungers may be selectively immersed or withdrawn from said troughs.

2,101,934

COLORIMETER

Gustave Fassin, Irondequoit, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application February 25, 1936, Serial No. 65,651
5 Claims. (Cl. 88—14)



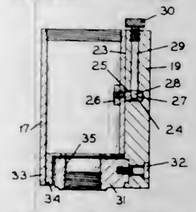
1. A colorimeter having in combination a base, a vertical wall carried by said base, a non-vertical wall carried at the upper end of said vertical wall, a downwardly facing window in said non-vertical wall, a horizontal platform carried by said non-vertical wall, an observation system mounted on said platform, two plungers secured on said platform below said observation system, two specimen cups vertically movably mounted on said vertical wall one beneath each plunger, a flexible scale member secured to each cup, and means for guiding said scale members beneath said window.

2,101,935

ANALYZING OCULAR

Leon V. Foster, Irondequoit, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application February 28, 1935, Serial No. 8,675
3 Claims. (Cl. 88—39)



2. An ocular comprising a field lens, the emergent rays from which are not collimated, an analyzing prism and an eye lens assembly, said eye lens assembly comprising crossed cylindrical lenses so spaced and so related to the analyzing prism and to each other as to form an astigmatic system neutralizing the astigmatism of the prism.

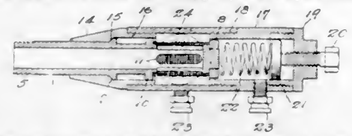
2,101,936

MICROSCOPE

George B. Gallasch, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application October 9, 1935, Serial No. 44,240
5 Claims. (Cl. 88—39)

1. In a microscope, a cylindrical body tube, a support having a cylindrical surface for receiving said body tube, a stud on said body tube, said stud having a hole, a recess in the cylindrical surface of said support, and a screw threaded in said support perpendicular to said stud and having a tapered end for engaging the hole in said stud to draw said tube against said surface.



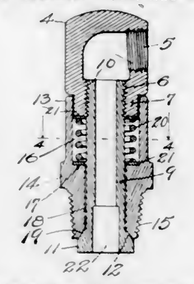
2,101,937

SWIVEL PIPE JOINT

Chipman H. Giberson, Elyria, Ohio

Application July 30, 1937, Serial No. 156,589
3 Claims. (Cl. 285—9)

1. The combination in an angular pipe joint, of a nipple located at one end of the joint body and having an exterior tapered packing head, a complementary seat in the joint for said head, journal bearings in the joint for said nipple, said nipple having ports near its inner end opening to the interior of the joint body, a spring-head on the inner end of the nipple, a flanged nut closing the other end of the joint body and an adjusting disk in said nut, a spring interposed between the spring-head and said disk, and an adjusting bolt threaded through the nut and engaging said disk.



2,101,938

LUBRICATED SWIVEL PIPE JOINT

Chipman H. Giberson, Elyria, Ohio

Application September 1, 1937, Serial No. 162,019
2 Claims. (Cl. 285—9)

2. The combination in a swivel pipe-joint with a sleeve having a conical seat, of a nipple swiveled in the sleeve and an exterior conical shoulder on one end of the nipple fitted in said seat, a hollow head rigid with the other end of said nipple, a journal bearing rigid with the head and located in said sleeve, and a compressed spring coiled about the nipple and interposed between said journal bearing and a portion of the sleeve.

2,101,939

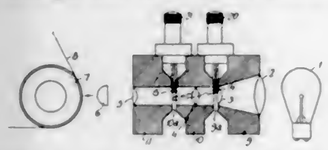
COOKING OR EXTRACTING PROCESS

Max Groeck, Berlin, Germany, assignor to Hydro-Groeck G. m. b. H., Berlin, Germany

No Drawing. Application May 21, 1937, Serial No. 143,976. In Germany February 26, 1935
7 Claims. (Cl. 99—100)

1. The process of cooking or extracting foodstuffs such as vegetables and of preparing beverages by boiling with water, which comprises introducing into the mixture of substances used in the cooking or extracting process a bisulfate of an alkali metal which is capable of rendering alkaline earth metal salts soluble in the boiling water and of preventing the mineral matter present in the raw material from being extracted during boiling.

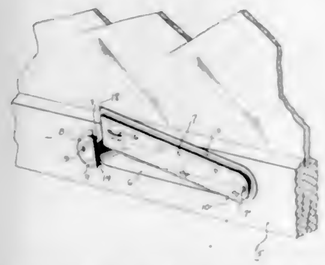
2,101,940



OSCILLOGRAPH

Sven Severin Hansen and Terrence Max Emil Wendt, Rasunda, Sweden

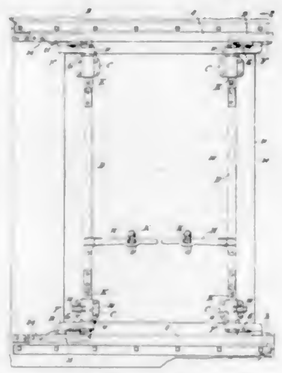
Application October 7, 1935, Serial No. 43,950
In Sweden October 22, 1934
6 Claims. (Cl. 88—61)



1. In a light valve for recording sound on a film, a source of light, two light intercepting or

screening elements adapted to oscillate in accordance with the sound to be recorded, separate magnetic fields for said elements, and means to form

an image of one element substantially in the plane of the other element, whereby one element and the image of the other form a light slot for controlling a beam of light from said source.



2,101,941
STORM SASH VENTILATOR
William C. Hansen and Henry J. Goelzer, Milwaukee, Wis.
Application July 1, 1936, Serial No. 88,280
5 Claims. (Cl. 98—97)

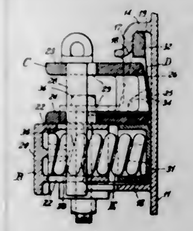
1. A closure for ventilator openings formed in one rail of a storm sash, comprising a member formed entirely of sheet metal and of a size to close the ventilating opening, means pivotally mounting said member on said rail of the storm sash for edgewise movement in a plane parallel to the surface of the rail to and from a position closing the opening, a stop member secured to said rail of the sash to coact with the free end of said pivoted member to hold the same in closed position, and the free end of said pivoted member and said stop having engaging portions lying substantially on planes parallel to the surface of the rail, one of said engaging portions being adapted to be sprung against spring tension upon engagement of said portions whereby the closure member is firmly held in its closed position.

2,101,942
REFRIGERATOR CAR DOOR
Stacy B. Haseltine, Glen Ellyn, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Application June 1, 1936, Serial No. 82,806
17 Claims. (Cl. 20—23)

1. In a door construction for refrigerator cars having a wall member provided with a door opening, the combination with a door adapted to close said opening; of a guide track on said wall member; a carrier slidably guided on said track; a rotary operating shaft mounted on said door; keeper means on said carrier; keeper engaging means on said shaft engageable with the keeper means to either force the door tightly closed or pry the same open; and a swinging supporting arm pivoted at one end on said carrier and having the other end journaled on said shaft for ro-

tation with respect to said shaft about an axis coincident with the axis of said shaft.

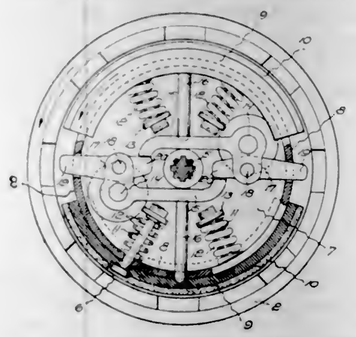
2,101,943
METHOD OF MANUFACTURING YARNS
Wilhelm Hollerung, Kulmbach, Germany, assignor to Kulmbacher Spinnerei, Kulmbach, Germany, a corporation of Germany
No Drawing. Application November 30, 1935, Serial No. 52,421. In Germany December 3, 1934
5 Claims. (Cl. 117—21)



1. The method of manufacturing compound yarns having the suppleness, elasticity, and the loose, pliant feel of wool, which comprises first over-twisting one or more core threads, normally twisting one or more covering threads, and finally wrapping said core threads with said covering threads, the tendency toward recovery of the overtwisted core component serving to somewhat contract or shrivel said compound yarn.

2,101,944
CONDENSATION PRODUCT AND PROCESS OF PRODUCING SAME
Herbert Hönel, Vienna, Austria, assignor to Helmuth Reichhold, Detroit, Mich., doing business as Reichhold Chemicals
No Drawing. Original application December 20, 1934, Serial No. 758,502. Divided and this application October 7, 1935, Serial No. 43,987
5 Claims. (Cl. 260—4)

1. A process of producing solid heat hardening soluble resinous condensation products which comprises condensing by the aid of an alkaline catalyst, an excess of formaldehyde over the equimolecular proportion with a phenol in which two of the particularly reactive positions are unoccupied and which carries at least one ethyl group as substituent per each phenolic hydroxyl group present in the molecule.



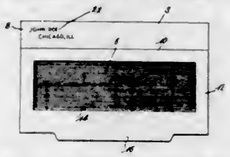
2,101,945
DRAFT AND BUFFER GEAR
George A. Johnson, Chicago, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Application June 2, 1933, Serial No. 673,983
14 Claims. (Cl. 213—9)

3. In a combined draft and buffer gear for cars, the combination with a buffer head at the end of the car supported for movement inwardly toward the car; of shock absorbing means opposing inward movement of said head; an upright swinging lever; means pivotally supporting said lever at one end and holding the same against upward displacement, said lever having the opposite end portion thereof engaging the shock

absorbing means to compress the same during outward movement of the lever in draft; fixed abutment means for holding said last named end portion of the lever against inward movement during a buffing action of the gear; and a draft member pivotally connected to the lever between the ends of the latter.

2,101,946
CENTRIFUGAL CLUTCH FOR ROTATING MACHINE ELEMENTS
Gustaf Emil Jonsson, Huddinge, Sweden
Application August 20, 1935, Serial No. 37,068
In Sweden September 11, 1934
2 Claims. (Cl. 192—105)

1. In a centrifugal clutch for rotating machine elements, a first clutch member comprising a disc affixed to one of the machine elements, a supporting ring turnably mounted on said disc, a number of clutch segments mounted exteriorly on said ring and radially displaceable in relation thereto, spring means acting on the clutch segments and adapted to displace the same inwardly towards the outer face of said ring in counteraction of the centrifugal force, a number of two-armed levers supported by said disc, one arm of each lever extending through an opening in said ring, the other arm being adapted by suitable intermediate means to exert an outward force on a clutch segment when the ring is rotated relatively to the disc, and a second clutch member affixed to the other machine element and provided with a clutch surface for frictional engagement with the clutch segments.



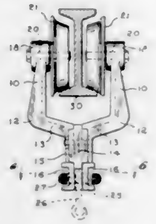
2,101,947
COHERENT POROUS ZIRCONIUM SILICATES
Charles J. Kinzie, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine
No Drawing. Application July 29, 1933, Serial No. 682,795
10 Claims. (Cl. 106—9)

1. The method of making porous zirconium silicates which comprises mixing natural zircon grains with an aqueous solution of a zirconium and silicon containing salt, adding an ammonia vapor to aid in setting the mixture, shaping the mixture to form, and then burning same at temperatures between 800° and 1500° C.

2,101,948
SYNTHETIC RESIN
Felix Lauter, Evanston, Ill., assignor to Sealkote Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application December 7, 1935, Serial No. 53,430
4 Claims. (Cl. 260—8)

1. Method of producing a resinous reaction product which will remain in solution with cellulose acetate for the production of a stable and transparent film and is practically water white and when dissolved in acetone or ethyl acetate or both is miscible in all proportions with cellulose acetate that comprises heating an admixture of about 296 parts by weight of phthalic anhydride and about 184 parts of glycerine in an air tight container equipped with a sealed reflux condenser, agitating the mixture when it reaches a fluid state and then adding about 2 parts of lactic acid as a catalyzing agent, heating the mass for about 2 hours at a temperature not higher than 160° C. and concentrating and distilling in an open vessel at a temperature not to exceed 245° C.

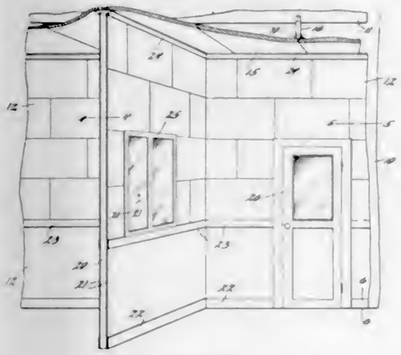
2,101,949
ADDRESSING STENCIL
Neil D. Luckie, Miami, Fla.
Application May 16, 1935, Serial No. 21,858
6 Claims. (Cl. 101—127)



1. An addressing stencil comprising, a body portion having forward and rear flaps, a stencil strip associated with one flap of the body portion, and a spacing member having two flaps provided with openings associated on opposite sides with the stencil strip flap to expose said strip through the openings thereof and to present thickness on each side of the strip to normally prevent contact thereof with a flat surface.

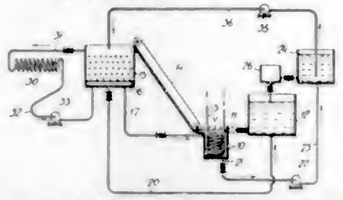
2,101,950
PREPARING METAL FOR ENAMELING
George W. McGohan, Middletown, Ohio, assignor to The American Rolling Mill Company, Middletown, Ohio, a corporation of Ohio
No Drawing. Continuation of application Serial No. 675,645, June 13, 1933. This application March 21, 1934, Serial No. 716,674
6 Claims. (Cl. 148—7)

1. A process of preparing iron or steel for vitreous enameling which consists in coating the



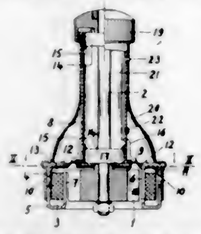
metal with a heat decomposable salt of an adherence enhancing metal, heating the metal to decompose the salt and form a thin coating of the adherence enhancing metal alloyed with the iron or steel and acid treating the product, said metal being nickel.

2,101,951
TROLLEY YOKE
Colin Herbert McInnis, Windsor, Ontario, Canada
Application June 30, 1936, Serial No. 88,195
4 Claims. (Cl. 198—177)



1. A carrier trolley for conveyor chains including oppositely disposed brackets having their lower ends engaged in a link of the conveyor chain, a spacing block disposed between the lower ends of said brackets having laterally projecting lugs at each end adapted to engage over the sides of said brackets and secure the same in parallel alinement and means securing said spacing block and brackets together.

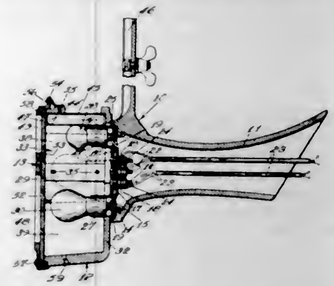
2,101,952
BUILDING CONSTRUCTION
Anders Christian Olsen, Garden City, N. Y.
Application February 14, 1935, Serial No. 6,565
42 Claims. (Cl. 72—1)



1. An interior covering structure for buildings comprising, in combination, spaced wall and ceiling members, at least the exposed ones of which are composed of a plurality of panels, spacing and connecting elements between said spaced wall and ceiling members comprising elongated main supporting members substantially T-shaped in cross section, other elongated members also T-shaped in cross section interlocked with said first named members and with the margins of adjacent panels.

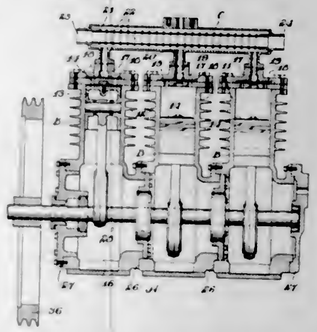
2,101,953
METHOD AND APPARATUS FOR PRODUCING COLD
Erik Oman, Stocksund, Sweden
Application September 12, 1936, Serial No. 100,546
In Sweden September 21, 1935
15 Claims. (Cl. 62—95)

1. A method of producing cold in refrigerating plants which operate at varying load, comprising subjecting a solution of a substance in a solvent to a temperature below its freezing point by means of excess of cold at disposal at low load, thereby causing solvent to be transferred into solid phase in the form of crystals, separating solid phase from the solution, transferring at high load such separated solid phase into liquid phase, and utilizing the cold thus produced.



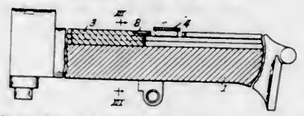
2,101,954
BICYCLE LIGHTING GENERATOR
Paul Rathmann, Podmokly, Czechoslovakia, assignor to Elektrotechnische Fabrik Schmidt & Co., Gesellschaft m. b. H., Podmokly, Czechoslovakia, a limited liability company of Czechoslovakia
Application February 10, 1937, Serial No. 125,107
In Czechoslovakia February 15, 1936
3 Claims. (Cl. 171—209)

1. In a bicycle lighting dynamo in combination, a rotary pole magnet, a cage of C-shaped cross-section surrounding said magnet, tongues formed on the inner wall of said cage serving as armature poles, a spindle, one end of which is fixed in said magnet, a drawn tube mounted on said cage, a flange projecting from the end of said tube, the circumferential edge of said flange fitting exactly the inner surface of the outer wall of said cage, bearings supporting said spindle in said tube and means for preventing displacement of said tube relative to said cage.



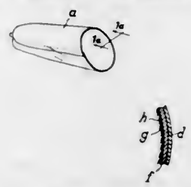
2,101,955
INDICATOR
Alden G. Rayburn, Sausalito, Calif.
Application February 21, 1934, Serial No. 712,389
6 Claims. (Cl. 177—327)

4. A vehicle signaling device comprising a housing having open ends; a hollow sleeve adapted to surround the opening in one end of said housing and support the device; an inwardly directed peripheral shoulder in said sleeve; a contact carrying member disposed in said sleeve; a plurality of contact posts disposed centrally of said contact member and said sleeve; a plurality of electrical conduits disposed in said sleeve adapted to connect said posts with a source of energy and designed to be independently energized under predetermined conditions; a socket member having a plurality of sockets adapted to be clamped between said housing and said sleeve;



a bulb in each socket; individual spring contacts biased away from said contact carrying member and connecting each of said posts with a predetermined bulb, said spring contacts resiliently urging said contact carrying member against said shoulder when said bulbs are in place in said sockets; and means for clamping said sleeve and said housing and retaining said socket member and said contact carrying member in proper operating position.

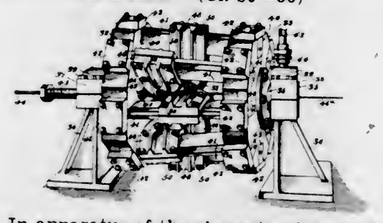
2,101,956
SECTIONAL REFRIGERANT COMPRESSOR
Edward J. Sailstad, Minneapolis, Minn., assignor to Van Duyne-Moran Fixtures, Co., St. Paul, Minn., a corporation of Minnesota
Application January 22, 1934, Serial No. 707,747
2 Claims. (Cl. 230—184)



1. A refrigerant compressor including, the combination of unitary compression cylinders and crank case portions, means for connecting one or more similar unit compressing cylinders and crank case portions, eccentric straps, pistons in said cylinders connected to said straps, a crank shaft for all of the cylinders, bearings mounted between said units, enlarged shaft portions engageable in said bearings and eccentrics on said shaft of substantially equal size to said enlarged portions to permit said eccentric straps and bearings to be made in one piece.

2,101,957
RECOIL LOADING FIREARM
Thomas Frederick Sanders, Slough Trading Estate, England, assignor to Sanders Small Arms, Limited, London, England
Application February 23, 1937, Serial No. 127,239
In Great Britain February 26, 1936
8 Claims. (Cl. 42—4)

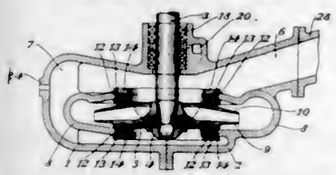
1. A bolt locking arrangement for a recoil loading firearm comprising a breech casing, a part not participating initially in the recoil, longitudinal guiding means between the said part and the breech casing, a breech bolt slidably mounted in the breech casing, a bolt locking member pivoted on the breech casing on a substantially central axis perpendicular to the longitudinal axis of the gun, and a lateral surface on the locking member located to contact with the part not participating initially in the recoil and so rocks the locking member.



2,101,958
ARTIFICIAL SAUSAGE CASING AND PROCESS FOR MAKING SAME
Gustav Sachsenröder, Wuppertal-Barmen, Allee, Germany
Application May 23, 1934, Serial No. 727,074
In Germany December 7, 1932
14 Claims. (Cl. 99—176)

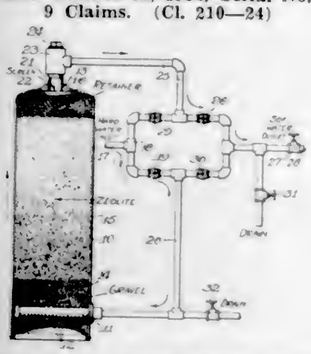
1. A sausage casing of hydrated fibrous paper which is hydrated to such a degree that its lateral extensibility at the periphery of the casing in the wet state exceeds 25 per cent.

8. A sausage casing of hydrated fibrous paper according to claim 1, which is so strongly hydrated that it has a skin-like translucent consistency.



2,101,959
METAL DRAWING APPARATUS
Walter F. Schulz, Youngstown, Ohio, assignor of one-half to Julius Kahn, Youngstown, Ohio
Application August 16, 1933, Serial No. 685,479
24 Claims. (Cl. 80—36)

1. In apparatus of the character described, the combination with a supporting structure having means for admitting stock thereto and the exit of

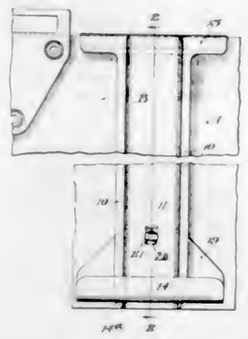


the altered product therefrom, of a plurality of carrier members extending longitudinally along and on different sides of the path of the stock in the supporting structure, said carrier members being disposed in convergent relation, carriages movable longitudinally along the carrier members, and die elements mounted on and movable with the carriages, die elements being thereby movable to varied spaced relations, means for fixing the carriages at different points on the carriers, and means for drawing stock between the die elements when fixed in their adjusted positions.

2,101,960
CENTRIFUGAL PUMP
Erik Albert Alexander Sjöström, Gothenburg, Sweden
Application January 21, 1936, Serial No. 60,098
In Sweden February 11, 1935
4 Claims. (Cl. 103—111)

1. A centrifugal pump having an impeller comprising disks and a number of blades provided between said disks and having passages provided between them, a central inlet opening in one of said disks leading to said passages, ducts in said last mentioned disk beginning at an inner portion of the disk and ending at a part of said disk more remote from the center of the disk than said inner portion, said ducts having at least along some part of their length substantially the same direction as the passages between the impeller blades, and sealing means between the suction side and the pressure side of the impeller, said ducts communicating at their outer ends with said sealing means and at their inner ends with said central inlet opening.

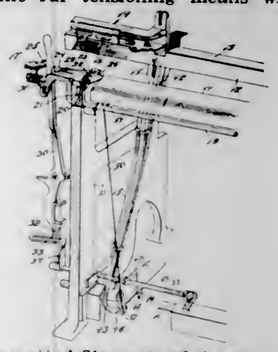
2,101,961
TREATMENT OF WATER
Kemper Slidell, Madison, Wis., assignor to C. F. Burgess Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application October 31, 1934, Serial No. 750,882
9 Claims. (Cl. 210—24)



7. Apparatus for treating liquid comprising a container, a mass of particles of treating material in said container, bottom and top connections from said container whereby said liquid may flow upwardly through said mass, said particles being only slightly heavier than the liquid, whereby the upward flow thereof, in the absence of restraining means, would carry said particles out of said container, and a floating screen in said liquid above said mass composed of irregularly shaped lighter particles of hard material, in the surface pits of which said first mentioned particles are caught temporarily and are subsequently dislodged and sink in said liquid.

2,101,962
METHOD OF MAKING FRUIT EXTRACT CONCENTRATES AND FLAVORS
William E. Stokes, Brooklyn, and Margaret H. Kennedy, New York, N. Y., assignors by mesne assignments, to Standard Brands Incorporated, New York, N. Y., a corporation of Delaware
No Drawing. Application February 18, 1936, Serial No. 64,470
9 Claims. (Cl. 99—22)

1. A method of making fruit extract concentrates and flavors comprising steeping fruit substance in a cool acidulated menstruum to obtain an extract, the acid content of said menstruum being sufficient in amount to cause said extract to have a pH value of between about 2 and no greater than 2.5.

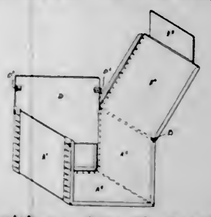


2,101,963
PANEL AND CARD CARRIER COMBINATION
Frederick L. G. Straubel, Green Bay, Wis.
Application March 31, 1937, Serial No. 134,132
19 Claims. (Cl. 129—16.7)

4. In combination, a panel to be placed in the filing space of a drawer, a card carrier having means at its upper end for yieldingly embracing the top edge of the panel to normally hold the panel and carrier assembled, and a card support detachably mounted on the lower portion of the carrier.

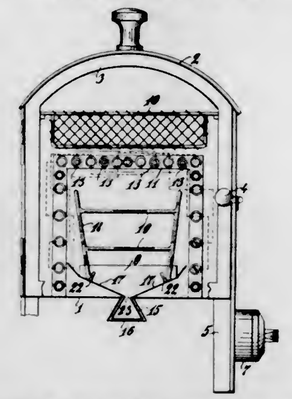
2,101,964
METHOD AND APPARATUS FOR RESTORING FUR IN A SHUTTLE TO ACTIVE POSITION
William A. Tebo, Anthony, R. I.
Application March 10, 1937, Serial No. 130,094
11 Claims. (Cl. 139—225)

1. The method of restoring a fur tensioning means in a shuttle to active position, which consists in forcibly passing a gas in a direction relative to the fur tensioning means whereby to



cause all matted filaments of the fur to be separated and lifted into natural active position.

2,101,965
METAL PANEL
Clyde C. Trees, White Plains, N. Y., assignor to Medallic Art Company, New York, N. Y., a corporation of Delaware
Application July 16, 1937, Serial No. 153,923
10 Claims. (Cl. 40—63)



1. In a display panel, the combination of a back plate, spaced parallel side rails on said back plate having inwardly opening channels therein, a top rail abutting the side rails and closing one end of the channels, a tray slidably mounted in said channels, replaceable name plates slidably mounted on said tray and a lock bar detachably connected to the back plate by a pin and keyhole slot connection and engageable with the lower end of the side rails and the tray to retain the tray in the side rails.

2,101,966
MANUFACTURE OF BOXES
Alexander Gerard Anton van den Bogaert, Surbiton, England, assignor to No-Nail Cases Proprietary Limited, London, England, a limited liability company of Victoria, Australia
Application June 27, 1935, Serial No. 28,755
In Great Britain July 3, 1934
1 Claim. (Cl. 229—23)

A box comprising end members, a body member in a continuous sheet creased transversely so that it will readily fold into a bottom, two sides and a top, continuous metallic reenforcing strips each having a body portion provided with teeth and a flat border flange extending at right angles to the body portion of said strips and on the same side thereof as the teeth, said strips being fixed to the outer surface of the longitudinal edges of said body member with their flanges opposite and spaced from such edges, the teeth of said metal reenforcing strips extending through the longitudinal edge portions of said body member, the edges of said body member cooperating with the inner surface of said flanges of the metal reenforcing strips to form continuous channels to receive the respective end members, the said body member being slotted at each edge on the line where the top portion of the body member adjoins the remainder of the body member, and said end members being provided with inturned lugs adapted to engage behind the edges of the side portions of said body member when the said end members are inserted in said continuous channels.

2,101,967
ROASTING, TOASTING, GRILLING, AND COOKING APPARATUS
Alfred Walterspiel, Munich, Germany
Application October 13, 1934, Serial No. 748,249
In Germany December 13, 1933
14 Claims. (Cl. 219—35)

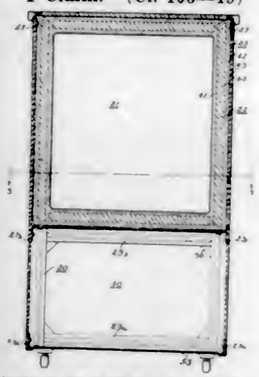
1. A cooking apparatus comprising a housing having restricted openings in the top and bottom thereof, heating means within said housing arranged in vertical parallel planes adjacent to the vertical walls of the housing, means supporting material to be heated within said planes, and heating means within said housing and arranged in a horizontal plane above said vertical heating means, the vertical and horizontal heating means forming an inverted U and the horizontal heating means being arranged below the top of the housing to allow the heat to gather below the top of the housing and the horizontal heating means, said inverted U-shaped heating means being adapted to include therein an article to be cooked and said horizontal portion thereof being adapted to heat articles placed above the same.

2,101,968
JAR
Harry P. Wickersham, Huntington Park, Calif., assignor of one-half to Erwin Burns, Los Angeles, Calif.
Application January 9, 1934, Serial No. 705,866
17 Claims. (Cl. 255—27)

1. A well tool for use in combination with a drill string including two sections related for

limited relative longitudinal movement and adapted to be secured to members of the string, a turnable sleeve movably carried by one section and receiving the other section for movement relative thereto, parts on the said other section and sleeve having faces adapted to releasably

cooperate and pitched to cause turning of the sleeve upon a tensile strain being applied to the sections, and a separate yielding means interposed between the sleeve and said other section tending to resist turning of the sleeve and disengagement of said parts.



2,101,969

SILICATE INSULATING MATERIAL

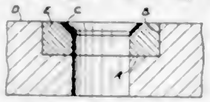
Harry M. Williams, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware

Application March 30, 1929, Serial No. 351,364

1 Claim. (Cl. 106—19)

An insulating material comprising a base of dehydrated soluble silicate.

2,101,970



VALVE SEAT

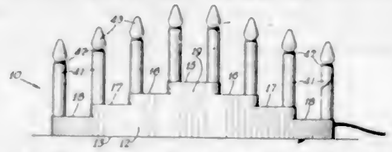
William A. Wissler, Flushing, N. Y., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

Application July 26, 1933, Serial No. 682,181

3 Claims. (Cl. 123—188)

1. In combination with an aluminum or aluminum base alloy engine element having at least one valve port therein, said element having a relatively high coefficient of thermal expansion, a valve seat secured within said port, said valve seat comprising a metal ring secured to the inner periphery of said port, a surface metal layer on said metal ring of a wear and oxidation resistant metal having a relatively low coefficient

of thermal expansion, said metal ring being of a metal having a coefficient of thermal expansion intermediate between, and substantially different from, that of said aluminum or aluminum base alloy and that of said wear and oxidation resistant surface metal.



2,101,971

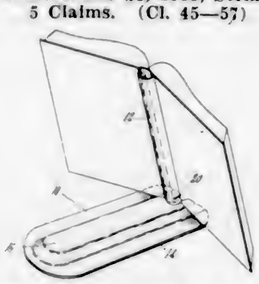
ELECTRICAL ILLUMINATING DEVICE

Abraham Wolf, Brooklyn, N. Y., assignor to Noma Electric Corporation, New York, N. Y., a corporation of New York

Application June 14, 1934, Serial No. 730,563

10 Claims. (Cl. 240—10)

2. A chandelier comprising an elongated base made of flexible, resilient sheet metal and being curved, and a member interconnecting the outer ends of said base for maintaining the same in curved position, and a plurality of candle simulating members mounted on said base, lamp sockets on said candle simulating members interconnected by wiring passing through said candle simulating members, in series circuit, said interconnecting member being extensible whereby the curvature of said base may be changed.



2,101,972

BOOK SUPPORTER

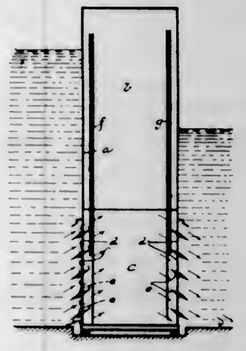
Leon Zocchi, Milford, Mass.

Application December 23, 1935, Serial No. 55,741

5 Claims. (Cl. 45—57)

1. A book stand comprising an elongated hollow base having a short slot near an end thereof, a substantially cylindrical rod freely slidable through said slot, said rod having an enlarged portion adjacent to its inner end adapted to cooperate with the sides of the slot to support the rod in an inclined position overhanging said base when the rod is pulled out of said base for cooperation with said portion.

2,101,973



DOUBLE WALLED SLUICE GATE

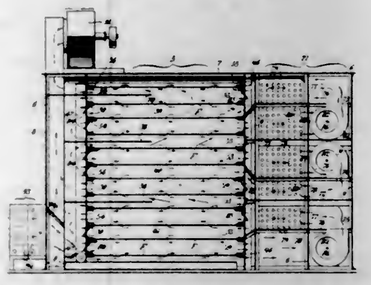
Theodor Becher, Wiesbaden, Germany, assignor to Maschinenfabrik Augsburg-Nurnberg A. G., Nuremberg, Germany, a corporation of Germany

Application January 27, 1936, Serial No. 60,979

In Germany February 11, 1935

2 Claims. (Cl. 61—22)

1. In a double walled sluice gate, in combination with the walls having apertures therein to permit water to flow through the enclosed inner space from one side of the gate to its other side, movable members provided in said apertures for closing the same, and means operatively associated with said members for moving them to various angular positions.



2,101,974

FABRIC TREATING MACHINE

Harold H. Belcher, Philadelphia, Pa., assignor to The Philadelphia Drying Machinery Company, Philadelphia, Pa., a corporation of Pennsylvania

Application July 13, 1931, Serial No. 550,443

8 Claims. (Cl. 34—48)

1. A machine for drying fabrics in lengths comprising an elongated housing affording a plurality of superposed contiguously intercommunicating drying zones; means for directing fabric in longitudinal horizontal runs through the several drying zones; and means coacting with the fabric runs to circulate and recirculate the air in transverse circuits back and forth across the several drying zones, with passes of the air oppositely in the top and bottom of each zone in contact with opposite sides of a run of fabric therein, and with reverse air flow in the circuits of adjacent zones, so that the flow in the intercommunicating contiguous passes of adjacent zones is in the same direction.

2,101,975

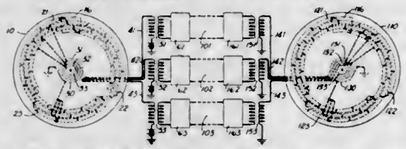
REFINING LEAD

Jesse O. Betterton and Yurii E. Lebedeff, Metuchen, N. J., assignors to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application September 26, 1936, Serial No. 102,815

6 Claims. (Cl. 75—78)

1. The process for debismuthizing lead containing alkaline earth metals in amounts insufficient to effect any substantial reduction of the bismuth content of the lead but sufficient to permit the formation of a fixed compound or product of antimony, bismuth and alkaline earth metals which comprises slowly incorporating an amount of antimony equal to approximately six times the bismuth content of the lead into a bath of the lead within a minimum working temperature range, cooling the bath to freezing and separating the liquid metal and frozen crust thereby effecting substantially complete removal of bismuth from the lead.



2,101,976

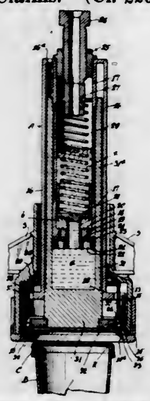
TELEVISION SYSTEM

Otto B. Blackwell, Plandome, N. Y., and Joseph Herman, Westfield, N. J., assignors to American Telephone and Telegraph Company, a corporation of New York

Application September 18, 1929, Serial No. 393,568

14 Claims. (Cl. 178—6)

1. The method of limiting the frequency range required for each channel in multi-channel electro-optical transmission which comprises concurrently and repeatedly scanning the entire area of the same field of view for the different channels, a scanning of a given elemental area for each channel taking place later than a scanning of that area for a different channel by a period approximately equal to each scanning period divided by the number of channels.

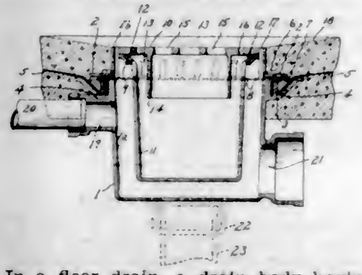


2,101,977

MACHINE FOR APPLYING CLOSURES

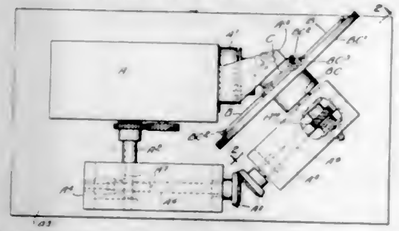
Samuel C. Bond, Holly Oak, Del.

Application June 29, 1935, Serial No. 29,018



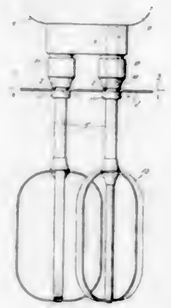
15 Claims. (Cl. 226—86)

3. In a machine for applying a closure to a



container, a support for the container, a contractile ring, means for contracting said ring to apply a substantially constant pressure to the closure, said means being operated by relative movement between the container and ring in one direction, said pressure being wholly released upon relative movement in the other direction.

2,101,978
FLOOR DRAIN
Edward W. N. Boosey, Detroit, Mich.
Application August 7, 1936, Serial No. 94,842
8 Claims. (Cl. 182—31)

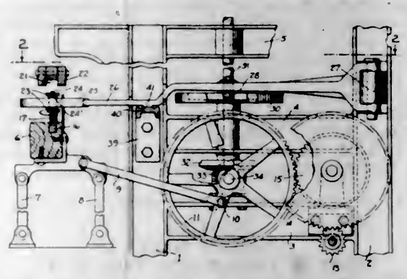


1. In a floor drain, a drain body having an open upper end and an outlet at the bottom, a grating supported at the upper end, a sediment intercepting trap comprising a basket supported centrally in relation to the grating and of less area than the grating, a skirt depending from the grating into the basket and having an open lower end, said basket having apertures in its wall above the lowermost point of the skirt and providing for a flow of material from the basket into the drain body, said grating having a series of apertures within the area defined by the skirt, and a series of apertures outside the area of the skirt providing for a flow of liquid through the grating into the drain body, the combined area of said last named apertures being less than the combined area of the apertures opening to within the skirt.

2,101,979
STEREOSCOPIC PHOTOGRAPHY
Norman H. Brock, Philadelphia, Pa.
Application February 6, 1933, Serial No. 655,360
Renewed May 8, 1937
5 Claims. (Cl. 88—16.6)

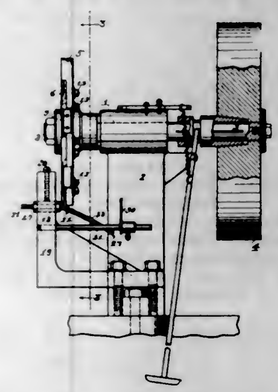
1. In making pictures of a scene for screen projection so that a screen observer may visually combine different pictures of said scene and thereby obtain a stereoscopic effect, the improvement which consists in reflecting images of said scene through a taking camera lens from parallel mirror planes separated by a distance of not more than two-tenths of an inch but large enough to produce a significant difference in the relative positions of the same scene points in the images reflected from the different planes onto successively exposed portions of a camera film and forming a projection film from said camera film by a photographic reproduction process which includes the step of modifying the scale of the images of the set reflected from one plane to minimize scale differences between the sets of images reflected by the different planes, and the step of shifting the images of one set laterally of the projection film relatively to the images of the other to thereby minimize the lateral displacement of different viewpoints of the same scene points.

2,101,980
GUARD ATTACHMENT FOR MIXING MACHINES
Lillian B. Brunner, Shaker Heights, Ohio
Application April 1, 1937, Serial No. 134,370
4 Claims. (Cl. 259—1)



1. For use with a mixing machine incorporating a mixer spindle provided with a shoulder and a shank therebeyond, the machine including a socket member into which said shank is adapted to be releasably engaged; a guard attachment consisting of a solid flat plate devoid of protuberances and having an aperture whose diameter is slightly greater than that of the shank and through which the shank is adapted to be inserted thereby to dispose the guard attachment between the shoulder and the end of the socket member, the guard attachment being sustained in position by said shoulder and including a part arranged for cooperation with a part of the machine whereby the guard is held stationary when the spindle is rotating.

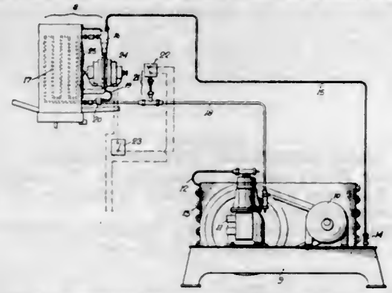
2,101,981
SHUTTLE DRIVING MECHANISM FOR LOOMS
William E. Burns, West York, and Eugene N. Miller, York, Pa., assignors to York Narrow Fabrics Co., York, Pa., a corporation of Pennsylvania
Application July 17, 1936, Serial No. 91,118
3 Claims. (Cl. 139—136)



1. In combination, a swinging batten, a shuttle actuating member carried thereby and slidable therealong, a guide on end end of the batten, a slide slidable therein and connected to said shuttle actuating member, a lever pivoted to swing in a horizontal plane and operatively connected at one end to said slide to move said slide and member along the batten, said connection permitting oscillation of said slide with respect to said lever, a horizontal bearing for said lever intermediate its connection to said slide and

said cam, a cam for oscillating said lever, and

means for driving said batten and lever in timed relation.

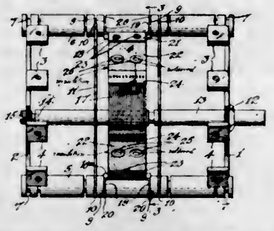


2,101,982
MACHINE AND METHOD FOR FORMING HELICAL SPRINGS
Raymond F. Carlberg, Grand Rapids, Mich.
Application February 11, 1937, Serial No. 125,206
13 Claims. (Cl. 140—103)

1. A machine of the class described for successively forming helical springs from longitudinally fed helical spring work, comprising: a guide for a portion of the longitudinally fed work; an element having a movement transverse the work; a member carried by said element for severing from said portion a free end portion of the work to constitute one of said helical springs; a member carried by said element for bending over an end part of one of said portions to constitute a mounting part of one of said helical springs.

2,101,983
FAN ECONOMIZER
William Carpender, New Brunswick, N. J., assignor, by mesne assignments, to Carrier Corporation, Newark, N. J., a corporation of Delaware
Application August 8, 1934, Serial No. 738,950
8 Claims. (Cl. 62—4)

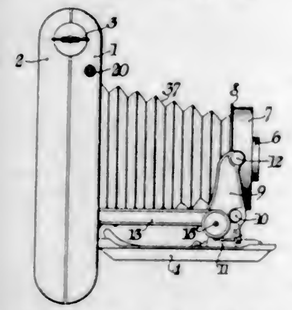
1. A method of conditioning the air in a refrigerator, consisting in supplying refrigeration effect to the air within the refrigerator, so that a desired air temperature will be maintained therein, actively circulating air in the refrigerator when the temperature of the refrigerant used is below a predetermined maximum and eliminating the active circulation of air when the temperature



of said refrigerant exceeds the predetermined maximum.

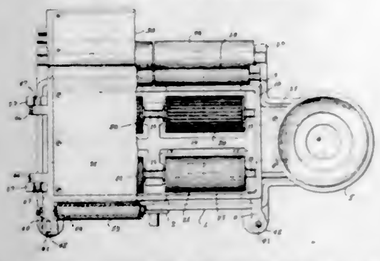
2,101,984
TREATMENT OF CELLULOSE ESTERS TO RENDER SUITABLE FOR MOLDING
Frederick R. Conklin and Charles L. Fletcher, Kingsport, Tenn., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application July 3, 1936, Serial No. 88,834
6 Claims. (Cl. 260—102)

1. A process for preparing an organic acid ester of cellulose having a precipitation value of approximately 60–70% which comprises subjecting an organic acid ester of cellulose to the action of ¾–2% of sulfuric acid at 90–150° F. in its acetic acid solution in which the acetic acid is 1½–7 times the amount of the ester and then treating the product with a bath containing water in an amount 30–70% of the weight of the ester and an amount of sulfuric acid ⅛–2% of the weight of the ester until a precipitation value of 60–70% is reached.



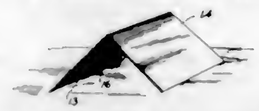
2,101,985
ELECTRICAL CONDENSER
Stanley S. Cramer, Haddon Heights, N. J., assignor to Radio Condenser Company, Camden, N. J.
Application May 9, 1934, Serial No. 724,688
23 Claims. (Cl. 175—41.5)

1. An electrical condenser comprising at least one stator and rotor set of elements; a lightweight, high rigidity, non-warping frame for supporting said elements in close cooperative predetermined and non-drifting relationship, including rigid metal end bearing plates for supporting a shaft carrying the rotor plates, means for securely holding said bearing plates in nonwarping operative position including a plurality of metallic rods of a material and size as defined herein and disposed at least one on each side of the shaft, said rods at their extremities and the end plates having cooperative formations force-



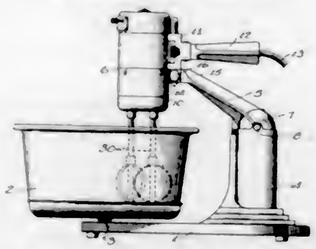
fitted together in gripping engagement across a portion of the rods reduced in diameter as well as on opposite sides of said end plates adjacent said reduced rod portions, which latter engagements comprise gripping surfaces of relatively large lateral area for the purposes described.

2,101,986
SELF-ERECTING FRONT CAMERA
Chester W. Crumrine, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application April 1, 1937, Serial No. 134,371
7 Claims. (Cl. 95—40)



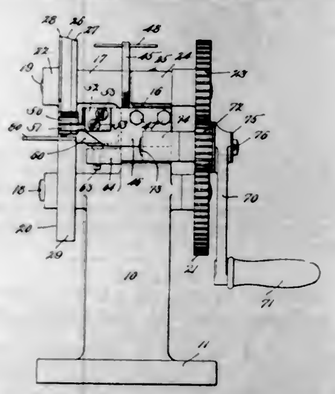
1. A folding camera of the self-erecting front type comprising, in combination, a camera body, a bed hingedly attached thereto, a lens board, arms supporting said lens board hingedly attached to the bed and lens board, braces pivotally attached to the camera body and arms for moving the camera parts to and from an erect picture taking position, a latching mechanism for retaining the camera parts in an erect or picture taking position comprising a latching member on the camera bed, latching elements on the lens board and lens board supporting arms adapted to be engaged by cooperating latching elements on said latching member moveably mounted on the camera bed and spring pressed toward an operative latching position.

2,101,987
PROCESS OF TREATING TEXTILE FABRIC FOR REINFORCING INSOLES
Elmer A. Ellis, Medford, Mass.
Application August 16, 1934, Serial No. 740,090
1 Claim. (Cl. 12—146)



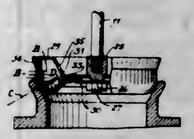
That improvement in the method of reinforcing insoles by applying fabric thereto, which consists in conducting a continuous strip of uncoated and unsized fabric thru successive treating and drying operations as an immediate step in applying the reinforcing to insoles, said treating and drying being in immediate sequence as a substantially simultaneous action at relatively high speed, said treating consisting of applying a liquid sizing and adhesive to one surface only of the fabric strip, and thereupon reversing the line of travel of the now-treated strip, and conducting the same with the untreated surface in contact with a heated plate, whereby the fabric is treated, partially dried, and rendered tacky for immediate use in reinforcing insoles.

2,101,988
INSECT BAIT
Harry M. Epstein, New York, N. Y.
Application January 25, 1936, Serial No. 60,813
3 Claims. (Cl. 43—131)



1. A bait for insects comprising a sheet of material, adapted to be placed over an insect-infested spot, pointed projections upon and over its entire lower surface facing the said spot, and an insecticide imbedded between the projections leaving the points of the projections exposed for the purpose of lacerating the tongues of animals attempting to lick up the insecticide.

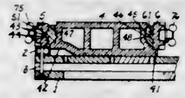
2,101,989
MIXING APPARATUS AND JUICE EXTRACTOR
Spencer Ferbend, Chicago, Ill., assignor to Chronmaster Electric Corporation, Chicago, Ill., a corporation of Illinois
Application February 10, 1937, Serial No. 124,963
3 Claims. (Cl. 259—84)



1. In a device of the class described, the combination of a casing, an electric motor and motor housing mounted in said casing, a shaft driven by said motor, a rotatable head fast on said shaft, a pair of spindles journaled on said head, both of said spindles being parallel with and equi-distant from said shaft and located at diametrically opposite points of said head, agitators fast on said spindles, planetary pinions fast on said spindles, a gear fast on the motor housing with which one of said pinions meshes, and an internal ring gear concentric with said first named gear fast on the motor housing and located in a plane laterally offset from the plane of said first named gear with which the other of said pinions meshes, whereby, as said head is rotated, said spindles are moved bodily in a common orbit and are rotatable in opposite directions on their own axes.

2,101,990
MACHINE FOR ATTACHING WELTS TO SOLES
Ernest E. Field, Brockton, Mass., assignor to Charles S. Walkup, Jr., Boston, Mass., as trustee
Application December 5, 1935, Serial No. 52,994
9 Claims. (Cl. 12—67.2)

1. In a machine of the character described, the combination of a pair of cooperating pressure rolls, one of said rolls being fixed and the other of said rolls being pivotally mounted axially for movement in relation to said fixed roll and having its face recessed to fit a welt, said recess being of less depth than the thickness of said welt, resilient means for forcing said movable roll toward said fixed roll for exerting pressure on the work and an adjustable stop for limiting the movement of said movable roll toward said fixed roll.



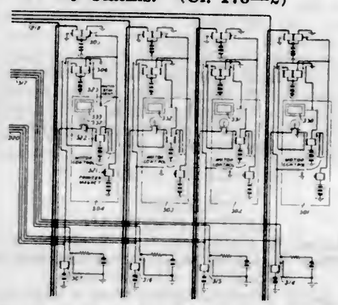
2,101,991
FLUSH TANK VALVE APPARATUS
Walter H. Finley and Charles H. Hamilton, Nashville, Tenn.
Application August 4, 1936, Serial No. 94,214
10 Claims. (Cl. 4—52)

1. A flush tank valve, comprising a pliable sealing member in the nature of a disc, adapted to engage a valve seat, and means supporting the pliable member in a manner to leave a free annular substantially unstretched portion between its outer margin and central region only and means to admit water on top of the free portion for the purpose of forcing the same toward the seat.

2,101,992
METHOD FOR MANUFACTURING COMPOSITE VITREOUS TILE AND CONCRETE STAVES
Percy C. Fish, Kalamazoo, Mich.
Application August 1, 1931, Serial No. 554,430
1 Claim. (Cl. 18—59)

The method of forming interfitting vitreous tile staves comprising forming a vitreous tile, firing it, molding a concrete tongue on one edge

and molding on the opposite edge a concrete groove adapted to receive a similar tongue.



2,101,993
REFRIGERANT MIXTURE AND THE METHOD OF USING THE SAME
Joseph Fleischer, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
No Drawing. Application April 30, 1932, Serial No. 608,574
7 Claims. (Cl. 62—178)

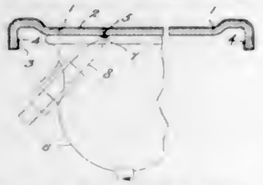
4. The process of transferring heat which comprises condensing an azeotropic mixture of sulphur dioxide and another volatile liquid and evaporating the said mixture.

2,101,994
PREPARATION OF CELLULOSE ACETATE PROPIONATE BUTYRATE
Charles R. Fordyce, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application June 26, 1936, Serial No. 87,450
4 Claims. (Cl. 260—101)

1. A process for preparing cellulose acetate propionate butyrate having a greatly predominating content of butyryl groups which comprises presoaking cellulose with a mixture of acetic and propionic acids containing 25–90% propionic acid followed by esterification of the cellulose induced by the addition of a mixture essentially consisting of butyric anhydride and an acylation catalyst thereto.

2,101,995
TELEGRAPH SWITCHING SYSTEM
Leland Adams Gardner, Maplewood, N. J., and Fred John Singer, Rockville Centre, N. Y., assignors to American Telephone and Telegraph Company, a corporation of New York
Application March 14, 1936, Serial No. 68,928
9 Claims. (Cl. 178—2)

1. In a signal transmission switching system, the combination of a plurality of sending stations, means at said sending station for transmitting outgoing signals and recording incoming signals, a plurality of receiving stations, a signal printer at each receiving station, a plurality of transmit-



ting printers common to said receiving stations, a device individual to each of said sending stations for selecting any one of said signal printers, a normally deenergized circuit extending from each of said sending stations to each of said devices, an electrical contacting device at each sending station operable for energizing one of said circuits and causing the associated selecting device to select an idle signal printer at one of said receiving stations, indicating means individual to each of said signal printers and visible to the operators of all transmitting printers for informing the operators that a sending station has been connected to an idle signal printer and that certain information is requested by the operator at the sending station whereat the call is initiated, a plurality of means associated with each of said transmitting printers for respectively connecting the transmitting printer to any one of said circuits, and means in each of said transmitting printers for transmitting the desired information over the operated circuit to the operator at the calling sending station.

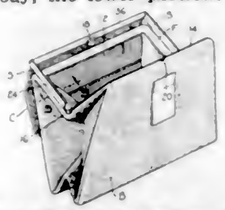
2,101,996

MANUFACTURE OF TABLE TOPS AND OTHER ARTICLES OF FURNITURE OR EQUIPMENT

Vivian Gerstenberg, Birmingham, England, assignor to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware

Application November 5, 1935, Serial No. 48,267
In Great Britain November 12, 1934
8 Claims. (Cl. 29—148)

1. The method of producing articles of manufacture including table tops constituted of a thin metal sheet and a rigid, non-porous base plate which comprises superimposing a thin metal sheet upon a rigid, non-porous metal base plate provided with an exhausting port, sealing said metal sheet and plate solely in the neighborhood of the peripheral region thereof, exhausting the air in the space between the underside of the metal sheet and the upperside of the base plate whereby the metal sheet is forced into permanent intimate mechanical engagement with said base plate throughout practically the entire surface without the occurrence of open spaces by the pressure of the atmosphere without welding of the surface of said metal sheet to the surface of said base plate, and sealing said exhausting port.



2,101,997

LADY'S HANDBAG

James E. Goldberg, New York, N. Y.

Application October 24, 1935, Serial No. 46,482
7 Claims. (Cl. 150—29)

7. A lady's handbag comprising a stiff metallic frame including two inverted U-shaped members hingedly connected at the lower ends thereof, said frame being channel-shaped in section with the open edge of the channel directed outwardly, a handbag body the edges of which are secured in the frame channel, a pocket formed on one of the outer sides of the handbag body, a flap for closing said pocket, and a pair of supports for the flap secured to one of said frame members and projecting upwardly therefrom above the top of the handbag body, the lower portions of said supports being L-shaped in section with one side secured in the channel of the frame, and the other side lying outside of the frame and covering the space between the frame members, said latter sides projecting upwardly to form supports for the flap.

2,101,998

PURIFICATION OF LACTIC ACID

Ivan L. Haag, Lakewood, and Charles A. Vana, Cleveland, Ohio, assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. **Application March 11, 1935, Serial No. 10,458**
2 Claims. (Cl. 260—122)

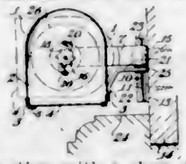
1. In a process of purifying lactic acid containing organic impurities which cause the formation of a brown ring, according to the U. S. Pharmacopoeia test for easily carbonizable matter, the step of adding to said acid a small amount of nitric acid, heating said mixture, adding to said heated acid a small amount of an activated carbon, and heating said mixture whereby the nitric acid remaining in the lactic acid is reduced to nitrogen oxides which are evolved.

2,101,999

MATERIAL FOR USE IN PREVENTING OFFSET IN PRINTING

Reinhard A. Habermaier, Toledo, Ohio, assignor to The De Vilbiss Company, Toledo, Ohio, a corporation of Ohio

No Drawing. **Application March 7, 1935, Serial No. 9,832**
1 Claim. (Cl. 134—1)



A composition of matter for preventing offset in printing consisting of substantially fifteen parts of gum arabic, forty-five parts water, forty parts denatured alcohol and one part gum tragacanth.

2,102,000

MEANS FOR RECEIVING DELIVERED COMMODITIES AND PREVENTING THEFT THEREOF

George Francis Richard Haynes, London, England, assignor of one-half to Arthur Sutcliffe, London, England

Application July 23, 1936, Serial No. 92,186
In Great Britain November 20, 1935
4 Claims. (Cl. 232—42)

1. In combination with a door element and a jamb element, a base member fastened to one

of said elements, a carrier having a detachable mounting on said base member such that it may be detached therefrom when the door is open and cannot be detached therefrom when the door is closed, a goods receiver mounted on said carrier member for rotation relative thereto in a single direction to two operative positions in one of which goods may be inserted therein and removed therefrom and in the other of which the insertion or removal of goods into or from the same is prevented by one of said elements, said goods receiver being movable from its first to its second mentioned position when the door is closed, means preventing reverse movement of said receiver, a releasable stop on said carrier to limit rotation of said receiver beyond its second mentioned position when the receiver is operatively mounted on said base member, and means mounting said stop so that it is releasable to permit rotation of the receiver from its second to its first mentioned position only when the carrier is detached from said base member.

2,102,001

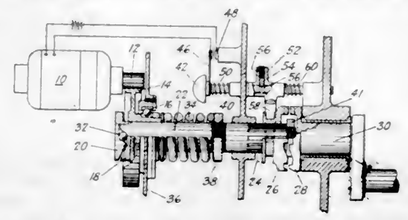
MANUFACTURE OF DRY-SEALING ENVELOPES

Vincent E. Heywood, Worcester, Mass., assignor to United States Envelope Company, Springfield, Mass., a corporation of Maine

Application July 16, 1934, Serial No. 735,326
22 Claims. (Cl. 93—61)

1. The improvement in the manufacture of envelopes, which consists in providing a blank having separate areas thereof coated with dry-sealing adhesive, next folding the blank to bring one of said adhesive coated areas into engagement with an uncoated area and then folding the remainder of the blank to bring the other adhesive coated area into overlying relation with the first area with its adhesive uppermost in the completed envelope.

9. The improvement in the manufacture of envelopes, which consists in advancing a continuous web of envelope material, applying patches of reinforcing material at intervals to the web, applying continuous bands of dry-sealing adhesive to opposite sides of the web, dividing said web into blanks, and then folding each blank into a completed envelope wiph a patch inside and with the dry-sealing adhesive bands in overlying relation, but facing oppositely.



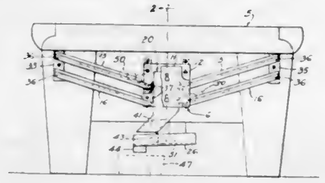
2,102,002

OVERLOAD RELEASE DEVICE

Frank Leroy Hill, Garden City, N. Y.

Application January 22, 1937, Serial No. 121,729
6 Claims. (Cl. 74—6)

1. An overload release device adapted to be introduced between a driving and a driven shaft comprising, in combination, a two-part clutch, an axially movable shaft upon which one clutch part is mounted and with respect to which it is axially movable, a cam and cam follower normally held together by spring pressure, and means mounted on said shaft and contactable with the axially movable clutch part to axially move and hence disengage it from the other said clutch part, said shaft being urged to axial movement of said contacting cam surfaces and against the action of said spring pressure should the torque load on the driven shaft exceed a predetermined value.

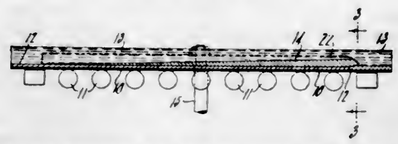


2,102,003

MULTIPLE RACK FOR POOL BALLS

Charles I. Holmes, Chino, Calif., assignor of one-half to Gilbert E. Pine, Chino, Calif.

Application September 19, 1936, Serial No. 101,636
2 Claims. (Cl. 273—10)



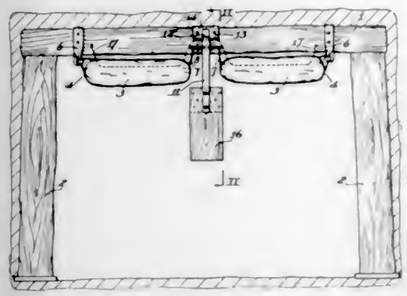
2. In a device of the kind described, a ball delivery device comprising a plurality of ball supports and a multiple gate operable with upward and downward movements simultaneously to release balls from a plurality of said supports, said gate having a downwardly directed ball delivery guide, and a ball container having an inclined bottom with a ball discharge opening through which balls are directed by said guide and towards which said balls roll along said inclined bottom, said guide operating also as a release means to deliver balls from said container through its said discharge opening, a portion of said guide intercepting the balls in said container when said gate is down.

2,102,004

PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF PAPER AND THE LIKE

Edward Hutchins, Glens Falls, N. Y., assignor to International Paper Company, a corporation of New York

Application February 19, 1935, Serial No. 7,163
4 Claims. (Cl. 92—38)

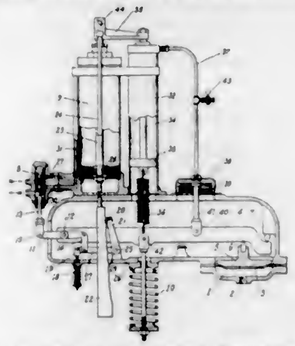


1. In a process for the manufacture of paper wherein a fibrous stock is deposited on a web forming device and subjected to drainage whereby gradually to build up a fibrous web of suitable

thickness, the steps of smoothing over that layer of fibres which is initially formed into a web as water is withdrawn from the pulp suspension, and simultaneously agitating the remainder of said stock in a direction transverse to the movement of said formed web and thereafter forming said stock with said formed web into a unitary web of fibrous material.

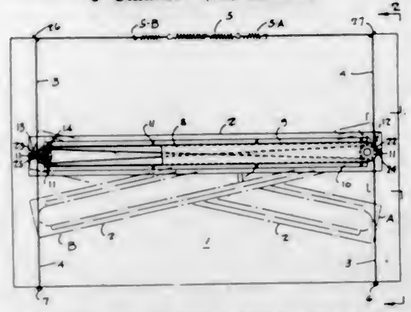
2,102,005
GEL FORMATION
Grinnell Jones, Cambridge, Mass., and Irving B. Rymph, La Grangeville, N. Y., assignors to S. Sternau & Co., Inc., New York, N. Y., a corporation of New York
No Drawing. Application July 25, 1931, Serial No. 553,232. Renewed October 26, 1937
15 Claims. (Cl. 44—7)

1. A process of forming solidified fuel which comprises dissolving a nitrocellulose in an alcoholic solvent, and solidifying the sol so formed by subjecting it to an atmosphere containing a non-solvent in a vapor state, while retaining substantially all of said alcoholic solvent in the solidified fuel.



2,102,006
ROCK DUST BARRIER
John E. Jones, Benton, Ill.
Application March 23, 1937, Serial No. 132,546
19 Claims. (Cl. 169—2)

1. A rock dust barrier comprising a bag member containing rock dust and disposed above a mine passage, a bag-opening member associated with the bag member, and means adapted to be actuated by the force of an explosion in said passage for releasing one of said members to effect relative movement of said members away from each other whereby the bag member is opened by said opening member and its contents discharged.

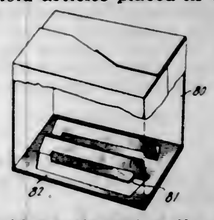


2,102,007
REGULATOR
James L. Kimball, Danvers, Mass., assignor to Ruggles-Klingemann Mfg. Co., Salem, Mass.
Application January 8, 1936, Serial No. 58,094
10 Claims. (Cl. 121—41)

1. In a regulator for the control of a condition, comprising a motor, a control element adapted to control a source of power for operating said motor, a device responsive to variations in said condition, a beam connecting said device with said control element, means associated with said motor and said beam effective upon the motor commencing to act for applying two resilient forces to said beam but in opposite directions, and

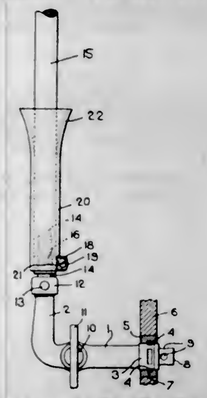
means to terminate one of the forces only upon the motor coming to rest.

2,102,008
PARALLEL STRAIGHTEDGE
Leo H. Klitsche, Los Angeles, Calif., assignor to The A. Lietz Company, San Francisco, Calif., a corporation of California
Application March 30, 1936, Serial No. 71,676
6 Claims. (Cl. 33—80)



6. In combination with a straight edge adapted to be used with a drawing board, means for maintaining the straight edge in parallel adjusted position as it traverses the board, including a pair of pulley structures respectively supported adjacent opposite ends of the member, a flexible guiding element fixed at its ends and passing around the pulley structures so as to guide the straight edge in parallel adjusted position without change in length, and means to permit variations in length of said element, whereby the inclination of the adjusted position of the straight edge may be altered.

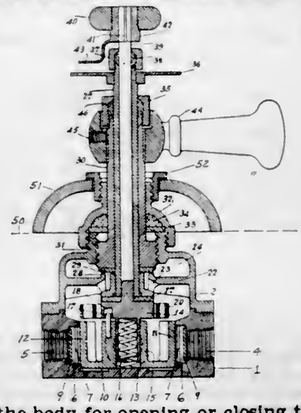
2,102,009
CARTON AND BLANK FOR FORMING THE SAME
Henry Kondolf, New York, N. Y., assignor to Southern Kraft Corporation, a corporation of Delaware
Application July 9, 1934, Serial No. 734,287
2 Claims. (Cl. 229—23)



1. An insert member for cartons and the like comprising a substantially flat body, a pair of arched article separating panels cut from said body and hinged thereto at their ends, each of said panels when bent into operative position leaving a ledge in said body adjacent said panel

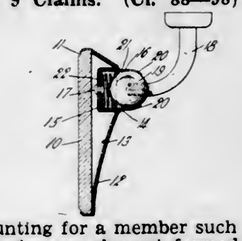
whereby to hold articles placed in the partitions

formed by said panels and walls of the carton against tilting.



2,102,010
PROTECTIVE DEVICE FOR FLEXIBLE CONDUITS
George J. Kopp, Allston, Mass.
Application January 2, 1936, Serial No. 57,144
2 Claims. (Cl. 138—61)

1. A protector for a highly flexible rubber beer hose, having one end telescopically connected to the end of a rigid fitting, comprising a seamless tubular sleeve of elastic rubber composition of much greater rigidity than said hose closely fitting, frictionally engaging and adhering to the telescoping end portion of the hose and a substantial portion thereof beyond the coupling thereby reenforcing the coupled end portion of the hose, then flaring outwardly to present a bell-mouthed end operable to prevent abrupt bending or kinking of the hose while permitting the hose to flex in a curve which will not be injurious to the material of the hose.

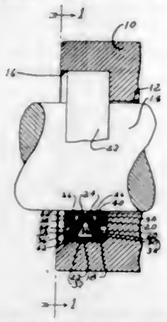


2,102,011
THERMOSTATICALLY CONTROLLED MIXING VALVE
Karl D. Kysor, Northville, Mich., assignor of one-tenth to Charles E. Wisner, Detroit, Mich.
Application January 2, 1935, Serial No. 119
10 Claims. (Cl. 236—12)

5. A valve of the character described, a body having an inlet chamber arranged for inflow of fluids of different temperatures, an outlet chamber, a wall separating the chambers and having a series of apertures and a passageway to which the apertures open providing for a flow of fluid from the inlet to the outlet chamber, said apertures being inclined in respect to the axis of the chamber whereby the fluid is passed into the passageway in angularly disposed streams whereby the fluid from the several inlets is thoroughly mixed, the outlet chamber having an aperture to which the fluids flow subsequent to mixture in the chamber, a valve means operable from the ex-

terior of the body for opening or closing the said passageway in the separating wall, and a thermostatically controlled valve for the inlets operable through expansion or contraction to vary the volume of inflow of the respective fluids.

2,102,012
SUPPORT
William La Hodny, Buffalo, N. Y.
Application January 4, 1935, Serial No. 403
9 Claims. (Cl. 88—98)



2. A mounting for a member such as a mirror which comprises an element formed for attachment against a face of said member to support it, a one-piece cup having an imperforate bottom wall, open at one end and by its bottom closed end secured to said element, so as to open in a direction away from said member, a stud extending into said cup through the open end thereof and terminating in a ball-like head, the portion of said cup around its open end being bent over said head to retain it within said cup, and resilient means confined in said cup between said head and the bottom of the cup and by its pressure on the head frictionally holding it in different angular positions into which it and said stud may be adjusted.

2,102,013
SEAL
Simpson C. Leonard, Jr., Detroit, Mich., assignor to Michigan Leather Packing Company, Detroit, Mich., a corporation of Michigan
Application April 19, 1935, Serial No. 17,195
2 Claims. (Cl. 288—1)

1. As an article of manufacture a self-contained seal for application as an assembled unit

to a housing in encompassing relation to a centrally located shaft, consisting of a centrally apertured sheet metal cup which is provided with an annular peripheral portion and substantially Z-shaped end walls, a pair of leather packings

arranged within said cup each having an axially extending flange and a radially extending flange, said packings being arranged back to back with the axially extending flanges extending in opposite directions, and a triangular spacing member arranged between said radially extending flanges.

2,102,014

APPAREL AND PARTS THEREOF

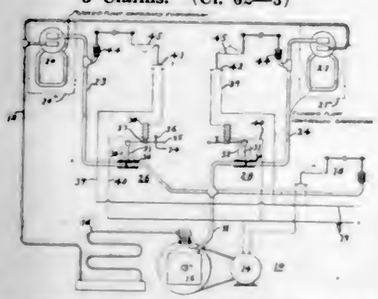
Jay H. Lind, Brooklyn, N. Y.

Application May 25, 1936, Serial No. 82,068

3 Claims. (Cl. 2—132)

1. A shirt collar comprising an outer layer, an inner layer, and an intermediate layer, said intermediate layer comprising a woven fabric having substantially horizontal and vertical intersecting rust-resisting metallic threads, and nonmetallic threads intermediate the metallic threads.

2,102,015



REFRIGERATING APPARATUS

David E. Maccabee, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware

Application September 1, 1928, Serial No. 303,598

Renewed March 22, 1933

5 Claims. (Cl. 62—3)

1. A refrigerating apparatus comprising in combination an evaporator, means for withdrawing gaseous refrigerant from the evaporator, a valve for controlling the outlet of the evaporator, means including a magnetic device for positively opening and positively closing the valve and means responsive to the pressure within the evaporator for energizing the magnetic device.

2,102,016

METHOD OF SEPARATING AN ORGANIC ACID ESTER OF CELLULOSE FROM ITS REACTION MIXTURE

Carl J. Malm and Charles R. Fordyce, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

No Drawing. Application February 13, 1935, Serial No. 6,412

12 Claims. (Cl. 260—102)

1. The method of separating an organic acid ester of cellulose from its solution in an organic solvent which comprises pouring the solution into an excess of a precipitating liquid comprising a lower aliphatic tertiary alcohol having the formula R_3COH, R representing alkyl groups.

2,102,017

FERRULE FOR CIGARETTE HOLDERS

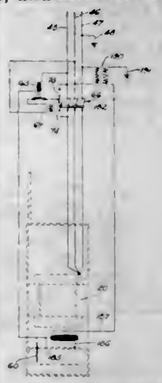
Gerould R. McWane, Sandusky, Ohio, assignor to American Sweetwood Holder Co., Ridgewood, N. J.

Application November 7, 1935, Serial No. 48,618

1 Claim. (Cl. 16—108)

A metallic ferrule comprising a cylindrical portion open at both ends and a plurality of planar extensions unitary with the cylindrical portion and extending from one of its circular edges toward the center, said ferrule being adapted to be pushed on the end of a tubular piece so that said extensions engage the circular edge of the tubular piece and adapted to have a mouthpiece inserted into the tubular piece, thereby to bring said extensions into engagement with the inside of the tubular piece.

2,102,018



CONTROL SYSTEM FOR SUBMERSIBLE MOTORS AND THE LIKE

Earl Mendenhall, Los Angeles, and Junius B. Van Horn, Alhambra, Calif., assignors, by mesne assignments, to Byron Jackson Co., Huntington Park, Calif., a corporation of Delaware

Application August 28, 1934, Serial No. 741,796

9 Claims. (Cl. 172—36)

1. In combination: a shell containing a dielectric liquid and having access to a conducting liquid tending to contaminate said dielectric liquid; circuit means extending from said shell; relay means in said dielectric liquid responsive to the amount of said conducting liquid associated therewith and electrically connected to said circuit means to change the current flowing through said circuit means in response to the amount of said conducting liquid contaminating said dielectric liquid, said relay means including means having an affinity for said conducting liquid; means for heating said relay means for driving from said means having an affinity for said conducting liquid at least a part of the conducting liquid associated therewith; and means exterior of said shell

and operatively connected to said circuit means to be responsive to current flowing through said circuit means.

2,102,019

CARBURIZING BOX

Angus M. Miller, Pleasant Ridge, Mich.

Application September 11, 1936, Serial No. 100,330

7 Claims. (Cl. 263—49)

1. In a carburizing box, a pair of one-piece relatively telescoped spaced sheet metal wall elements each bent to substantially closed rectangular form, said box comprising said sheet metal elements and corner elements, said corner elements loosely embracing the top and bottom edge portions of suitably bended corner portions of said wall elements.

2,102,020

MANUFACTURE OF WARP BEAMS

Frank Mossberg, Attlebore, Mass., assignor to Mossberg Pressed Steel Corporation, a corporation of Massachusetts

Original application August 29, 1933, Serial No. 687,291. Patent No. 2,027,749 dated January 14, 1936. Divided and this application June 13, 1934, Serial No. 730,440

8 Claims. (Cl. 29—170)

1. The method of forming a hollow, tubular warp beam, which consists in providing two sheet stock parts, forming a channel recess in one part extending longitudinally thereof adapted to receive a warp fastening rod and forming the other part to complete the circumference of a circle and then welding said two parts together with their edge portions in a contiguous relation.

2,102,021

PHOTOGRAPHIC HALF-TONE SCREEN MATERIAL AND PROCESS

Alexander Murray, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Application May 21, 1935, Serial No. 22,577

9 Claims. (Cl. 95—5)

6. A photographic element comprising a support, an emulsion layer on said support, a developed and fixed half-tone screen image of a uniform light source in one stratum of the emulsion layer, and a developed and fixed continuous tone image of a subject in a separate stratum of the emulsion layer.

2,102,022

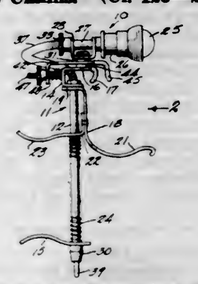
COLOR CORRECTED PHOTOMECHANICAL PRINTING PLATE

Alexander Murray, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Application July 6, 1935, Serial No. 30,091

6 Claims. (Cl. 95—5.1)

5. The method of making a set of color-corrected plates for photomechanical printing, which comprises forming blue, green, and red color separation negatives of an original in silver halide emulsions, printing positives of the color separation negatives representing colors requiring correction in sensitive silver halide emulsions, and before developing, desensitizing said positives and then exposing them separately to red light under a color filter negative representing another color, then developing and fixing the corrected color separation positives, and printing a positive directly from the remaining color filter negative.



2,102,023

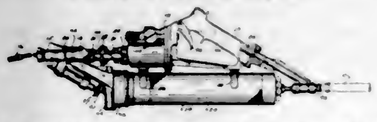
SURGICAL LAMP

Austin A. Overbury, West Orange, N. J.

Application December 10, 1934, Serial No. 756,756

6 Claims. (Cl. 128—23)

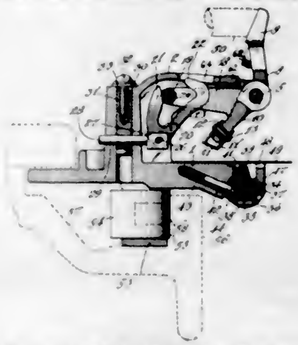
1. In a device for illumining the oral cavity of a person, a supporting frame structure including vertically disposed members having a supporting bracket at the upper end thereof, a source of light carried by said bracket, a horizontally slidable clamp member cooperating with said bracket to provide a clamping structure for engaging a portion of the interior of the oral



cavity of the person, and a vertically movable clamp member slidably mounted on said vertically disposed members which is adapted to engage the outer lower jaw portion of the person.

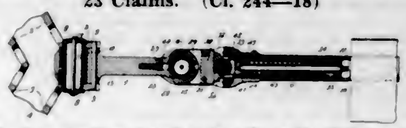
2,102,024
SAFETY FUSE
David E. Pearsall, Pittsburgh, Pa., assignor to The Ensign-Bickford Co., Simsbury, Conn., a corporation of Connecticut
Application October 16, 1936, Serial No. 105,857
8 Claims. (Cl. 102—8)

1. A fuse for igniting explosives, fireworks and the like, comprising a powder train directly encased in fused mineral matter.



2,102,025
GREASE GUN
James J. Pelouch, Cleveland, Ohio, assignor to The United States Air Compressor Company, Cleveland, Ohio, a corporation of Ohio
Application February 23, 1935, Serial No. 7,670
8 Claims. (Cl. 221—47.3)

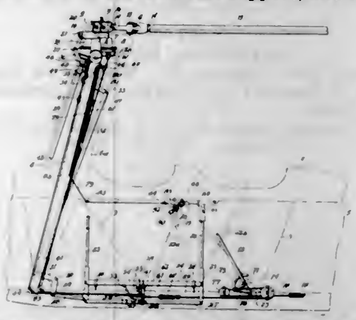
1. A grease gun, comprising in combination, a container, discharge conduit means attached thereto and leading to the ultimate point of discharge from the gun, means for conducting air under pressure to the container so as to expel lubricant therefrom at a predetermined pressure, a power-unit detachably connected to the container, an air-operated booster pump carried in its entirety in the power unit, a valve carried by the container adjacent the point of connection between the container and power unit, means for normally holding the valve closed when the power unit is disassociated from the container, and means for opening said valve automatically whenever the unit is connected to the container.



2,102,026
TENTER CLIP
John E. Peterson, Irvington, N. J.
Application August 3, 1936, Serial No. 94,024
14 Claims. (Cl. 26—62)

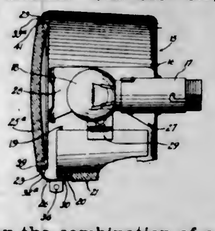
1. A tenter clip including a base having an overhanging arm, a movable member carried by said arm and extending downwardly toward said base, a jaw oscillatably carried by said movable member, said oscillatable jaw comprising a member, a transverse section of which along its length is substantially U-shaped, the arms of the U being positioned around the end of said carrying member and pivotally mounted thereto at the center of said jaw and also having slightly loose-end anchorages connecting said jaw member to said movable carrying member, a jaw tiltably carried by said base below the first-mentioned jaw and having a relatively sharp gripping edge

adapted to cooperate with the first-mentioned jaw to grip a piece of goods positioned between said jaws, said lower jaw being readily removable from the base and a controller carried by the base for controlling the time at which the cloth is gripped by said jaws, said controller having two spaced arms carried on a common pivotal mounting, said mounting being slidably adjustable directly on said base.



2,102,027
AIRCRAFT ROTOR BLADE MOUNTING MECHANISM
Richard H. Prewitt, Lansdowne, Pa., assignor to Autogiro Company of America, Willow Grove, Pa., a corporation of Delaware
Application January 30, 1936, Serial No. 61,539
23 Claims. (Cl. 244—18)

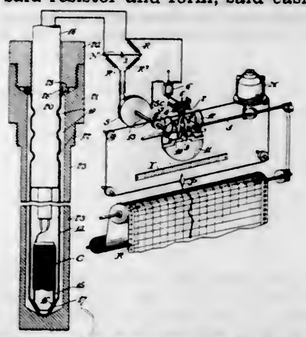
4. A mounting mechanism for attaching a rotative aircraft sustaining blade to a hub, including an articulation providing for pivotal movement of the blade to either side of a mid or intermediate position, and a self-centering means controlling blade movements, said means being substantially non-rebounding under normal flight conditions.



2,102,028
AIRCRAFT WITH SUSTAINING ROTOR
Richard H. Prewitt, Lansdowne, Pa.
Application March 11, 1936, Serial No. 68,178
9 Claims. (Cl. 244—18)

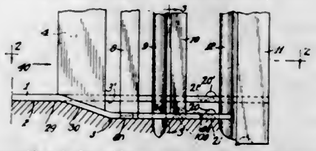
1. In an aircraft having a sustaining rotor, a pylon structure for supporting the rotor, a hub support pivotally mounted on the pylon, a non-rotative hub part pivotally mounted on said support, the axes of the two pivotal mountings being angled with respect to each other so as to provide for tilting of the hub in all directions, and mechanism for controlling tilting of the hub including a lever pivoted intermediate its ends on the pylon adjacent the mounting of the hub thereon, a short push-pull member interconnecting one end of said lever and said non-rotative hub part, a second lever pivoted intermediate its ends on the pylon adjacent the mounting of the hub thereon, a second short push-pull member interconnecting one end of the second lever and said hub support, and means

for actuating the other ends of both of said levers including for at least one of said levers a flexible cable connected therewith and extended downwardly for operation by an operator in the body of the craft, whereby a major portion of the load imposed in the push-pull member is carried in the pylon, thereby relieving the control means of a major portion of said load.



2,102,029
LAMP
Benjamin Putterman, Brooklyn, N. Y., assignor to Yankee Metal Products Corp., Norwalk, Conn., a corporation of New York
Application February 21, 1936, Serial No. 65,012
5 Claims. (Cl. 240—8.3)

3. In a lamp the combination of a casing having a main light opening and a split opening extending therefrom to enable expanding said main opening beyond its normal condition; an inturned flange on said casing defining said main opening; a lens having a pair of peripheral flanges of greater diameter than said main opening in its normal condition, providing a concave edge on said lens insertable in said main opening when expanded beyond its normal condition; and means on said casing for positively drawing said casing flange to grip said concave edge and thereby lock the casing flange between said pair of lens flanges.

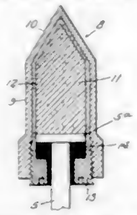


2,102,030
ELECTRICAL MEASURING SYSTEM
John F. Quereau, Barren Hill, Pa., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania
Application June 11, 1935, Serial No. 26,065
4 Claims. (Cl. 73—32)

1. A resistance thermometer comprising a metal form having small heat-storage capacity, a resistor having a substantial resistance-temperature coefficient disposed for exchange of heat by conduction with said form, and a casing enclosing said resistor and form, said casing being

joined solely at its sensitive end to said form by solder, said casing being of metal close to solder in the electromotive series.

2,102,031
METHOD AND APPARATUS FOR THE PRODUCTION OF FASTENER ELEMENTS
Bruno Reiter, London, England, assignor to Ingenium Aktiengesellschaft, Chur, Switzerland
Application June 22, 1934, Serial No. 731,878
In Germany June 23, 1933
12 Claims. (Cl. 153—1)



1. A method for the production of metal elements for sliding clasp fasteners, which consists in advancing a metal strip of a width equal substantially to the sum of the widths of several finished elements, the longitudinal edges of which are in contact with each other along their entire length, slitting the leading end of the strip to form several branch strips each of which has substantially the width of a finished element, displacing the branch strips to disengage their lateral edges from each other, preforming the elements and their limbs in each of said branch strips, spreading the limbs of the elements apart at the ends of the branch strips, and severing the elements successively from the branch strips.

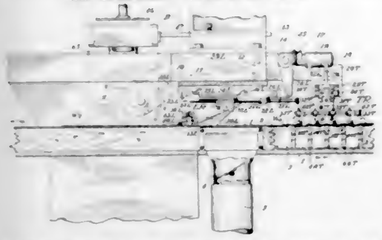
7. In an apparatus for the production of metal elements for sliding clasp fasteners, the combination of means for intermittently advancing a metal strip, means for slitting the leading end of the strip into several branch strips, means for relatively displacing the branch strips and disengaging their lateral edges from each other, means adapted to preform the elements and their limbs in each of said branch strips, spreaders adapted to open the limbs of the elements at the ends of the branch strips, and means adapted to sever the elements successively from the branch strips.

2,102,032
SOLDERING IRON
William R. Richardson, Roswell, N. Mex.
Application January 13, 1936, Serial No. 58,959
Renewed October 7, 1937
2 Claims. (Cl. 219—26)

1. An electric soldering iron comprising a rod of conductive material having an electrical connec-

tion with a source of current, a handle on one end of said rod, said rod being provided with a lateral head on the end thereof remote from said handle, a shell receiving the head equipped end of said rod, a solid carbon core arranged in the shell and

having an end bearing against said head, ground carbon arranged within said shell about said solid carbon core, and an apertured plug disposed about said rod and threaded into one end of said shell for closing the latter and for securing the shell on the head equipped end of said rod.



2,102,033

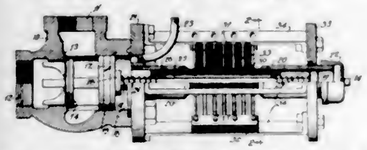
METHOD OF AND APPARATUS FOR TRANSPORTING AND REGISTERING SHEETS

Ernest G. Rider, Philadelphia, Pa., assignor to Stokes and Smith Company, Philadelphia, Pa., a corporation of Pennsylvania

Application September 11, 1936, Serial No. 100,252

33 Claims. (Cl. 271—48)

1. In a system for transporting sheets, as box wrappers, labels, or the like, the method which comprises pushing the rear edge of a sheet to effect movement of the sheet in a predetermined direction, and stiffening the sheet for movement as a whole by temporarily deforming the sheet to form one or more ridges extending substantially in line with said direction of movement.



2,102,034

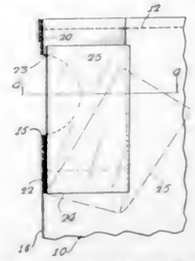
VALVE

Louis H. Roller, Plainfield, N. J.

Application April 16, 1934, Serial No. 720,695

4 Claims. (Cl. 172—240)

1. A device of the character described comprising a casing, a member reciprocable therein, a stem on said member, an armature mounted to slide on the stem, stops limiting motion of the armature relative to the stem, means adapted to maintain the armature normally in a position intermediate between the stops, stator coils surrounding the armature, means for establishing a traveling field in the stator coils to move the armature, and a reversing switch operable independently of the movement of the armature for controlling the direction of travel of said field.



2,102,035

SELF CLOSING BAG

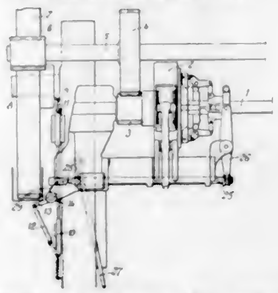
Charles Rose, Chicago, Ill., assignor to Central Bag & Burlap Co., Chicago, Ill., a corporation of Illinois

Application August 10, 1936, Serial No. 95,137

7 Claims. (Cl. 229—62.5)

1. In combination, a bag having a filling aperture, and a valve normally closing said aperture, said valve having a leaf with an aperture registering with that of said bag and a folded back leaf normally sealing said apertures, said last mentioned leaf having its end free opposite the fold.

2,102,036



CLUTCH CONTROL DEVICE

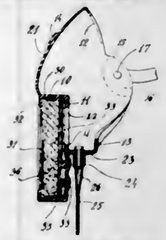
Leon Salves, Billancourt, France, assignor to Louis Renault, Billancourt, France

Application May 7, 1936, Serial No. 78,476

In France January 31, 1936

2 Claims. (Cl. 192—85)

1. A device for the automatic uncoupling of a mechanically-operated press at the upper dead centre of its crankshaft, comprising a cam mounted on said crankshaft, a clutch, a shaft controlling said clutch, a movable device actuated by said cam and including a member resiliently mounted for reciprocable movement and a link connected thereto, a coupling adapted to connect the said movable device to the said shaft controlling the clutch including a toothed arm loose on the shaft and connected to the link and a toothed jaw element slidably and non-rotatably mounted on the shaft, and actuating means adapted to act upon the sliding jaw element of the said coupling and to release the connection which it effects, and to place the said clutch in engagement at the same time.



2,102,037

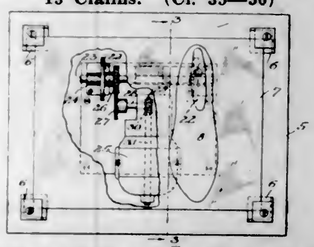
FILTER TYPE RESPIRATOR

Nathan Schwartz, New York, N. Y.

Application April 21, 1936, Serial No. 75,579

4 Claims. (Cl. 128—146)

2. In a filter type respirator adapted to enclose the nose and mouth of the wearer having a filter unit provided and the said filter unit having means provided for removably securing a filter construction consisting of foraminous metals which enclose filter material and the said metals and material are attached one to another and the said filter construction is abutting at its rear side with the rear wall of the filter unit and the said rear wall has button elevations which elevations define air grooves and part of the said rear wall is provided with an opening for connection with the face piece of the respirator.



2,102,038

METHOD OF AND APPARATUS FOR DISPLAYING SHOE LASTS AND THE LIKE

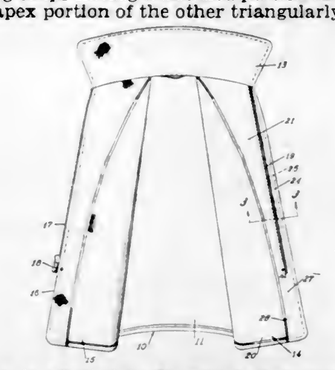
R. Plato Schwartz, Rochester, N. Y.

Application July 1, 1935, Serial No. 29,211

13 Claims. (Cl. 35—50)

1. An arrangement for displaying the behaviour of a last during movements thereof approximating movements of a human foot while taking a step, which comprises a platform, a last having at least a portion thereof resting on said platform, said last being freely movable in all directions about an upwardly extending axis, and means loosely contacting said last for raising and lowering the heel portion thereof.

2,102,039



GARMENT

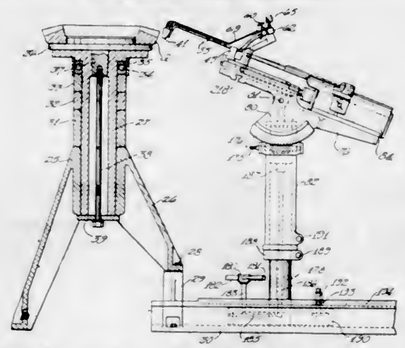
Simon Sinskey, Hammond, Ind., assignor to Winer Manufacturing Company, Hammond, Ind.

Application March 23, 1936, Serial No. 70,281

5 Claims. (Cl. 2—96)

3. A jacket having frontal flaps with complementary edge portions and fastening means for said jacket including an elongated slide fastening member attached along the edge portion of one of said flaps and a second and cooperating slide fastening member of elongated form mounted between overlying longitudinal edge portions of a pair of substantially triangularly shaped facing strips by means of stitching extended through said strips and said fastening member, one of said facing strips having a notched portion into which the apex portion of the other triangularly shaped

facing is adapted to fit, said facing strips being stitched together at the juncture of said apex portion with the other strip, said other strip having a longitudinal edge portion opposite said fastening member stitched to the inner edge portion of the other or complementary flap.



2,102,040

METHOD OF AND APPARATUS FOR HARDENING GEARS

Leon D. Slade, Rochester, N. Y., assignor to Gleason Works, Rochester, N. Y., a corporation of New York

Application August 4, 1934, Serial No. 738,570

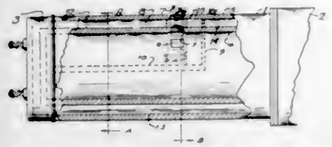
25 Claims. (Cl. 148—21)

1. The method of surface-hardening which comprises traversing a flame in one direction at a relatively high speed across the surface to be treated to pre-heat the surface, and then immediately traversing the flame across the same surface at a relatively slow speed in the opposite direction to bring the surface up to the temperature required for hardening.

4. The method of surface-hardening gears which comprises traversing a flame along a tooth in one direction from end to end to pre-heat the tooth, immediately traversing the flame along the tooth from end to end in the opposite direction to raise the tooth to the temperature required for hardening, quenching the tooth progressively immediately after it is raised to the hardening temperature, and then indexing the gear.

6. In apparatus for hardening tapered gears, a

pair of torches arranged, respectively, to direct intense flames simultaneously against opposite sides of a gear-tooth, means for traversing the torches along the tooth from end to end, and means for causing said torches to converge as they traverse the tooth from the large to the small ends thereof.



2,102,041

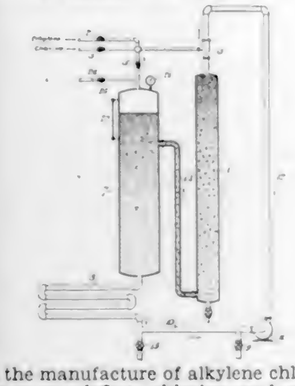
CYLINDER COOLING SYSTEM

George Allen Spelts, Los Angeles, Calif., assignor of seven percent to W. F. Arndt and thirty percent to L. J. Styskal, both of county of Los Angeles, Calif.

Application November 20, 1935, Serial No. 50,757

5 Claims. (Cl. 123—173)

3. In a cooling system of a two cycle engine having exhaust bridges provided with cores for the passage of cooling water therethrough, a cylinder, a shell around the cylinder and forming a water cooling space between the cylinder and the shell, two ribs each extending longitudinally between the shell and the cylinder from the cylinder head to a plane beyond the exhaust bridges, a semi-circular web between the shell and the cylinder and situated at the end of the ribs, a second semi-circular web provided with openings corresponding to the exhaust bridge cores and being adjacent the exhaust bridges, said webs and that part of the ribs between the planes of the webs forming an enclosed portion of the water space with the exception of the exhaust bridge cores, a water inlet provided in the shell for entrance of cooling water into the enclosed portion, and a water outlet in the shell situated still further from the cylinder head than the first mentioned web.



2,102,042

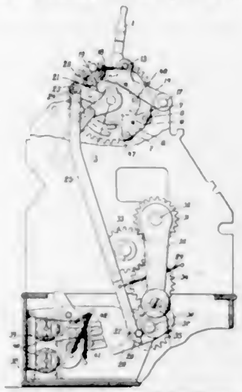
PROCESS FOR MANUFACTURE OF CHLORHYDRINES

Le Roy U. Spence, Cheltenham, Pa., assignor to Röhm & Haas Company, Philadelphia, Pa.

Application January 23, 1936, Serial No. 60,445

11 Claims. (Cl. 260—157)

1. In the manufacture of alkylene chlorhydrine from gaseous olefine, chlorine and water the steps of producing a large surface contact between liquid and gas by aspirating the chlorine and gaseous olefine into a body of water by means of a flowing stream of water, and flowing said body of water downwardly through a reaction chamber at a rate slightly in excess of that necessary to overcome the tendency of the gas bubbles to rise.



2,102,043

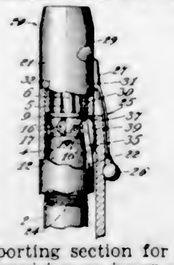
COUNTER

Percy G. Stimson, Dayton, Ohio, assignor, by mesne assignments, to Central National Bank of Cleveland, Cleveland, Ohio

Application October 25, 1934, Serial No. 749,934

15 Claims. (Cl. 235—29)

1. In a register, an amount setting mechanism, a cam disk controlled thereby having a plurality of arcuate surfaces, relatively movable cam levers carried by said disk, means whereby said cam levers are controlled, a plurality of counters, and means controlled by the positions of said arcuate surfaces and cam levers to determine which of said counters will be actuated.



2,102,044

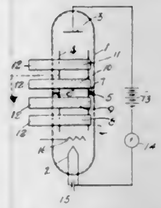
FOUNTAIN PEN AND THE LIKE

Milford Guy Sypher, Belleville, N. Y., assignor to The Chilton Pen Company, Inc., Long Island City, N. Y., a corporation of New York

Application March 31, 1934, Serial No. 718,313

11 Claims. (Cl. 120—42)

1. A pen supporting section for fountain pens and the like, comprising an inner member having threads thereon, a member telescoped and threaded over said inner member for manually gripping the pen section, and a collar member telescoped over said inner member, said collar member having notches therein adapted to lock a pen protecting cap against accidental removal from said pen section.



2,102,045

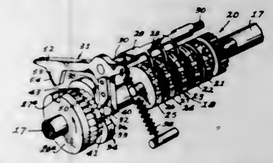
ELECTRON DISCHARGE TUBE

Albert G. Thomas, Lynchburg, Va.

Application May 13, 1936, Serial No. 79,420

3 Claims. (Cl. 250—27.5)

1. A vacuum tube comprising a cathode, an anode, a pair of opposed surfaces on either side of the normal electron path from said cathode to said anode for producing secondary electrons and means for producing a plurality of magnetic fields of alternately opposite polarity spaced between said surfaces at intervals for deflecting electrons emitted by said cathode from surface to surface along with secondary electrons to produce a relatively large number of electrons finally reaching said anode.



2,102,046

LOCKING SYSTEM FOR REGISTERING MACHINES

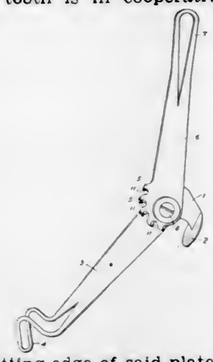
Barnwell S. Tyler, Los Angeles, Calif., assignor to National Postal Meter Company, Los Angeles, Calif., a corporation of California

Application March 4, 1935, Serial No. 9,171

8 Claims. (Cl. 235—130)

1. In a locking system for a registering machine, a register for registering each operation of the machine, a control means conditioned by the register when the amount registered therein passes a predetermined value for locking the machine against further use, and a cycling ratchet wheel and pawl means for maintaining the said control means inoperative to lock the machine until the machine has operated one or more times after the control means has been conditioned by the register.

2,102,047



CAST CUTTER

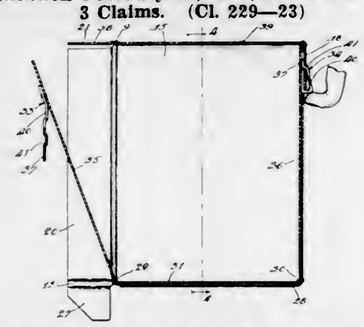
Bert Dalton Van Nader, Berkeley, Calif.

Application September 18, 1935, Serial No. 41,081

9 Claims. (Cl. 128—317)

5. A cutter for removing casts from bodies, comprising a member adapted to pass between a cast and a body, a plate rising from said member and provided with a cutting edge, an arm movably mounted on said plate, said arm having teeth thereon provided with cutting edges cooperative with the cutting edge of said plate to cut through a cast positioned above said member, said teeth being successively disposed at increased radial distances from the axis of movement of said movable arms, and at least one of said teeth being engageable with a surface of said member when said tooth is in cooperative relationship

with the cutting edge of said plate, and a handle extending from said plate.



2,102,048

COLLAPSIBLE CONTAINER

Axel M. Walstrom, Minneapolis, Minn., assignor to The Creamery Package Mfg. Company, Chicago, Ill., a corporation of Illinois

Application February 29, 1936, Serial No. 66,368

3 Claims. (Cl. 229—23)

1. A six-walled rectangular fibreboard box construction, one of the end walls of which has a hinge connection with the bottom wall and is provided adjacent its upper edge with a securing member having an upwardly extending tongue, the top wall having a flap extending downwardly therefrom between the upper portion of the end wall and the tongue, said flap having an opening through which said tongue extends, said securing member comprising two leaf portions having a hinge connection with each other, one of said leaf portions being secured to the end wall and the other leaf portion extending upwardly to form said tongue, said flap lying between said leaf portions and said hinge connection lying beneath the lower edge of said flap whereby the securing member provides a hand hold for handling the box.

2,102,049

ILLUMINATING APPARATUS AND METHOD OF MAKING SAME

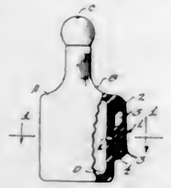
Thomas W. Warren, Montreal, Quebec, Canada, assignor to Hanbury A. Budden, Montreal, Quebec, Canada

Application March 15, 1934, Serial No. 715,666

2 Claims. (Cl. 176—122)

1. The method of producing gas containers for incandescent gas illumination comprising mold-

ing a glass member with extended channels between inclined ridges with grooves under the ridges, molding a member with a surface adapted to contact with the ridges of the first member,



fusing the contacting portions of the members by gas jets in the grooves and on the opposite surface at the same time to form an integral body.

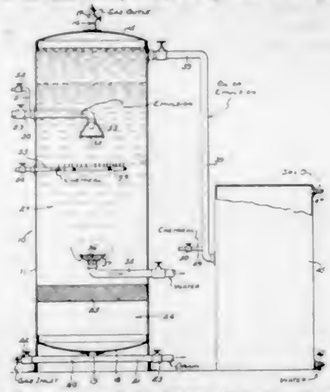
2,102,050

NIPPLE

James B. Whitbread, Detroit, Mich.

Application June 28, 1937, Serial No. 150,666
8 Claims. (Cl. 128—252)

1. A feeding nipple of flexible material, such as rubber, a wall part of which sometimes flexes inwardly due to suction through the feeding hole of the nipple, the nipple having in such flexing part a minute diameter relief port, and a closure and protective cap for the outer end of such port comprising a thick, relatively rigid block integral with and disposed outside of the nipple at said port, part of the block being separated from the flexing part of the nipple and the outer end of the port by a slit which opens to ambient atmosphere, the outer end of the port being sealed by the inner surface of the separated part of the block at the slit when the flexing part of the nipple is not flexed and being unsealed so as to be open to ambient atmosphere through the slit when the flexing part of the nipple has been flexed inwardly away from the severed part of the block, the severed part of the block remaining relatively immovable during the flexing movement of the flexing part of the nipple but being manually movable away from the outer end of the port for exposing the latter for cleaning.



2,102,051

METHOD OF SEPARATING EMULSIONS OF THE OIL-IN-WATER TYPE

William Woelflin, Long Beach, Calif., assignor to Petroleum Rectifying Company of California, Los Angeles, Calif., a corporation of California

Application June 16, 1936, Serial No. 85,521
6 Claims. (Cl. 196—4)

1. A process of treating ballast water and other oil-in-water emulsions in which the water phase is fresh water, which process includes the steps of: adding to said emulsion two materials capable of reacting to form soap which is colloidally dispersed in the water phase, one of said materials being a water-soluble salt of the alkaline earth group of metals and the other of said materials being a chemical de-emulsifying agent capable of reacting with the water-soluble salt to form said colloidal dispersion of soap; and bubbling a gas upward through said emulsion whereby the gas becomes associated with the oil droplets modified by said soap and sweeps these

oil droplets upward to leave a body of purified water.

2,102,052

FISH BAIT AND METHOD OF MAKING THE SAME

George W. Yearley, Geneva, Ohio, assignor to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application March 3, 1936, Serial No. 66,945
5 Claims. (Cl. 99—3)

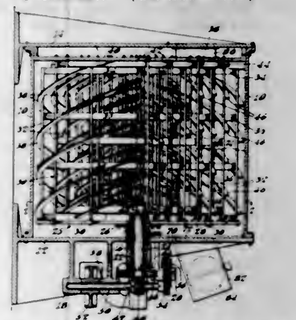
1. The method of making artificial fish bait which includes cutting a piece from a slab of pork rind and forming it to a shape suitable for artificial bait, washing it in warm water to remove impurities, impregnating it with a sodium alkyl sulphate, dehydrating it with a polyhydric alcohol maintained at a concentration in excess of 50% by weight, mechanically kneading it to render it pliable.

2,102,053

GRINDING DEVICE

George J. Batzer, Cleveland, Ohio, assignor to Micromatic Hone Corporation, a corporation of Michigan

Application September 15, 1930, Serial No. 481,893
3 Claims. (Cl. 51—184.3)



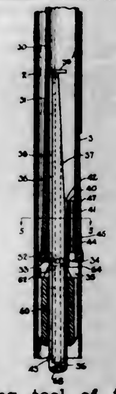
1. In an abrading tool having an abrading head, provided with an abrading element radially adjustable therein; a drive element connected to said head for universal movement with respect thereto; an adjusting member located remotely from said head; a loading spring for urging said abrading element radially of said head; a universal joint; and means forming an operative connection between said abrading element and said member through said spring and said joint.

2,102,054

APPARATUS FOR TREATING CARBON BLACK AND THE LIKE

Edmund Billings, Weston, and Harold H. Offutt, Winchester, Mass., assignors to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts

Original application November 16, 1932, Serial No. 642,850. Divided and this application September 13, 1935, Serial No. 40,438
9 Claims. (Cl. 259—105)



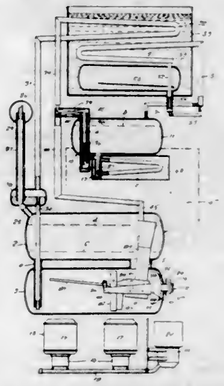
1. Apparatus for treating carbon black and the like, comprising a container providing a chamber, a plurality of parallel baffle rods distributed substantially uniformly in spaced and circular relation throughout the entire chamber, a rotary member in the chamber, a plurality of circularly arranged impelling rods carried by the member and movable therewith past the baffle rods in an approaching and receding manner and always in parallel relation as the member rotates, and spiral propelling means located substantially within the area traversed by the impelling rods for moving the impelled product in a direction substantially parallel with the axis of rotation of the member.

2,102,055

SIDETRACKING TOOL

Walter Brauer, Houston, Tex.

Application March 16, 1936, Serial No. 69,079
7 Claims. (Cl. 255—1)



1. A sidetracking tool of the character described comprising an anchor to be set in the well bore, a tapered mandrel carried by said anchor, an eccentric bushing slidable on said mandrel, and a milling cutter rotatably carried by said bushing, whereby relative sliding movement between said bushing and mandrel moves said milling cutter laterally.

2,102,056

REFRIGERATION CONTROL MEANS AND METHOD

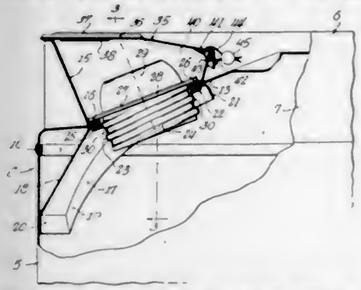
Lee S. Chadwick, Shaker Heights Village, Marc Resek, Cleveland Heights, and Wilbur G. Midnight, Bay Village, Ohio, assignors to Perfection Stove Company, Cleveland, Ohio, a corporation of Ohio

Application November 28, 1934, Serial No. 755,180
41 Claims. (Cl. 62—5)

1. In the method of refrigeration which involves intermittently heating a body of refrigerant liquor in the generator-absorber section of the system, thereby to vaporize the refrigerant, and subsequently condensing and delivering said refrigerant to the receiver-evaporator section, and during the interims between heating periods returning the refrigerant in the form of gas to the generator-absorber section; the step which consists in distributing the returning gas selectively to different parts of the body of liquor in the generator-absorber section for the purpose specified.

29. In a refrigeration apparatus including an absorber permanently containing a body of liquor, consisting of a substantially fixed amount of absorbent fluid and a variable amount of refrigerant fluid and whose different parts are of different absorbing capacities, and a gas return conduit for delivering refrigerant gas to the absorber, an instrumentality for directing the gas from said conduit selectively to different parts of the body of liquor thereby to control the speed of absorption and consequently the pressure within the system for the purpose specified.

2,102,057



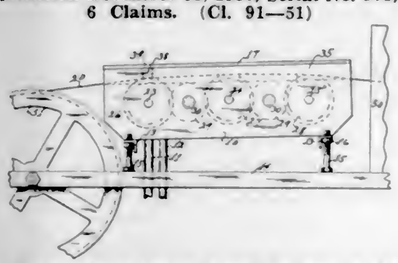
DISPENSING CONTAINER

Alfred J. Chamberlain, Wauwatosa, Wis.

Application November 14, 1935, Serial No. 49,660
13 Claims. (Cl. 221—11)

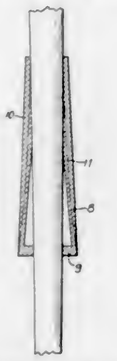
1. A dispensing container comprising a body portion having a top, said top being flat except for a depression therein, the bottom wall of the depression inclining downwardly and outwardly toward and merging with the outer surface of the periphery of the container below said top to

provide the depression with a lateral opening permitting drainage therefrom to the side of



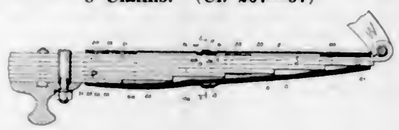
the container and being provided with an outlet opening and a spout formation on the container surrounding said opening.

2,102,058
COLLAR
Adolf Closmann, Leipzig, Germany, assignor to Atlas Ago Chemische Fabrik, Aktien-Gesellschaft, Molkau, near Leipzig, Germany, a corporation of Germany
Application April 18, 1936, Serial No. 75,045
In Germany November 25, 1935
4 Claims. (Cl. 2—136)



1. A collar comprising a neckband portion, a folding portion, a lower extension piece on each end of said neckband portion, an extension piece on each end of said folding portion, and an upwardly extending tip on each lower extension piece, all of said extension pieces being folded back on fold lines extending transversely of the collar and bonded to register with the terminal regions of said neckband and folding portions to double the strength thereof, said upwardly extending tips being covered and locked by the extension pieces on said folding portion providing a reinforcement of triple strength for the upper front corners of said collar.

2,102,059
DEVICE FOR APPLYING COATINGS TO WIRES
Wilber H. Convers, Poughkeepsie, N. Y., assignor to James K. Delano, Rye, N. Y.
Application December 31, 1930, Serial No. 505,705
6 Claims. (Cl. 91—51)

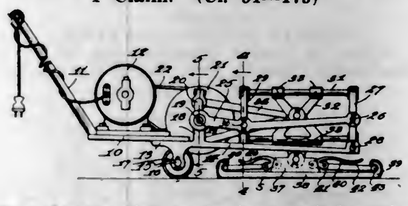


1. In a coating device, a reel for wire, a chamber for the wire through which the wire is moved longitudinally, said chamber comprising a container and means for supplying coating material thereto, a coating applying roller in said container in contact with said wire, a roller for removing excess coating from said wire having a greater peripheral speed than the speed of said wire, and means comprising a restricted inlet for causing said last-named roller to dip into said coating material to a less depth than said first-named roller.

2,102,060
GOLF SHAFT
Robert H. Cowdery and Carl Wright, Geneva, Ohio, assignors to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio
Application November 30, 1935, Serial No. 52,396
5 Claims. (Cl. 273—80)

1. A tubular metallic golf club shaft having a metallic ferrule encasing the tip portion of said shaft, a substantial longitudinal portion of said ferrule being integrally metallically joined with said shaft, and the lower portion of said ferrule being disconnected and spaced away from said shaft, said ferrule increasing in diameter beyond said area of juncture and terminating in a metallic annular shoulder, said shoulder extending inwardly and engaging the shaft at the inner periphery of said shoulder and at the area of maximum ferrule diameter, said ferrule having a cavity above said shoulder surrounding said tubular shaft, said shoulder being integral with said ferrule.

2,102,061
SPRING COVER
George W. Crabtree, Cleveland Heights, Ohio
Application February 18, 1935, Serial No. 6,966
8 Claims. (Cl. 267—37)

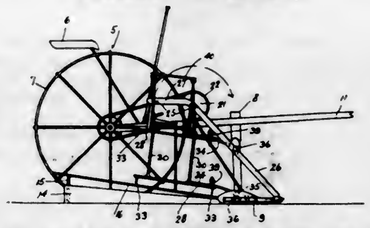


1. A cover for leaf springs comprising a plurality of box-like sections each of which embodies top and bottom substantially U-shaped channels having end portions which telescope with the end portions of the channels of an adjacent section, each telescoping portion being formed with interfitting rounded joints to permit flexing of the sections while maintaining a seal at the joint.

2,102,062
SHOULDER STRAP
Sarah M. Crewdson, Chicago, Ill.
Application May 7, 1937, Serial No. 141,310
4 Claims. (Cl. 241—12)

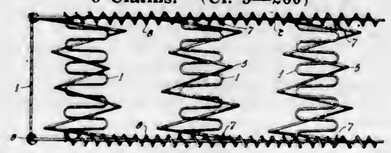
1. A garment shoulder strap structure comprising a length of cloth material sufficient to form a strap, means including a tubular strip providing a pocket and adjustably secured to said strap, said tubular strip having an opening to the pocket therein, and a stiffening member insertable endwise through said opening into said pocket for stiffening the same, whereby said strap is reinforced along the length of the tubular strip.

2,102,063
FLOOR SANDER
Fred L. Detwiler, Santa Ana, Calif.
Application November 25, 1935, Serial No. 51,418
1 Claim. (Cl. 51—175)



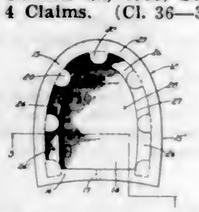
In a floor sander, a wheel supported carriage, a handle projecting from the rear end of said carriage, a pair of arms projecting forwardly from said carriage, a rail connecting the forward ends of said arms, a frame hinged to said carriage and positioned above said arms, the forward end of which frame normally rests on the rail that connects the forward ends of said arms, members mounted for reciprocatory movement in said frame, means on the carriage for imparting reciprocatory movement to said members, plates pivotally suspended from said reciprocating members and means on said plates for clamping sheets of sandpaper thereto.

2,102,064
STOCKING
Charles C. Foster, Westville, N. J., assignor to The Chesterman-Leeland Company, Philadelphia, Pa., a corporation of Pennsylvania
Application September 14, 1936, Serial No. 100,620
1 Claim. (Cl. 66—172)



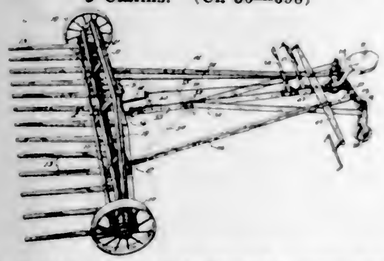
A seamless elastic stocking comprising a leg portion which is formed of strands of elastic fillers and knitted binding thread, a welt also formed of strands of elastic fillers and knitted binding thread and having therein an extra knitted binding thread, said welt having knitted therein a course having tuck-loops upon the back of the stocking at the juncture of the leg portion with the welt, and also having knitted therein a course having tuck-loops upon the back of the stocking adjacent the upper edge of the welt and spaced from the first mentioned course, whereby the welt may closely hug the leg of the wearer to retain its shape without discomfort to the wearer.

2,102,065
SEED GATHERER ATTACHMENT FOR MOWING MACHINES
James A. Gaylord, Sharon, Tenn., assignor of one-third to Lillie Gaylord, Sharon, Tenn.
Application May 9, 1936, Serial No. 78,902
Renewed September 20, 1937
2 Claims. (Cl. 56—207)



1. In combination with the cutter bar of a mowing machine, a seed pan projecting rearwardly from the cutter bar, a corrugated sieve mounted above the seed pan and provided with perforations in the grooves of the same, agitating means mounted above the said sieve for actuating the material riding on to the sieve so that seed from the material will sift through the openings therein, said agitating means consisting of an elongated crank shaft provided with a plurality of cranks therein, frame members each provided with depending teeth and having connections to corresponding cranks on the crank shaft, brushes mounted on the forward end of said frame for brushing off the said cutter bar, said brushes being provided with elongated spring arms, and supplemental spring means on the frames for urging the said brushes and arms downwardly.

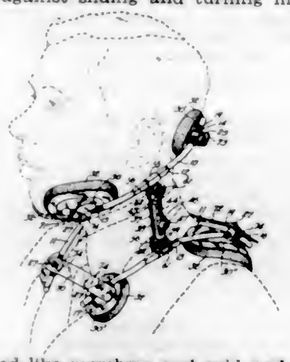
2,102,066
EDGING FOR SPRING ASSEMBLIES FOR UPHOLSTERY
William W. Gleason, Chicago, Ill., assignor to Nachman Spring-Filled Corporation, Chicago, Ill., a corporation of Illinois
Application June 29, 1936, Serial No. 87,904
3 Claims. (Cl. 5—260)



1. A spring assembly comprising a group of conventional upholstery springs tied together in predetermined relation to each other, and a peripheral spring structure bordering said spring assembly and comprising a series of wire springs lying substantially in vertical planes tangential to the terminal coils of the marginal springs of the assembly, each of said wire springs equipped with substantially horizontally disposed terminal shanks and being relatively disposed so that the shanks of contiguous springs overlap each other, and means securing the overlapped portions of said shanks to each other and to the terminal coils of the marginal springs of the assembly thereby providing resilient border wire frames peripherally of said spring assembly.

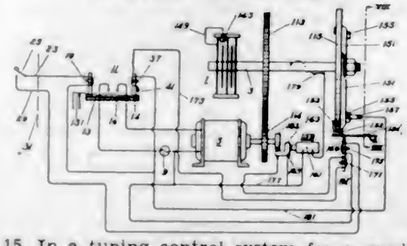
2,102,067
CUSHIONED HEEL
George W. Griffith, Norwalk, Conn.
Application October 24, 1935, Serial No. 46,464
4 Claims. (Cl. 36—35)

1. A rubber heel comprising a body having a cavity therein; a nail receiving insert; a bottom wall; a stepped wall supporting said insert, said insert and said stepped wall defining sides of said cavity; and portions of said rubber body overlying said insert to prevent the latter being pulled away from said body.



2,102,068
BULL RAKE
Arthur R. Gunnerson, Denver, Colo.
Application September 18, 1936, Serial No. 101,473
5 Claims. (Cl. 56—398)

1. A rake of the type described comprising: a pair of supporting wheels; an axle extending between said wheels; a truss enclosing said axle; rake teeth extending forwardly from said truss; hinged levers extending from said axle to said truss to maintain them in a predetermined relative relation; friction clutch members, stationary with respect to the hinged levers; a clutch member movable between the wheels and the stationary members, comprising; means for alternately connecting the axle to the wheels to be rotated thereby and for connecting it to the friction clutch members to hold it from reverse rotation, and flexible members extending between the axle and the truss, to support the latter, the flexible members being windable about the axle.



2,102,069
CERVICAL SPLINT
Paul William Hanicke, Kansas City, Mo.
Application June 17, 1936, Serial No. 85,743
22 Claims. (Cl. 128—87)

18. An apparatus of the character described, comprising a head-engaging member, a body-engaging member, said head-engaging and body-engaging members each comprising an elongated rod-like frame member having serrated portions near the ends thereof, means connecting said rod-like members between the ends thereof, and pad holders comprising sleeve portions mounted for sliding and turning adjustment on said serrated portions of said rod-like members, pad carriers swivelled on said sleeve portions, and means for simultaneously clamping said sleeve portions against sliding and turning movement

on said rod-like members and said pad carriers in fixed position on said sleeve portions.

2,102,070
REMOTE CONTROL SYSTEM
Floyd M. Harris, Merchantville, N. J.
Application July 15, 1933, Serial No. 680,527
17 Claims. (Cl. 250—40)

15. In a tuning control system for a receiver having a tuning element therein, a primary tuning means comprising a motor, means for coupling said motor to said tuning element for moving it to a tuning position, a control device, means for causing said motor to move said tuning element in response to the actuation of said control device whereby said element is moved towards a predetermined tuning position at which said receiver is tuned exactly to a preselected station, an auxiliary tuning means operating substantially independently of the inertia of moving parts in said system for tuning said receiver exactly to said preselected station after said primary tuning means has moved said element to the region of said predetermined tuning position, and means for rendering said primary tuning means ineffective to move said element and for rendering said auxiliary tuning means effective automatically to tune said receiver exactly to said preselected stations in response to said tuning element being moved to the region of said predetermined position and regardless of whether said primary tuning means stops moving said element before or after said element has reached said predetermined position.

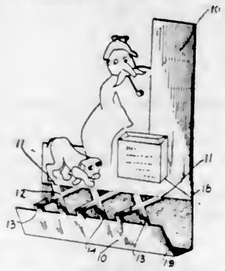
2,102,071
GEAR BROACHING MACHINE AND METHOD
William A. Hart, Detroit, Mich., assignor to Colonial Broach Company, a corporation of Michigan
Application April 29, 1935, Serial No. 18,840
11 Claims. (Cl. 90—8)

9. A device for broaching articles including a broach having a series of teeth, means for successively feeding articles to said broach so that a plurality of said articles are simultaneously in broaching position, means for effecting successive steps of relative movement between said plurality

of said articles and said broach, each step being shorter in length than the length of said broach, and said feed means being adapted to have an article fed to said broach after each said step.

2,102,072
ROTARY TOOL JOINT
Frank J. Hinderliter, Tulsa, Okla.
Application July 15, 1935, Serial No. 31,328
8 Claims. (Cl. 285—146)

1. A rotary tool joint including a box member having a threaded socket, a pin member having a threaded shank adapted to be screwed into said socket, and a sealing ring of resilient material disposed between the inner end of said shank and the bottom of said socket, said ring having its inner periphery provided with diverging annular lips which terminate in relatively sharp edges adapted to be pressed away from each other by fluid flowing through said joint into sealing engagement with the end of the shank and an edge portion of the bottom of said socket, said bottom of the socket having an integral upwardly projecting annular rib, the inner surface of which is aligned with the inner surface of the bore of the pin member, said resilient ring being disposed between said rib and a side wall of the socket on the bottom of the socket and projecting outside said rib, whereby said rib aids to confine the rubber against displacement from the bottom of the socket without interfering with the pressing of the sealing ring into tight sealing position by the inserting thrust of the shank as it is screwed into the socket.



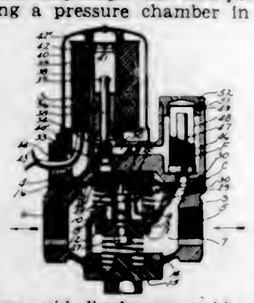
2,102,073
TREATMENT OF HYDROCARBONS
Vladimir Ipatieff and Raymond E. Schaad, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application April 19, 1935, Serial No. 17,255
8 Claims. (Cl. 196—10)

4. A process for producing liquid hydrocarbons from a hydrocarbon mixture containing butenes and propylene which comprises contacting the mixture with solid phosphoric acid catalyst at polymerizing temperature, the phosphoric acid concentration of the catalyst and the temperature being controlled and correlated to selectively polymerize butenes from the mixture, and then contacting the remaining portion of the mixture with additional solid phosphoric acid catalyst under conditions of temperature and phosphoric acid concentration which are controlled and correlated for optimum polymerization of propylene.

2,102,074
TREATMENT OF HYDROCARBONS
Vladimir Ipatieff and Raymond E. Schaad, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application February 24, 1936, Serial No. 65,413
8 Claims. (Cl. 196—10)

8. A process for producing liquid hydrocarbons from normally gaseous olefin mixtures which comprises subjecting the mixture successively to the action of orthophosphoric acid and pyrophosphoric acid under polymerizing conditions.

2,102,075
ADVERTISING SIGN
Joseph Jackson, New York, N. Y., assignor to Rode & Brand, New York, N. Y., a corporation of New York
Application March 8, 1937, Serial No. 129,560
5 Claims. (Cl. 40—126)



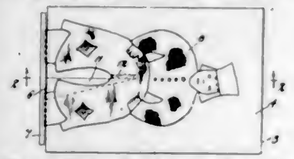
1. An advertising sign comprising a front panel and a rear panel said front panel having advertising letters stamped out thereon in an area defined by scored lines, said rear panel being secured to said front panel and being visible through said lettered area when the sign is in use and a support to retain the sign in the operative position.

2,102,076
VALVE CONTROL
Roy W. Johnson, Milwaukee, Wis.
Application May 31, 1935, Serial No. 24,177
7 Claims. (Cl. 137—139)

2. A control valve of the character described comprising a bottom casing member having an inlet and an outlet and provided with a ported partition between said inlet and outlet, a main valve cooperable with said ported partition to regulate flow therethrough, there being means biasing said main valve to closed position, an upper casing member connected to said lower casing member, a diaphragm disposed between said casing members and having a port therethrough and provided with a valve seat surrounding said port, a stem carried by the main

valve and having a tapered end cooperable with the valve seat of said last-named port, a spring between said diaphragm and said ported portion, there being a pressure chamber in said upper

casing above said diaphragm, said casing members having a bypass therein leading from said inlet to said pressure chamber and a solenoid valve in said bypass controlling flow from said inlet to said pressure chamber.



2,102,077

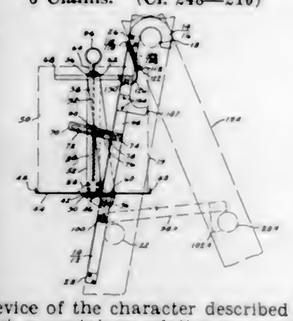
NOVELTY BOX

Milton Kahn, New York, N. Y., assignor to Novelart Mfg. Co., New York, N. Y., a firm

Application October 28, 1935, Serial No. 47,177

4 Claims. (Cl. 229—8)

1. A polygonal novelty box having the combination of a merchandise container, a telescopic cover for said container, a cut-out figure, a board hinged to the bottom of said figure, said board being secured to the side of said cover, and said figure depending from said hinging normally lying upon the top of said cover.



2,102,078

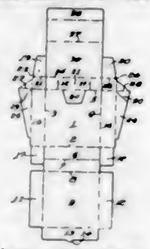
SUPPORT DEVICE

George W. Kemp, Dayton, Ohio

Application February 9, 1935, Serial No. 5,759

6 Claims. (Cl. 248—210)

6. A device of the character described adapted to support a container relative to a supporting structure comprising, in combination, a multipart bracket, one part of which is adapted to engage a supporting structure and another part of which is adapted to receive a container, the container receiving part including resiliently urged hook means adapted to grip the container and hold it in place; and means pivotally connecting said parts together, the construction and arrangement being such as to provide for adjustment of the container receiving part in directions parallel to and in a plane transverse to the support engaging part.



2,102,079

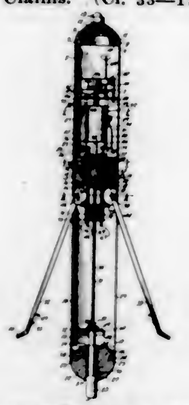
DISPLAY BOX

Albert E. Keppler, Philadelphia, Pa., assignor to Brown & Bailey Company, Philadelphia, Pa., a corporation of Pennsylvania

Application August 30, 1935, Serial No. 38,504

9 Claims. (Cl. 206—44)

1. A display box comprising a bottom, front, rear and side walls and a tray adapted to nest within the box and hinged to one of said walls for movement from horizontal to inclined position, and means carried by the walls proximate to said wall and extending through the wall opposite thereto adapted to support the tray in moved position after it has been raised thereto.



2,102,080

WELL SURVEYING DEVICE

Myron Macy Kinley, Tulsa, Okla.

Application December 23, 1935, Serial No. 55,854

8 Claims. (Cl. 33—174)

1. In a surveying device for recording surface irregularities of a bore hole, a casing, a plurality of feelers normally yieldingly retained in the casing, independent means for pivotally mounting said feelers for independent movement in the casing in radial planes extending through the axis of the bore hole, means normally retaining the feelers in latched engagement within the casing, means for releasing said feelers for engagement with surface irregularities of the bore hole, and mechanism connected with said feelers for recording variations in movements of the feelers over said surface irregularities.

2,102,081

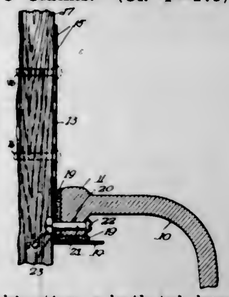
PROCESS FOR THE REDUCTION OF SULPHUR DIOXIDE TO ELEMENTAL SULPHUR BY MEANS OF CARBON

Robert Lepsoe, Trail, British Columbia, Canada, assignor to The Consolidated Mining & Smelting Company of Canada, Limited, Montreal, Quebec, Canada, a company of Canada

Application January 14, 1936, Serial No. 59,095

9 Claims. (Cl. 23—226)

1. A process for the reduction of sulphur dioxide to elemental sulphur by means of carbon which comprises introducing sulphur dioxide, at a temperature sufficiently high to establish the reducing reactions, into a reducing fuel bed consisting essentially of carbonaceous material and controlling the temperature of the reducing reactions by admitting at higher levels of the fuel bed additional sulphur dioxide at a temperature below the prevailing temperature of the reacting gases at the point of admission.



2,102,082

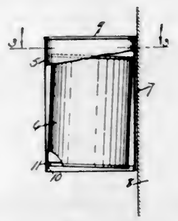
BATHTUB HANGER

William B. Lucke, Wilmette, Ill.

Application March 30, 1936, Serial No. 71,612

3 Claims. (Cl. 4—173)

1. In combination, a bath tub hanger embodying a bracket member having a substantially vertical portion spaced from and extending across the outer face of the rim of a tub and projecting above and below the top and bottom of said rim, said bracket also having a laterally projecting portion extending beneath the lower edge of said rim, sealing material disposed between the outer face and lower edge of said rim and the portions of said bracket that are respectively adjacent said face and edge, and means permanently securing the bracket to the tub rim, adapting the tub and bracket for shipment as a unit, in assembled relation.



2,102,083

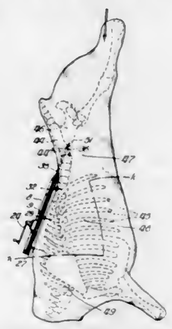
RECEPTACLE HOLDER

Isaac Murray MacDonald, West Hartford, Conn.

Application August 4, 1936, Serial No. 94,181

3 Claims. (Cl. 312—112)

1. A receptacle holder comprising a case having an open lower end, and a retaining finger projecting inwardly and upwardly at the lower open end of the case at a distance from the wall of said case to provide a space to receive a receptacle inserted through said lower open end and shifted laterally to engage said finger.



2,102,084

METHOD OF AND APPARATUS FOR TREATING BEEF CARCASSES

Grant H. Miller, Caldwell, N. J.

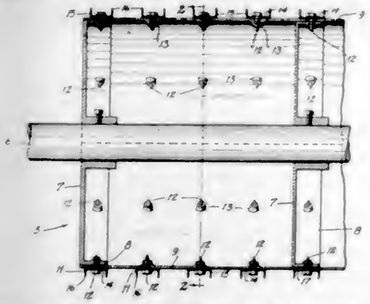
Application August 11, 1934, Serial No. 739,429

21 Claims. (Cl. 17—44)

9. A device for treating an animal carcass comprising attachment means for attachment to the carcass, a plurality of engaging means for engaging the meat in desired parts of the carcass, and means connected between said attachment means and said engaging means for causing said engaging means to move different distances relatively to said attachment means.

2,102,085

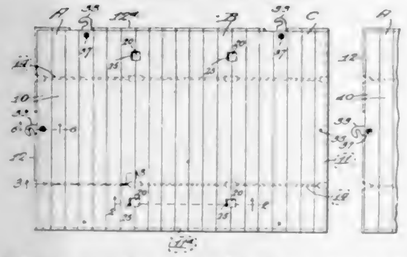
COTTON EXTRACTING SAW CYLINDER



Orville Mitchell, Dallas, Tex.

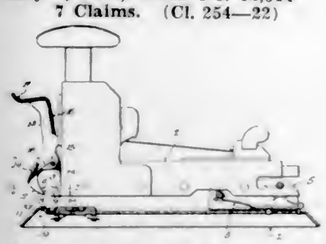
Application February 10, 1936, Serial No. 63,169

3 Claims. (Cl. 19—63)



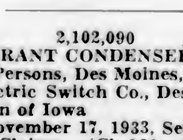
1. A saw cylinder for cotton extracting machines comprising a shaft, a series of disks secured at intervals thereon, each of which is provided with a continuous peripheral flange extending at right angles to the body of the disk, a sheet metal housing surrounding said disks and supported on said flanges, a series of channel-shaped saw bands encircling said housing at intervals throughout its length each of said saw

bands being provided in its base with separated elongated openings, and self-threading screws



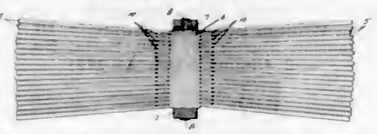
passed through said openings and driven into apertures in said housing.

2,102,086
PORTABLE DANCE FLOOR
Herbert B. Mueller, Los Angeles, Calif.
Application December 24, 1936, Serial No. 117,638
12 Claims. (Cl. 20—6)



1. In a portable dance floor or mat, a panel composed of three sections of equal size and shape, double-acting hinges connecting the end sections with the intermediate section so that said end sections may be folded onto the top or bottom of said intermediate section, and means mounted in the panel adjacent the edges thereof for securing a number of the panels to each other in assembled relation.

2,102,087
TOOL FOR REMOVING STAPLES
William G. Pankonin, Chicago, Ill.
Original application December 12, 1932, Serial No. 646,846. Divided and this application February 6, 1936, Serial No. 62,614
7 Claims. (Cl. 254—22)

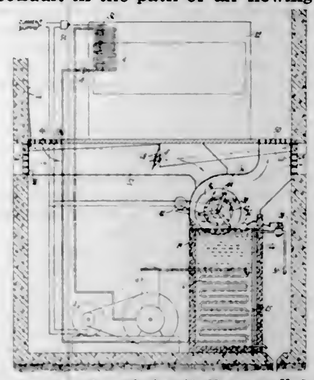


1. In a device of the type described, a base, an arm movable relative to said base, there being a jaw on said arm, said base, arm and jaw being positioned so that movement of said arm toward and away from said base causes said jaw to move into and out of abutting relationship with said base, and a second jaw independently cooperable with said first mentioned jaw and carried by said arm.

2,102,088
AUTOMATIC SAFETY SEAL
Guillermo Douglas Palmer, Buenos Aires, Argentina
Application April 4, 1936, Serial No. 72,695
6 Claims. (Cl. 292—323)

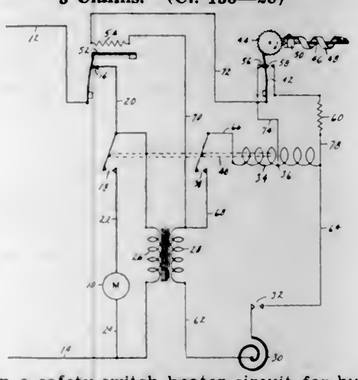
1. A locking seal comprising in combination with a member to be locked having an aperture, a closed casing having a slot in one end, a pair of spaced guides in said casing, registering apertures in each of said spaced guides, a locking member forming a sleeve around said spaced guides and slidable thereover, a pin resiliently mounted in said sleeve and bearing against the surface of one of said spaced guides when the seal is in unlocked condition, said pin being adapted to snap into said apertures when in registry therewith and means for automatically bringing said pin in registry with said apertures when the member to be locked is inserted through said slot and when the aperture of said latter member is in registry with said first mentioned apertures.

2,102,089
METHOD OF APPLYING SICCATIVE COATINGS TO BUNDLED SHINGLES
Charles N. Perrin, Buffalo, N. Y.
Application October 1, 1935, Serial No. 43,025
7 Claims. (Cl. 91—68)



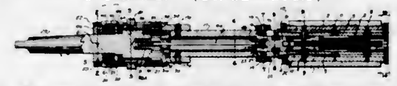
1. A method of preparing bundled shingles for treatment, comprising the elongation of the bundle by pulling the butts of the shingles at each end of the bundle away from each other a sufficient distance to permit portions of the thinner tip parts of the shingles of adjacent layers on each end of the bundle to be flexed far enough to allow separators to be forced between such adjacent layers of shingles, toward the center of the bundle, and beyond those areas of the shingles which are later exposed when they are laid in courses for use.

2,102,090
REFRIGERANT CONDENSER COOLER
Lawrence M. Persons, Des Moines, Iowa, assignor to Penn Electric Switch Co., Des Moines, Iowa, a corporation of Iowa
Application November 17, 1933, Serial No. 698,476
3 Claims. (Cl. 261—92)



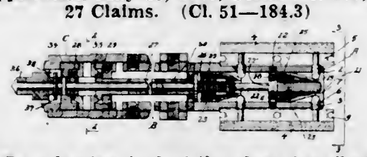
2. The combination with a receptacle, conduit means for directing air through the upper portion of said receptacle, a condenser coil having portions inclosed in said receptacle and means for supplying a cooling liquid to said receptacle

to a level above said condenser; of a device comprising a set of circular disks rotatably mounted in said conduit in the path of air flowing there-



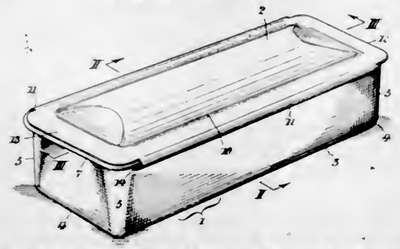
through on an axis substantially parallel to said liquid level, said axis being located a distance thereabove less than the radii of said disks and means for rotating said disks.

2,102,091
SAFETY SWITCH HEATER CIRCUIT FOR BURNER CONTROLS
Lawrence M. Persons, Des Moines, Iowa, assignor to Penn Electric Switch Co., Des Moines, Iowa, a corporation of Iowa
Application August 13, 1935, Serial No. 35,988
3 Claims. (Cl. 158—28)



1. In a safety switch heater circuit for burner controls, the combination with a circuit having a relay, a room thermostat and a safety switch heater, of a combustion responsive switch having first contacts closed in the absence of combustion and second contacts closed in the presence of combustion, said first contacts being arranged to connect said safety switch heater in series circuit with a part of said relay, an impedance element, said second contacts being arranged to connect said safety switch heater in series circuit with said impedance element, and holding contacts for and closed by energization of said relay which are in series with all of said relay and thereby, together with the remaining part of said relay, shunt said safety switch heater when said first contacts are engaged and, together with all of said relay, shunt said impedance element and said safety switch heater when said second contacts are engaged.

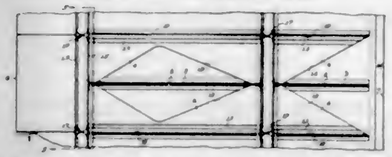
2,102,092
ABRADING TOOL
Thomas F. Quigley, Cleveland, Ohio, assignor, by mesne assignments, to Micromatic Hone Corporation, a corporation of Michigan
Application November 3, 1927, Serial No. 230,799
8 Claims. (Cl. 51—184.3)



1. In an abrading tool, the combination of a hollow mandrel, a set of abrading members adjustable radially therein, pins connected to said members and extending into the mandrel, and cones in the mandrel engaging the inner ends of the pins, the cones being fluted where they engage the pins, thereby permitting self-adjustment for equalizing the pressures on the ends of the abrading members.

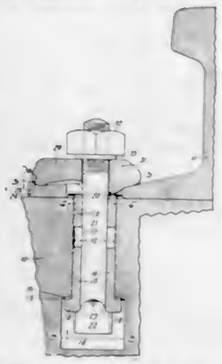
2,102,093
HONING AND LAPPING MACHINE
Thomas F. Quigley, Cleveland, Ohio, assignor to Micromatic Hone Corporation, a corporation of Michigan
Application May 18, 1928, Serial No. 278,883
27 Claims. (Cl. 51—184.3)

1. In a honing tool of the class described, the combination with a head and abrading devices carried thereby, of instrumentalities for expanding the abrading devices, said instrumentalities including expanding members which affect the abrading devices at opposite ends thereof, driving means for causing operation of the expanding instrumentalities, and driving metallic connecting elements between the driving means and the expanding members permitting of the independent operation of each of the expanding members.



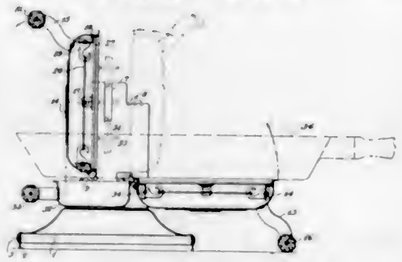
2,102,094
BOX
Morris W. Romig, Allentown, Pa., assignor to L. F. Grammes & Sons, Inc., Allentown, Pa., a corporation of Maryland
Application March 12, 1936, Serial No. 68,463
5 Claims. (Cl. 220—41)

1. As a new article of manufacture a box fashioned from sheet material and comprising a bottom component of rectangular configuration with hollow-bead flanges along its upper longitudinal edges continuous with part-round cross-section end flanges; a sliding lid component with side edge flanges embracing and engaging the



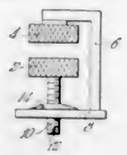
longitudinal flanges of the bottom component; shoulder and lug stops extending inwardly and upwardly from the respective interengaging flanges, said stops being located so as to limit opening movement of the lid component; and separate cooperative stops for limiting the closing movement of the lid component and determining coincidence between the contiguous perimetric edges of the two components when the box is closed.

2,102,095
AIRPLANE
Joseph R. Salzman and Carl J. Snyder, Detroit, Mich.
Application April 20, 1936, Serial No. 75,350
7 Claims. (Cl. 244—123)



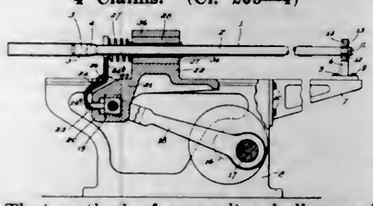
3. In an airplane, an airfoil including spaced apart spars, a skin formed of a plurality of sheet metal strips extending transversely of said spars with inwardly extended edge portions secured together to form seams uniting said strips and forming inwardly extending skin ribs, uniting strips secured to the exterior of said skin over said seams throughout the length of each seam, and L-shaped members each formed from a single sheet of metal and each secured at its ends to said spars and to said skin ribs adjacent one edge, with the laterally extending portion of each member spaced from the inner edge of the skin rib to which said member is secured.

2,102,096
FASTENING DEVICE
Alfred W. Schmid, Springfield, Ohio
Application October 27, 1936, Serial No. 107,854
10 Claims. (Cl. 238—377)



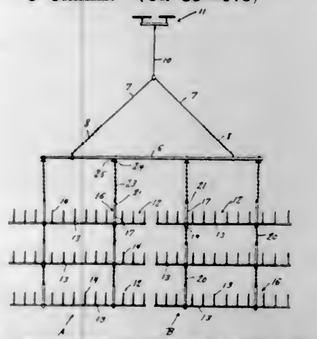
1. In a fastening device of the character described, a tubular housing adapted to be inserted in an opening in a supporting structure and having means to hold the same against upward movement with relation to said structure, a bolt removably mounted in said housing and having means to hold the same normally against upward movement with relation to said housing, a removable fulcrum member having a part to enter the outer end of said opening and retain the same in a predetermined position on said supporting structure, a clamping member mounted about said bolt and having a part pivotally supported on said fulcrum member and having another part to engage the device which is to be fastened to said supporting structure, and a nut on said bolt to move said clamping member into engagement with said device.

2,102,097
COOKING APPARATUS
Samuel D. Sherman, Cleveland, Ohio, assignor to The Forestek Plating & Manufacturing Company, a corporation of Ohio
Application July 27, 1935, Serial No. 33,524
6 Claims. (Cl. 53—5)



1. Cooking apparatus comprising a base, two brackets secured thereto, two open-sided shells pivotally supported by said brackets, heating elements within said shells, a supporting grill secured to the open side of each shell, means retaining said shells in a plurality of positions, said means comprising extensions on said shells remote from the pivotal connection, and a plurality of engaging surfaces on said brackets.

2,102,098
ADJUSTING MEANS
Royal F. Sickles, Springfield, and Herbert F. Oliver, West Springfield, Mass., assignors to F. W. Sickles Company, Springfield, Mass., a corporation of Massachusetts
Application May 19, 1936, Serial No. 80,608
7 Claims. (Cl. 151—30)

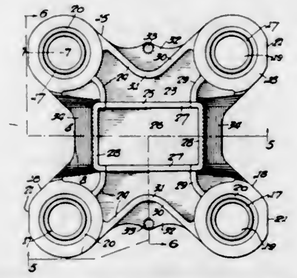


3. The combination of a support and a screw threadedly engaging the same with a lock washer for resisting rotating movements of said screw comprising, a disc-like member having an opening the periphery of which engages the groove between the thread of said screw, the said member being of spring-like thin metal provided with a slot in its periphery and being dished so that a surface thereof adjacent its periphery frictionally bears on said support and its central part is spaced therefrom, all adapted and arranged whereby said member yieldingly bears on said support to yieldingly urge said screw in one direction and resists but permits rotation thereof.

2,102,099
ENLARGING THE DIAMETER OF HOLLOW METAL ARTICLES
Fritz Singer, Nuremberg, Germany, assignor to Tubus A. G., Glarus, Switzerland
Application January 28, 1936, Serial No. 61,152
In Germany May 14, 1934
4 Claims. (Cl. 205—4)

1. That method of expanding hollow metallic articles, such as tubes, which comprises gripping and advancing a relatively short length of the article freely over a tapered mandrel head having a diameter greater than that of the article, and repeating such advancement step-by-step to expand continuously successive relatively short lengths, and thereby freely expanding the diameter of the article with relatively low change in wall thickness, the said gripping taking place a relatively short distance from the mandrel head.

2,102,100
PORTABLE WEED BURNING ERADICATOR
George Skarphol, Souris, N. Dak.
Application March 27, 1937, Serial No. 133,453
3 Claims. (Cl. 56—375)



1. In a structure of the class described, an evener bar, draft means connected thereto, multiple rake sections connected to and following the evener bar, each section including spaced parallel bars, forwardly extending teeth connected with each bar and runners connected with each bar and having portions extending under the bar to raise the teeth off the ground, said runners extending beyond the teeth together with chain means connecting the respective runners together to allow the desired independent compensating or self-leveling action.

2,102,101
PROCESS OF PREPARING FAT AND OIL SPLITTING ENZYME FROM PLANT SEEDS
Etsuo Takamiya, Moji, Japan
No Drawing. Application June 27, 1935, Serial No. 28,773. In Japan July 21, 1934
4 Claims. (Cl. 195—66)

1. The process of preparing fat and oil splitting enzyme material which comprises, adjusting the oil content of seed material which contain said enzyme to a minimum of 5% of their weight, and subjecting the said oil adjusted material to the action of from 40 to 5% of their weight of a 0.6 to 1.2 normal solution of an acid, and separating the said enzyme material from the resulting mixture of oil and acid.

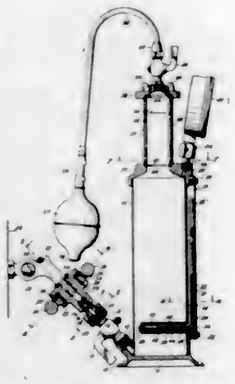
2,102,102
RAILWAY TRUCK
Donald L. Townsend, Rochester, N. Y., assignor to The Symington-Gould Corporation, a corporation of Maryland
Application January 2, 1934, Serial No. 704,958
26 Claims. (Cl. 267—3)

1. A spring nest adapted for insertion in the bolster opening of a railway vehicle side frame for the support of an associated bolster comprising upper and lower plates formed to center both helical springs and leaf springs held together by band means, said plates for that purpose having relatively thick corner portions adapted to center said helical springs, and thinner web portions connecting said corner portions and provided with ribbing, said ribbing comprising rectangular generally central portions formed to center the bands of said leaf springs.

2,102,103
PROCESS FOR RECOVERING ACIDS
Oliver M. Urbain and William R. Stemen, Columbus, Ohio, assignors to Charles H. Lewis, Harpster, Ohio
No Drawing. Application February 16, 1935, Serial No. 6,919
10 Claims. (Cl. 260—122)

1. A process for recovering acids from aqueous solution comprising effecting exchange of the anions of the acids with the anions of a solid onium compound, said onium compound having a solubility of less than 0.01 gram in 100 cc. of water at 20° C.

2,102,104
MANUFACTURE OF ISATIN DERIVATIVES
Max Wyler, Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application April 8, 1935, Serial No. 15,312. In Great Britain April 12, 1934
2 Claims. (Cl. 260—47)



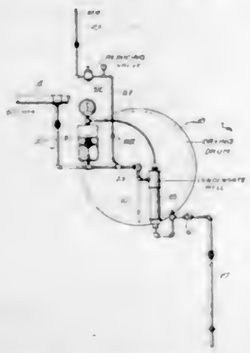
2. N-ethyl-isatin-sulfonyl chloride, being when dry a greenish-yellow crystalline compound having a melting point of 137–139° C. and being identical with the product obtainable by reacting N-ethyl-cyano-formanilide with chlorosulfonic acid at about ordinary room temperature until reaction is substantially complete.

2,102,105

METHOD OF DETERMINING THE GAS CONTENT OF SOLUTIONS

Edward Zahm, Buffalo, N. Y., assignor to Zahm & Nagel Co., Inc., Buffalo, N. Y., a corporation of New York

Application December 17, 1934, Serial No. 757,915
2 Claims. (Cl. 73—151)



1. The method of determining the gas content of a liquid beverage containing gas in solution, consisting of definitely reducing the liquid volume of said solution without the admission of air, and then ascertaining the pressure and temperature of said solution and from this data empirically determining the gas content of said solution.

2,102,106

APPARATUS FOR DISCHARGING CONDENSATE FROM DRYING DRUMS

William S. Allen, Warwick, R. I.

Application October 21, 1936, Serial No. 106,813
2 Claims. (Cl. 34—4)

1. Apparatus for disposing of condensate in drying drums comprising the combination with the drum, of a steam supply pipe, a thermostatically controlled valve in said pipe, a pipe for delivering air under pressure to said drum, a condensate discharge pipe, and a reducing valve in said air pipe for maintaining a constant predetermined pressure in said drum sufficient to discharge the condensate therein through said discharge pipe.

2,102,107

PRODUCTION OF AMMONIUM SULPHATE

Gerrit Berkhoff, Jr., Kerensheide, Post Lutterade, Netherlands, assignor to De Directie van de Staatsmijnen in Limburg, Heerlen, Netherlands

No Drawing. Application March 3, 1934, Serial No. 713,882. In the Netherlands October 16, 1933

10 Claims. (Cl. 23—119)

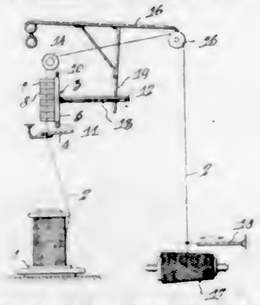
1. In the preparation, by the saturation process, of ammonium sulphate in relatively coarse crystalline form from solutions prepared with commercial sulphuric acid containing the usual small amounts of metallic impurities, the process which comprises adding to such a solution, while maintaining the concentration of sulphuric acid therein below 1.5 per cent, a soluble phosphatic compound in amount not substantially more than sufficient to precipitate said impurities from solution thereby producing a liquor having a reduced content of said metallic impurities in dissolved form, crystallizing ammonium sulphate from said liquor and recovering the coarse crystals thereby produced.

2,102,108

COMBUSTIBLE LIQUID LIGHTER

Léon Bolle, Geneva, Switzerland, assignor to La Nationale Societe Anonyme, Geneva, Switzerland

Application July 22, 1936, Serial No. 92,007
In Switzerland July 27, 1935
9 Claims. (Cl. 67—7.1)



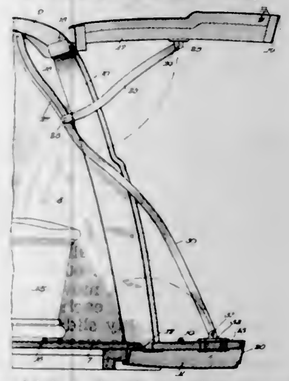
9. A lighter comprising an abrading wheel, a shaft upon which said wheel rotates, a support pivoted on said shaft, a piece of pyrophoric material slidably mounted in said support adapted to cooperate with said wheel, resilient means urging said material towards said wheel and locking said support from pivoting and means for retracting said resilient means and thereby permitting pivoting of said support whereby said material may be replaced.

2,102,109

TENSION COMPENSATOR FOR WINDING MACHINES

Leo Brueggemann, Wuppertal-Oberbarmen, Germany, assignor to American Bemberg Corporation, New York, N. Y., a corporation of Delaware

Application December 26, 1935, Serial No. 56,130
In Germany December 28, 1934
4 Claims. (Cl. 242—154)



1. In a device of the class described, in combination, a thread brake comprising opposed grill members, each of said members having a plurality of fingers through which thread passes, each of said grill members having a projection extending in a direction opposite to the said fingers, said projections forming an angular space, a guide roller mounted on a resilient member, a finger element mounted on said resilient member and projecting into the angular space formed by said projecting elements and adapted to thereby vary the braking tension as the resilient member varies in position with the varying tension of the thread.

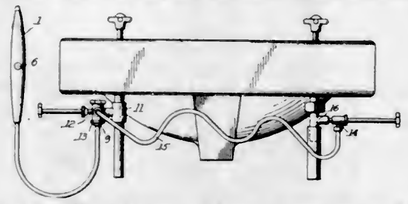
2,102,110

VEHICLE BODY

Jay Fred Burkey, Auburn, Ind., assignor to Auburn Automobile Company, Auburn, Ind., a corporation of Indiana

Application June 10, 1935, Serial No. 25,704
2 Claims. (Cl. 296—106)

1. In a vehicle body, the combination of a body comprising a floor and provided with an opening for loading and unloading purposes, a closure for said opening comprising a lower door pivoted at its lower end to the body to swing vertically from its closed position outwardly of the body and into substantially horizontal alignment with the floor and an upper door pivoted at its upper end to the body to swing vertically and outwardly from the body, and an operative connection between the doors comprising a pair of links respectively pivoted to the doors, a pivotal connection between the links which permits them to swing on a common axis, and a fixed guide for slidably controlling and for arresting the pivotal connection so that the links will conjointly shift the doors and for arresting the pivotal connection at a point where the links will be automatically supported through the pivotal connection and the guide to secure and support the doors in their open and substantially horizontal position the link for the upper door being positioned, when the upper door is open, obliquely and acting as an oblique strut between the fixed guide and the upper door, the lower link being oblique, and acting as a suspension member between the guide and the lower door, when the lower door is open.



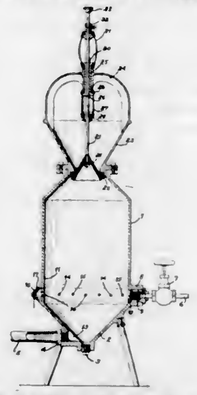
2,102,111

SYRINGE FOR COLD-HOT WATER SUPPLY

Henry Cleveland, Munksnas, Helsingfors, Finland

Application September 20, 1935, Serial No. 41,487
In Finland August 27, 1934
1 Claim. (Cl. 128—229)

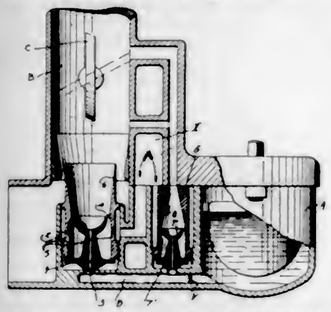
In a syringe construction for cold and hot water supply systems, two T-coupling devices adapted to be permanently connected, the one with the cold water supply line, the other with the hot water supply line, a water supply regulator connected with each of said T-coupling devices, a mixing chamber adjacent to and connected with one of said water supply regulators, an extendible flexible piping connection between said mixing chamber and the other water supply regulator, in the connection between the water supply regulators, a back pressure valve adapted to prevent water of higher pressure from entering



the water line system of lower pressure, and a syringe detachably connected with the mixing chamber and having a pencil-like nozzle with exchangeable ends, a shutting arrangement in said nozzle operated by finger-pressure, and after said shutting arrangement in the direction of the flow of water a receptacle for an antiseptic consisting of an excavation in said nozzle and divided into two spaces, namely a dissolving-space and a mixing-space, situated at the front thereof and provided with guide blades adapted to create a whirling effect.

2,102,112

POWDER LOADING DEVICE

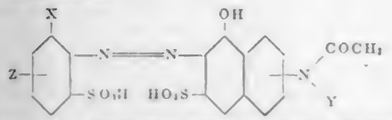


Joseph C. Costello, San Francisco, Calif.

Application September 3, 1935, Serial No. 38,993
2 Claims. (Cl. 86—21)

1. A powder loading device, having a cylindrical loading chamber, a blowing chamber disposed thereabout, a plurality of ports between said blowing and loading chambers, an intake valve surmounting said loading chamber, said valve comprising a soft, resilient, member having an inverted conical shape, a loading funnel fixed upon said loading chamber and having a soft, resilient, valve seat disposed therein so positioned as to seat said valve, a frame supported on said funnel, a sleeve supported thereon, a valve stem slidably positioned therein fixed to said valve, resilient means for positioning said stem vertically, and resilient closure members attached to said stem and said sleeve member.

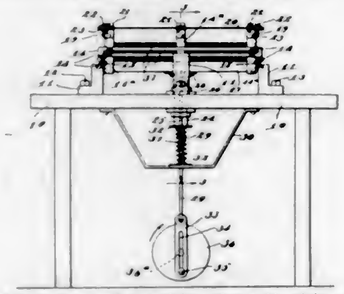
2,102,113
CARBURETOR
Yesdimir Djordjevitch, Paris, France
Application October 24, 1935, Serial No. 46,620
In France October 24, 1934
6 Claims. (Cl. 261—75)



1. In an internal combustion engine, the combination with fuel admission means including a fuel supply, a butterfly type throttle valve and a passageway arranged anteriorly to the throttle valve and showing a frusto-conical portion, of a fuel atomizer arranged in said passageway and comprising a channelled stem and a solid cup-shaped part integral with said stem into which the channel in the stem opens and the wall of which is substantially hemispherical and has a thickness which decreases progressively down to substantially zero between the stem and the outer edge of the cup shaped part, said outer edge lying moreover very near and substantially in the plane of the extremity of the frustoconical portion of the passageway and facing unobstructedly the location of the periphery of the throttle valve when closed.

2,102,114
LACQUERS OF THE UREA RESIN TYPE
Carleton Ellis, Montclair, N. J., assignor to Ellis-Foster Company, a corporation of New Jersey
No Drawing. Application June 9, 1930, Serial No. 460,110
15 Claims. (Cl. 134—26)

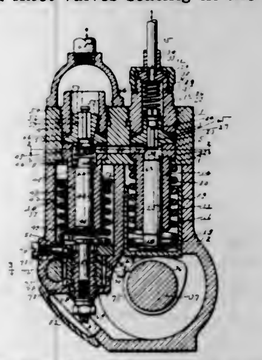
1. A soluble resin of the urea type carried in a vehicle comprising a substantial proportion of an organic solvent.



2,102,115
MONOAZODYESTUFFS
Richard Fleischhauer, Frankfort-on-the-Main-Fechenheim, and Erich Fischer, Bad Soden at the Taunus, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application July 7, 1934, Serial No. 734,202. In Germany, August 22, 1933
5 Claims. (Cl. 260—92)

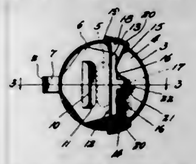
1. Monoazodyestuffs corresponding to the general formula

wherein X is selected from the group consisting of hydrogen, methyl, methoxy and phenoxy, Y is selected from the group consisting of hydrogen and alkyl and Z is selected from the group consisting of hydrogen, halogen, methyl and acetylamino, which dyestuffs dye animal fibers bright and even yellowish orange to bluish red shades of a good fastness to light.



2,102,116
COTTON SETTING MACHINE
Robert Fox, Chelsea, Mass.
Application September 26, 1936, Serial No. 102,661
3 Claims. (Cl. 93—36)

1. An improved machine for attaching cotton padding to the covers of paper boxes comprising in combination, a base member comprising a table top upon which the said paper box covers are handled, horizontal gauge slide-ways mounted on said table top, said gauge slide-ways being adjustable, the side and end slide-way members being adjustable toward each other with the end and side slide-way members moving on said table top at ninety-degrees to each other, vertical guide members horizontally slidable and adjustably mounted on said slide-ways and means for securing the end vertical members in temporary positions for the accommodation of different size box covers, a feed platform located within the confines of said vertical gauges and adapted to move up and down carrying a plurality of sheets of cotton padding, a shaft located below said platform and attached thereto and guided in said table top and a brace member located below said table top, a compression spring located on said shaft below said table top and above said brace member and normally adapted to maintain said platform in an elevated position, a slotted link pivoted to said shaft and having a pivot pin engaging in said slot and being adapted to slide up and down in said slot, a disc connecting with said pin being adapted to rotate and permit said link to rise and fall as the said compression spring elevates said platform and said pin depresses said platform, shaft and link.

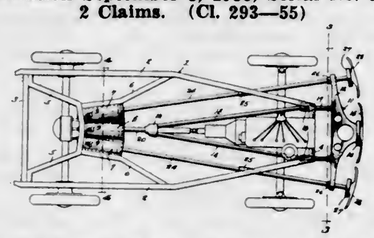


2,102,117
PUMP
Mark J. Goldberg, Muskegon Heights, Mich., assignor to Campbell, Wyant and Cannon Foundry Company, Norton Township, Mich., a corporation of Michigan
Application July 13, 1936, Serial No. 90,277
2 Claims. (Cl. 103—37)

1. A fluid fuel pump for internal combustion engines, comprising: a housing consisting of detachably connected first and second members, said first member having first and second bores and said second member having third and fourth bores coaxial with the first and second bores respectively; a first cage and a second cage removably seated in the first and second bores and extending therethrough and into the third and fourth bores respectively and having coaxial therewith fifth and sixth bores respectively; removable plugs in the first and second bores respectively; valve seat members in the first and second bores removably held between the plugs and the ends of the cages respectively and having end portions removably seated in the fifth and sixth bores respectively; normally closed discharge and inlet valves seating in the valve seat

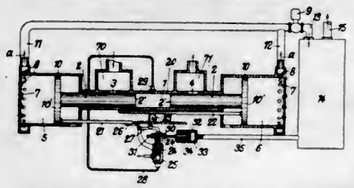
members in the first and second bores respectively; a pumping plunger reciprocatingly bearing in the fifth bore; an accumulator plunger reciprocatingly bearing in the sixth bore, said first member having a fluid fuel passage extending therethrough and connecting the fifth and sixth bores; and means for reciprocating the pumping plunger.

2,102,118
COMBINED CLOSURE AND POWDER EJECTOR
William C. Heatlie, Norwood, Mass.
Application February 4, 1937, Serial No. 124,091
10 Claims. (Cl. 221—62)



1. A head for a dispensing container having an end wall formed with a discharge opening, a closure plate for said discharge opening disposed against the inner face of the end wall and formed with an opening to register with the discharge opening of said wall, a feeder extending from said plate along its opening at the opposite side edge thereof from the opening in the wall, means for shifting said plate into position to dispose its opening in registry with the opening of the wall and move the feeder towards the opening in the wall for conveying contents of the container into position to pass through the registering opening of the wall and plate, and means for yieldably holding said plate in closing relation to the opening of the wall having a portion constituting a barrier cooperating with the feeder for directing material through the registering openings.

2,102,119
PROCESS OF PRODUCING A SLAG SOIL CONDITIONER
Lewis C. Henkel, Fairfield, Ala.
No Drawing. Application January 8, 1935, Serial No. 925
1 Claim. (Cl. 75—54)



In the method of forming a phosphate containing slag adapted for use as a fertilizer which comprises dephosphorizing by means of a strongly basic oxidizing slag in a basic open hearth furnace a molten metal steel bath containing a sufficient amount of phosphorus to be capable of introducing sufficient phosphorus in the slag to make the same adapted for use as a fertilizer, the step of thinning the slag during the refining process in the furnace by additions of bauxite to the molten slag to render the phosphate compounds in the slag citrate soluble.

2,102,120
AUTOMOBILE BUMPER
Charles D. Hevenor, Buffalo, N. Y.
Application September 3, 1936, Serial No. 99,278
2 Claims. (Cl. 293—55)

2. In a device of the class described, a vehicle chassis comprising side rails, a bumper structure extended ahead of the chassis, and cushioning means yieldably resisting the rearward movement of the bumper structure, the cushioning means being located in and symmetrically with respect to the median longitudinal axis of the chassis, within the chassis and in widely-spaced relation to the side rails, and close to the rear end of the chassis, thereby to transform the thrust imposed upon the bumper structure, into a pull throughout the major forward portion of the chassis, the pull being exerted in the median longitudinal axis, and closely adjacent thereto, and far enough inwardly from the side rails, so that the forward end of the chassis will have a minimum tendency to swing laterally when the bumper structure receives impact.

2,102,121
FREE PISTON ENGINE
Hermann Jänicke, Dessau, Germany, assignor to Hugo Junkers, Dessau, Germany; Therese Junkers, née Bennhold, Gauting, Germany, administratrix of said Hugo Junkers, deceased
Application February 9, 1934, Serial No. 710,483
In Germany February 16, 1933
14 Claims. (Cl. 230—56)

7. A free piston motor compressor comprising a motor cylinder and a free motor piston arranged in this cylinder, a compressor chamber adjoining one end of said cylinder, a compressor piston arranged in this compressor chamber for reciprocation therein and fixed to said motor piston, a cavity communicating with said compressor chamber and adapted to be supplied with compressed air from said compressor chamber,

means for controlling the amount of fuel supplied to said cylinder in dependency on the pressure in said cavity, and automatic means for controlling the suction pressure in said compressor chamber in dependency from the pressure in said cavity.

2,102,122

FOUNDRY CORE AND DRY BINDER FOR THE PREPARATION THEREOF

Fred H. Lane, Hillsdale, N. Y., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 12, 1936, Serial No. 95,706
5 Claims. (Cl. 22—188)

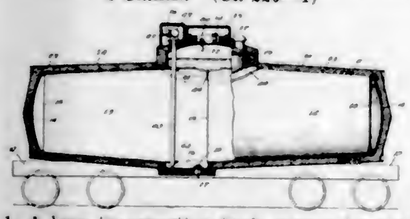
1. As a core binder, a mixture of soybean meal containing a vegetable oil, and a gasoline-insoluble, pine wood resin produced by extracting resinous wood with a coal tar hydrocarbon, removing said hydrocarbon by evaporation, extracting the residue with a petroleum hydrocarbon, and recovering a gasoline-insoluble resin.

2,102,123

WINDSHIELD

Walter Leveau, Newport News, Va., assignor to Horace E. Dodge Boat & Plane Corporation, New York, N. Y., a corporation of Delaware

Application December 24, 1930, Serial No. 504,458
6 Claims. (Cl. 9—1)



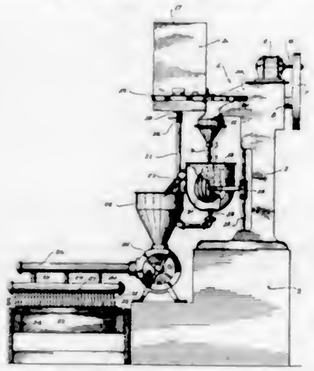
1. A wind-shield of the character described including a base member, a plurality of main shield sections separately hinged to the base member, and a side shield section hinged to each main section and operable for supporting the main section while in operative position.

2,102,124

TRANSPORTATION OF LIQUIDS

James Lithgow, Chicago, Ill.

Application May 10, 1934, Serial No. 725,001
4 Claims. (Cl. 220—1)



1. A beer transporting tank, means for rigidly securing the tank on a railway truck, said tank including a lining or inner surface of a material adapted to resist the reaction of the liquid contents, a dome at approximately the center of the tank and from which the body of the tank tapers in opposite directions to the ends thereof to prevent formation of air or gas pockets in the body thereof and to drain the contents to a central point in the bottom of the tank, the walls of the tank and dome being insulated to assist in maintaining the bulk of the liquid contents at a low temperature during transportation, a baffle plate at the bottom of the dome having a comparatively small central opening therein leading into the dome to limit surging of the liquid to the contents of the dome only; together with a filling and emptying valved pipe connecting with the tank at the lowest point of the bottom thereof, whereby the tank mounted rigidly on the railway truck facilitates the shipping of beer and similar carbonated liquids to distant points.

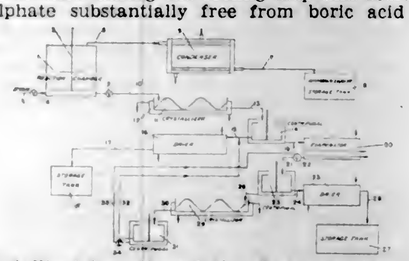
2,102,125

WHIPPING APPARATUS

Leon D. Mink, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware

Application December 6, 1935, Serial No. 53,122
4 Claims. (Cl. 259—5)

1. A device for continuously whipping liquid materials which form to a stiff consistency, comprising a whipping bowl having an inlet at the base thereof and an outlet above the inlet, a rotary whipper having a planetary movement mounted to extend within the bowl in horizontal alignment with the outlet, and means for introducing the liquid material through the inlet in an uninterrupted stream to rise in contact with the whipper, the foam resulting from the whipping operation being raised relative to the outlet by the action of the incoming fluid and forcibly passed through said outlet by the planetary movement of the whipper.



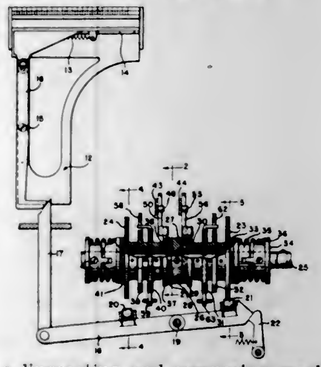
2,102,126

METHOD FOR PRODUCING AMMONIA AND BORIC ACID

John Merriam Peterson, Avondale, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application May 5, 1934, Serial No. 724,219
3 Claims. (Cl. 23—149)

1. The method of producing ammonia and boric acid which includes reacting borax and ammonium sulphate in aqueous solution, collecting evolved ammonia and separating boric acid from sodium sulphate produced by alternately cooling and heating the aqueous solution of the two salts and effecting partial evaporation of water during the cycle, whereby boric acid substantially free from sodium sulphate is crystallized from the solution during the cooling step and sodium sulphate substantially free from boric acid is



crystallized from the solution during the heating step.

2,102,127

DUPLEX RAIL SHIFT MECHANISM FOR LINE COMPOSING MACHINES

Louis M. Potts, Evanston, Ill., assignor, by mesne assignments, to Teletypesetter Corporation, a corporation of Delaware

Application August 19, 1936, Serial No. 96,735
25 Claims. (Cl. 199—29)

1. In a linecasting and composing machine, a control unit including a plurality of elements arranged to be set permutably, selectable bars controlled by said elements for performing auxiliary functions, an assembler elevator, a duplex rail therein, mechanism for operating said duplex rail comprising a member operative upon the operation of one of said selectable bars, means for holding said member in its operated position, and means responsive after a predetermined time interval following the operation of the selectable bar for utilizing the action of said member to effect the corresponding movement of said duplex rail.

2,102,128

WRAPPED ARTICLE

Harry H. Replogle, Scarsdale, and Schuyler N. Dalton, Huntington Terrace, N. Y., assignors to Sylvania Industrial Corporation, Fredericksburg, Va., a corporation of Virginia

Original application November 15, 1934, Serial No. 753,110. Patent No. 2,081,152, dated May 25, 1937. Divided and this application September 26, 1936, Serial No. 102,702
3 Claims. (Cl. 229—89)

1. A tamperproof package comprising in combination, a container in the form of a bottle, a transparent flexible wrapper of non-fibrous sheet material tightly enclosing said container, said wrapper being sealed at the bottom of said container and the upper end being draped to conform to the neck of the container, and a shrinkable container closure positioned around the top

of the container and shrunk tightly over the draped end of the wrapper and due to its shrunken condition gripping and stretching the draped end of the wrapper.

2,102,129

ELECTRIC CABLE

Samuel J. Rosch, Yonkers, N. Y., assignor to Anaconda Wire & Cable Company, New York, N. Y., a corporation of Delaware

Application November 15, 1934, Serial No. 753,107
10 Claims. (Cl. 173—266)

1. An electric conducting cable comprising a conductor, wrappings of insulating tape about said conductor, impregnating fluid in said wrappings, a sheath enclosing said wrappings and conductor, and carbon black in position adjacent said conductor and in contact with said impregnating fluid.

2,102,130

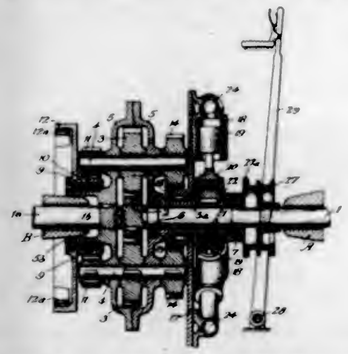
OIL-SOLUBLE PHENOLIC RESIN AND PROCESS OF MAKING SAME

John B. Rust, Orange, N. J., assignor to Ellis-Foster Company, a corporation of New Jersey

No Drawing. Application May 24, 1935, Serial No. 23,257
4 Claims. (Cl. 260—4)

1. The process of rendering an acid condensed permanently fusible phenolic-aldehyde normally oil-insoluble resin soluble in drying oil, which consists in heating said resin with successive portions of glyceride oil in the absence of other fluxing agents, the procedure being to heat the resin with the first portion of oil until a small sample withdrawn from the mixture cools to a clear bead, then adding another portion of oil to the resin and continuing the heating until a second small sample withdrawn from the mixture cools to a clear bead, and continuing this procedure until the minimum quantity of oil necessary to confer oil solubility of the resin has been incorporated in the resin, the thus oil solubilized resin being hard, brittle and light colored.

2,102,131



CHANGE SPEED MECHANISM

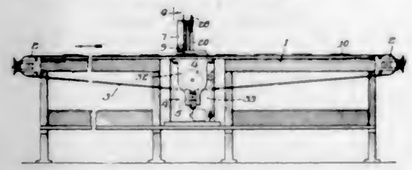
Franz Schmid, Lucerne, Switzerland

Application October 28, 1936, Serial No. 108,102
In Switzerland November 4, 1935
13 Claims. (Cl. 74—293)

1. In a change speed mechanism particularly for power vehicles, a drive shaft and a driven

shaft having a common axis, a planetary gear, a central wheel in said gear driven by said drive shaft, a box receiving said gear connected to said driven shaft, planetary wheels journaled in said box for cooperation with said driven central wheel, journal extensions on both sides of said planetary wheels, a further planetary wheel carried by each of said extensions, a brake controlled central wheel concentric with said axis for co-

operation with part of said further planetary wheels, a freely revoluble central wheel concentric with said axis for cooperation with the other part of said further planetary wheels, a pressure fluid pumping arrangement concentric with said axis for speed control of said freely revoluble central wheel, a pressure fluid circulation channel surrounding said axis and interconnecting the cylinder spaces of said arrangement, and throttle means for controlling said channel.



2,102,132

MACHINERY FOR MARKING HOSIERY OR OTHER ARTICLES

Albert H. Schmidtke, St. Joseph, Mich., assignor to St. Joseph Iron Works, St. Joseph, Mich., a corporation of Michigan

Application March 14, 1936, Serial No. 68,824

17 Claims. (Cl. 101—41)

1. A machine for transferring successive markings or impressions from a strip or sheet to hosiery or other articles to be marked, comprising means for successively feeding the articles to be marked, to the marking position, means for feeding the strip or sheet to the marking position, in timed relation to the feeding of said articles, so that the articles will be successively marked, and manually controlled devices including a screw adjustment device having interengaging screw threaded members, means to hold one member against movement and thereby in fixed stationary position on the machine, preventing this member from having any motion, and means for manually rotating the other member in the fixed member, while the machine is in operation, for governing the relative feeding action, as between the feeding of the articles and the feeding of the strip or sheet, by in effect changing the speed of one of the two feeds, to any degree within the limits of said screw adjustment, thereby to insure the desired predetermined positioning of the marking on each article, by said screw adjustment, which latter is held by said stationary member against axial movement by the feeding means.

2,102,133

FIRE TOOL

Otto Henry Schoenberger, Long Beach, Calif.

Application April 6, 1936, Serial No. 72,862

1 Claim. (Cl. 7—14.1)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

An attachment for a shovel blade, an ax bit having a cutting edge rigidly and removably attached to the extreme upper portion of said blade and extending laterally therefrom, said ax bit having a linear groove in its edge opposite the cutting edge and extending from the lower end of the ax bit to a point just short of the upper end of the bit, said groove being adapted to receive the upper portion of the shovel blade, the ax bit extending slightly above the shovel blade and the shovel blade and the ax bit having apertures in alignment with each other through their thicknesses adapted to receive a securing member.

2,102,134

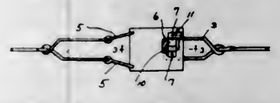
FREEZING PROCESS FOR THE SEPARATION OF THE CONSTITUENTS OF LIQUIDS

Paul Schuftan, Munich, Germany

No Drawing. Application June 20, 1936, Serial No. 86,434. In Germany July 10, 1935

5 Claims. (Cl. 62—124)

1. Process which comprises subjecting a liquid which contains at least two constituents which freeze at different temperatures to a freezing operation by applying cold through a surface of a mass of the liquid until at least one constituent thereof in that portion of said mass adjacent said surface is solidified and that portion of the mass remote from said surface is still fluid, discontinuing the application of cold to said mass and completing the freezing of said one component of the liquid throughout the mass thereof by permitting temperature equalization to occur between that portion thereof adjacent said surface and said still fluid portion remote from said surface, at least one constituent of the liquid being left fluid by said freezing operation, and mechanically separating said frozen constituent from said fluid constituent.



2,102,135

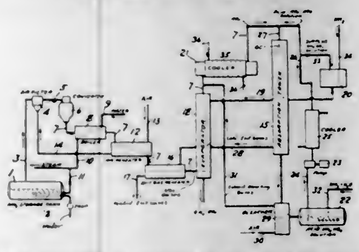
CHAIN COUPLING

John Seitzer, Clarkia, Idaho

Application April 13, 1937, Serial No. 136,661

2 Claims. (Cl. 24—116)

1. A coupling for securing the ends of a chain together comprising an elongated block-like coupling member having a longitudinal through slot therein for receiving one end of a link of a chain and a transverse slot bisecting the horizontal slot, a coupling bar having a hand grip end and a coupling end and swingably mounted on said block for manipulation to swing said coupling end into and out of said transverse slot and through said link, a latch cooperating with said hand grip end to block swinging movement of said coupling end out of said slot, said latch being pivotally mounted for snap action engagement with said hand grip end.



2,102,136

PROCESS AND APPARATUS FOR MANUFACTURING AMMONIUM NITRATE

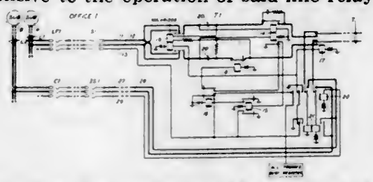
James H. Shapleigh, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application January 18, 1935, Serial No. 2,350

20 Claims. (Cl. 23—103)

1. The process of manufacturing an inorganic nitrate including catalytically oxidizing ammonia with air to form a mixture of nitric oxide and oxygen, cooling said mixture, effecting absorption of nitric oxides in a recirculating solution of the inorganic nitrate, and adding an alkali corresponding to the inorganic nitrate to the solution between the absorption passes thereof to react with nitric acid formed therein, the recirculating solution being maintained acid.

2,102,137



TELEPHONE SYSTEM

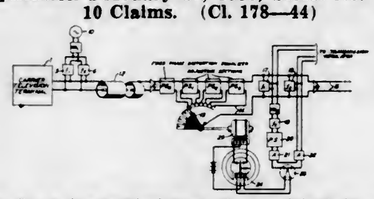
Arthur B. Sperry, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application June 25, 1936, Serial No. 87,184

6 Claims. (Cl. 179—16)

1. In a telephone system, a two-way trunk line, means at each end of said trunk for seizing said trunk on outgoing calls, a trunk relay at each end of said trunk, said relays being normally bridged across the conductors of said trunk for operation upon seizure of the trunk at the opposite end, a selector at one end of the trunk for use in completing calls incoming over said trunk, a line relay for said selector, a circuit closed by the operation of the trunk relay at said one end of the trunk for operating said line relay, and means responsive to the operation of said line relay for

transferring the conductors of said trunk from said trunk relay to said line relay.



2,102,138

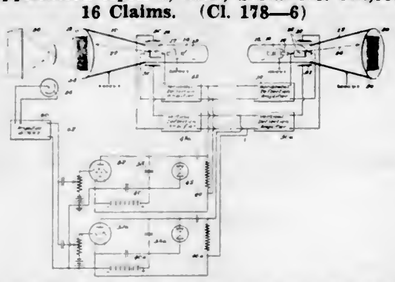
TRANSMISSION SYSTEM

Maurice E. Strieby, Maplewood, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application February 21, 1936, Serial No. 65,030

10 Claims. (Cl. 178—44)

4. In a transmission system subject to variations in phase distortion, means for transmitting over said system two pilot waves of different frequencies, and means responsive to variations in the relative velocities of propagation of said pilot waves.



2,102,139

TELEVISION SYSTEM

Arthur W. Vance, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware

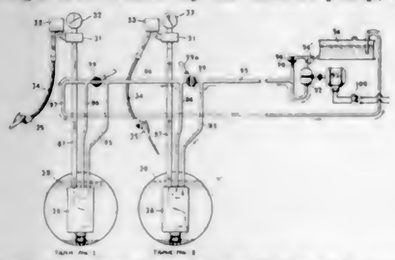
Application April 2, 1932, Serial No. 602,651

16 Claims. (Cl. 178—6)

1. In the art of television, the method of operation which comprises developing a stream of electrons and directing the same at screen structure, deflecting said stream to cause the same to scan said structure, and varying the average speed of deflection in accordance with variations in conditions of light and shade from elemental areas of the object being televised.

2,102,140

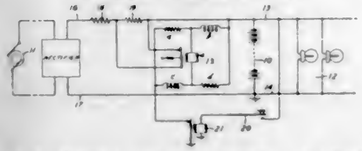
SYSTEM AND APPARATUS FOR PUMPING HAZARDOUS LIQUIDS



Gustave A. Ungar, Pelham Manor, N. Y.

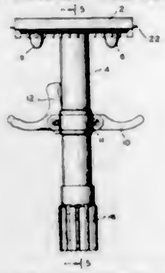
Application May 11, 1933, Serial No. 670,426

18 Claims. (Cl. 221—95)



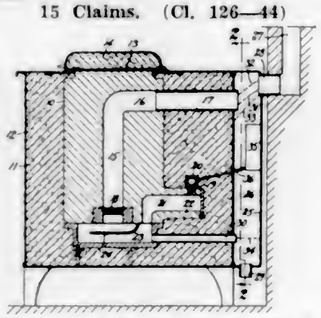
1. A pumping system for dangerous liquids comprising a master pump and connected conduit, a

remote motor-pump unit driven by liquid forced through the conduit by the master pump, and



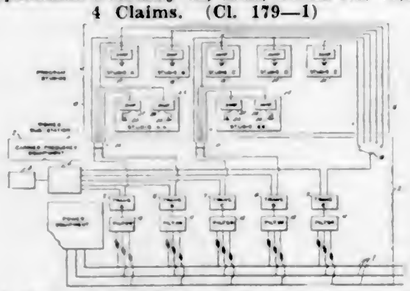
means for automatically disabling the master pump in case of a leak in the conduit.

2,102,141
BATTERY CHARGING SYSTEM
Harold N. Wagar, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application March 23, 1935, Serial No. 12,576
4 Claims. (Cl. 171—314)



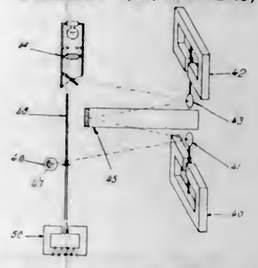
1. In a battery charging system, a battery, a source of current for charging said battery and means including a multi-winding relay for regulating the charging rate to said battery, said relay normally carrying, by way of one of its windings, a current of insufficient magnitude to cause its operation and the other windings constituting the four arms of a Wheatstone bridge circuit, certain thereof having positive temperature-resistance coefficients for causing the normal current carried by said one winding to vary coincidently with temperature variations.

2,102,142
SAFETY RAZOR
William E. Burnett, Ilion, N. Y.
Application October 22, 1936, Serial No. 106,966
6 Claims. (Cl. 30—41)



1. A safety razor comprising a handle having a guard secured thereon, a blade holder, a blade clamped between said blade holder and a member extending through said handle, said member having means thereon for cooperation with a latch member on said handle and means for resiliently holding said blade and blade holder in contact with said guard.

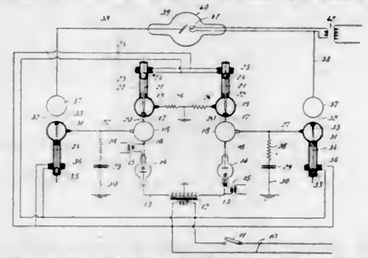
2,102,143
DRAFT REGULATION
Gustaf Dalén, Lidingo, Sweden, assignor to Svenska Aktiebolaget Gasaccumulator, Stockholm, Sweden, a corporation of Sweden
Application March 2, 1933, Serial No. 659,301
Renewed August 14, 1936. In Sweden March 2, 1932
15 Claims. (Cl. 126—44)



1. Fuel burning apparatus adapted to be operated with a natural draft chimney comprising means forming a chamber for air in communication with the chimney, a continuously open inlet for supplying air to the lower part of said chamber, means forming a combustion space and a flue for combustion gases connecting said space with the chimney, means for supplying fuel to said space and means for supplying substantially all of the combustion air required for burning the fuel in said space under all conditions of normal operation of the apparatus comprising a continuously open connection connecting said combustion space with said chamber at a place remote from the place of communication with the chimney and between the last mentioned place and said inlet, said chamber and said connection providing a continuously open path arranged to cause flue gases to flow from the chimney to said combustion space prior to flow thereof to said inlet upon continued back draft, and said chamber having such length and cross sectional area and configuration and being so arranged as to provide less resistance to flow of air therethrough than the resistance to flow of air and combustion gases through said connection, said combustion space and said flue.

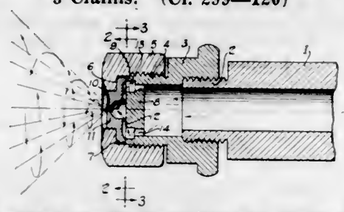
2,102,144
BINAURAL PROGRAM SYSTEM
Robert D. Duncan, Jr., East Orange, N. J., assignor to Wired Radio, Inc., New York, N. Y., a corporation of Delaware
Application February 11, 1936, Serial No. 63,461
4 Claims. (Cl. 179—1)

1. An electrical transmission system comprising, a transmission medium comprising a commercial power network, means for transmitting over said medium a plurality of channels comprising modulated discrete frequency bands, program means including at least two pick-up devices spatially positioned with respect to each other for picking up waves respectively in different auditory aspects, said pick-up devices operating to individually operate through said channels, and a plurality of receiving stations operatively associated with said medium for the selective reception of carrier frequencies transmitted thereover, one of said receiving stations being provided with a plurality of receiving means for simultaneously receiving from said different channels, and translating units respectively connected with said receiving means and spatially positioned in correspondence with the position of said pick-up devices, and another of said receiving stations being provided with receiving means for the reception at any one time of signals transmitted over said medium through one of said channels, said receiving means including power operated devices and connections from said network for supplying commercial power as well as signalling energy to said means.



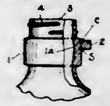
2,102,145
AUTOMATIC REGULATOR
Jean Fallou, Montrouge, France, assignor to Compagnie pour la Fabrication des Compteurs & Materiel d'Usines a Gaz, a corporation of France
Application August 3, 1935, Serial No. 34,639
In France August 4, 1934
4 Claims. (Cl. 250—41.5)

1. In a regulating system for an electric circuit, the combination of two distinct instruments for measuring different factors of said circuit, respectively, associated with said circuit, a photo-electric cell in said circuit adapted to control said circuit, and optical means, including a source of light, and an optical element associated with each of these measurement instruments, for controlling the action of a light beam on said photo-electric cell as a function of the respective values of both of the factors measured by said instruments.



2,102,146
X-RAY APPARATUS
Harry D. Garretson, Long Island City, N. Y.
Application July 13, 1934, Serial No. 734,926
6 Claims. (Cl. 250—34)

1. In an X-ray circuit for making bucky radiographs, a transformer, an X-ray tube, a control switch for interrupting a source of current leading to the transformer, a pair of normally closed switches between the transformer and tube, a pair of normally open switches in said circuit, a pair of condensers, rectifying means between the transformer and condensers one plate of each condenser being connected to a contact of one of the closed switches and also to a contact of one of the open switches, the other plate of each of the condensers being grounded, the

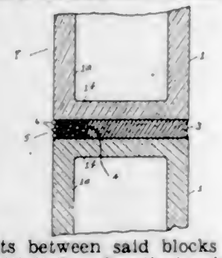


second contact of each of the closed switches being grounded and the second contact of each of the open switches being connected to the anode and cathode respectively of the X-ray tube.

2,102,147
ATOMIZER
Warren C. Graham, New York, N. Y.
Application March 15, 1937, Serial No. 130,877
5 Claims. (Cl. 299—120)

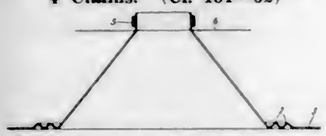
1. A spray nozzle comprising in combination, a sprayer tip having an orifice and tangential slots communicating therewith, a whirl chamber behind the sprayer tip and communicating with the slots, and means for delivering whirling liquid to said whirl chamber.

2,102,148
BOTTLE
James M. Guthrie, Pittsburgh, Pa., assignor of one-third to Joseph C. Keaney, Mount Lebanon, Pa.
Application December 2, 1935, Serial No. 52,473
3 Claims. (Cl. 215—7)



1. A glass bottle including a frangible lug integrally formed on its neck and extending angularly therefrom for cooperation with a closure element, said lug being substantially unconstricted in the immediate region of its base and forming with the surface of the bottle neck a clean unfilleted corner, and a surface scoring in the glass in said corner, whereby the lug, when fractured, breaks on a clean conchoidal surface lying within the surface of the normal lug-supporting body portion of said neck.

2,102,149
GLASS MASONRY
James M. Guthrie, Mount Lebanon, Pa., assignor of one-half to Joseph C. Keaney, Mount Lebanon, Pa.
Application April 22, 1937, Serial No. 138,392
5 Claims. (Cl. 72—41)

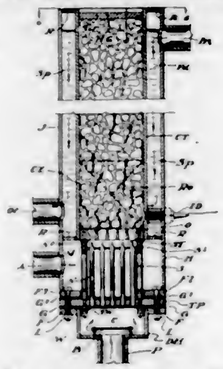


1. A building wall of masonry including trans-

lucent blocks of glass laid-up with mortar comprising small, translucent crystalline bodies bonded with a translucent cement, said mortar

in the joints between said blocks providing in effect a multiplicity of optical prisms receiving light transmitted through the bodies of said blocks.

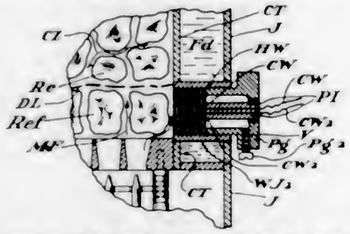
2,102,150
DIAPHRAGM
Arthur Hammer, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application December 26, 1935, Serial No. 56,140
In Germany November 6, 1934
4 Claims. (Cl. 181—32)



1. A diaphragm for acoustic devices made from mouldable fibrous material which has been treated with an albuminous solution.

2,102,151
METHOD OF MANUFACTURING METALLIC SODIUM
Ryosaburo Hara and Suyekichi Abe, Sendai, Japan, assignors to Asahi Garasu Kabushiki Kaisha, Tokyo, Japan, a corporation of Japan
No Drawing. Application July 23, 1935, Serial No. 32,721
2 Claims. (Cl. 204—1)

1. A method of manufacturing metallic sodium which consists, in combination, in dissolving sodium chloride in liquid ammonia and electrolyzing the solution, utilizing a permeable (or semi-permeable) inorganic diaphragm and a metallic cathode of the group consisting of Al, Mg, Cd, Sn, Zn and amalgamated zinc catalytically accelerate the formation of sodium amide which tend to take place between the metallic sodium and liquid ammonia, and evaporating the indigo blue catholyte after being separated from the anolyte, to liberate metallic sodium having a bright metallic lustre.

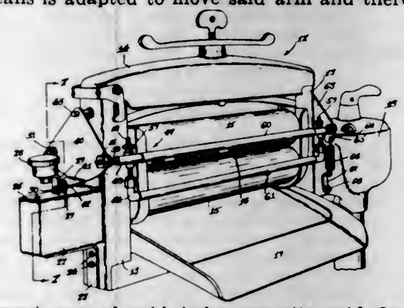


2,102,152
PREMIXING DEVICE FOR FLUID FUEL BURNERS
Joseph W. Hays, Tulsa, Okla.
Application January 25, 1933, Serial No. 653,468
5 Claims. (Cl. 158—118)

1. In a device for delivering a combustible mixture of a fuel and combustion-supporting gas to a furnace chamber containing an apertured refractory mass, the combination of a plurality of fuel injecting nozzles directed into the furnace adjacent said refractory mass, means for supplying fuel under pressure to said nozzles, means for directing a combustion-supporting gas into the furnace chamber adjacent the nozzles, whereby

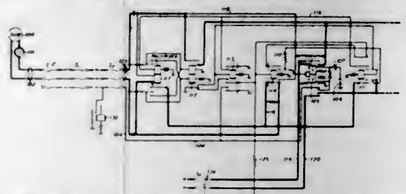
the fuel and the combustion-supporting gas impinge upon the refractory mass and are thoroughly mixed and means for igniting the mixture initially at the point of mixture.

2,102,153
IGNITION APPARATUS FOR CLOSED-SYSTEM FLUENT-COMBUSTIBLE BURNERS
Joseph W. Hays, Tulsa, Okla.
Application March 18, 1933, Serial No. 661,627
8 Claims. (Cl. 158—99)



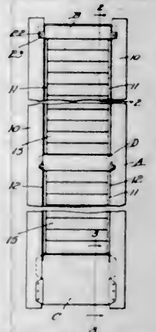
1. A heater, adapted to burn a fluent explosive mixture, comprising a combustion chamber, a refractory catalyst in said combustion chamber, means for supplying an explosive mixture to said combustion chamber, a recessed housing opening into said combustion chamber, a vent from said housing to the outside air, a movable stopper in said vent, and a hot wire igniting element in said housing.

2,102,154
SAFETY DEVICE FOR WRINGERS
Ernest C. Hill, Medford, Mass.
Application August 15, 1935, Serial No. 36,289
5 Claims. (Cl. 192—133)



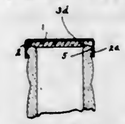
1. A safety device comprising movable lever means embodying an arm extending outwardly and having a plurality of holes therein, spring means connected to and adapted to hold said lever means in a predetermined position, electrical switching instrumentalities embodying a finger adapted upon actuation to open and close said instrumentalities and adapted to enter said holes, and a spring operatively connected to said finger, said finger bearing against the under side of said arm between said holes under tension of said spring when said lever means is in said predetermined position, and guard means connected

to said lever means movement of which guard means is adapted to move said arm and thereby



present one of said holes opposite said finger whereby said finger may enter said hole.

2,102,155
TELEPHONE SYSTEM
Henry Hovland, Williston Park, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 25, 1936, Serial No. 87,194
7 Claims. (Cl. 179—16)



1. In a telephone system, a trunk circuit, means for seizing said circuit at either end, a guard circuit including one of the conductors of said trunk closed by said seizing means upon the seizure of one end of said trunk, and a relay in said guard circuit at the other end of said trunk having a contact for placing a busy condition upon said trunk at said other end.

2,102,156
WINDOW SHUTTER
Frank Kalb, Sr., Baltimore, Md.
Application June 2, 1937, Serial No. 146,056
1 Claim. (Cl. 20—63)

A shutter of the kind described comprising spaced longitudinally disposed parallel rails and outer and intermediate cross connecting members between the said rails and each formed from a blank of sheet material bent to provide an intermediate diagonally disposed web with reversely arranged horizontal upper and lower ledges having inturned ears at opposite ends of the latter at right angles thereto for separable fastening to said rails, and reversely bent triangular portions at opposite ends of the webs with attaching ears overlapping said rails at opposite sides thereof and separably secured thereto.

2,102,157
BOTTLE CLOSURE
Joseph C. Keaney, Mount Lebanon, and James M. Guthrie, Pittsburgh, Pa.
Application July 22, 1936, Serial No. 91,898
4 Claims. (Cl. 215—56)

1. A crown cap including a compressible gasket adapted to be secured in gas-sealing position upon the mouth of a bottle, said gasket as assembled in said cap including in its body a gas-venting recess which in service is normally sealed from the interior of said bottle and adapted automatically to communicate with the interior of said bottle in response to excessive pressure therein, substantially as described.

2,102,158
BOTTLE CLOSURE
Joseph C. Keaney, Mount Lebanon, and James M. Guthrie, Pittsburgh, Pa.
Original application July 22, 1936, Serial No. 91,898. Divided and this application January 25, 1937, Serial No. 122,104
5 Claims. (Cl. 215—56)

1. In combination with a bottle containing liquid under gaseous pressure, a crown closure secured upon and sealing the mouth of said bottle, said closure comprising a metal cap with a skirt portion for clinching the cap in assembly upon the lip of said bottle mouth, said cap including a gasket portion of compressible material peripherally compressed against said bottle lip, a recess provided in the assembled closure structure, a normally open passage for the escape of air from said recess to the outer atmosphere, and a normally impervious diaphragm portion secured in gas-sealing position between said recess and the interior of said bottle, the body of said normally impervious diaphragm portion being formed of relatively inelastic, rupturable material and including a medial body portion movable relatively to said compressed gasket and into diaphragm-rupturing position in said recess in response to excessive pressure within said bottle, whereby said gasket automatically ruptures and relieves pressure within the bottle.

2,102,159
PROCESS OF PRODUCING ACETIC ANHYDRIDE
Martin Mugdan and Johann Sixt, Munich, Germany, assignors to Consortium für Elektrochemische Industrie, G. m. b. H., Munich, Germany, a corporation of Germany
No Drawing. Application November 11, 1935, Serial No. 49,253. In Germany November 13, 1934
7 Claims. (Cl. 260—123)

1. The process for producing acetic anhydride, which comprises heating acetic acid at a tem-

perature above 800° C. in the presence of a phosphorus-containing catalyst gaseous at the reaction temperature and maintained under reaction conditions so that the catalyst is substantially all in the gaseous state.

2,102,160

PROCESS FOR THE PRODUCTION OF FORMALDEHYDE FROM METHANE

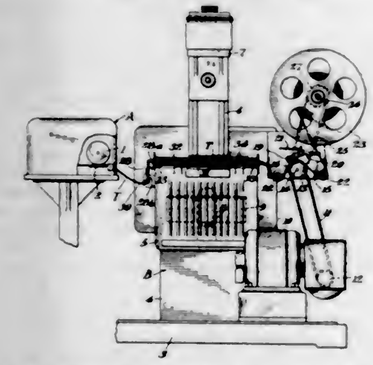
Paul Nashan, Oberhausen, Germany, assignor to the firm Gutehoffnungshutte Oberhausen Aktiengesellschaft, Oberhausen - Rheinland, Germany

No Drawing. Application March 15, 1934, Serial No. 715,697. In Germany March 15, 1933

1 Claim. (Cl. 260—138)

In the production of formaldehyde from methane by the action of oxygen, the process which comprises passing a gaseous reaction mixture containing methane and oxygen together with nitrogen oxides in amount less than 1 per cent by volume, calculated as NO, serving as gaseous catalysts, at a temperature of 600° to 700° C., over a hot oxidation-controlling catalyst mixture comprising an alkaline earth metal oxide in conjunction with a metal oxide catalyst which, when used alone, accelerates oxidation of methane, said mixture serving to prevent substantial oxidation of the formaldehyde into undesirable products at the stated high temperature, and recovering formaldehyde from the effluent gases.

2,102,161



PROJECTION APPARATUS

David F. Newman, Rockville Centre, N. Y., assignor to Trans-Lux Corporation, a corporation of Delaware

Application August 12, 1932, Serial No. 628,529

Renewed May 13, 1937

3 Claims. (Cl. 88—24)

1. A structure forming a projection field through which a character-bearing tape is drawn after ejection from a printing mechanism, said structure comprising members spaced apart to form a path therebetween for the passage of said tape, and a rib immovably fixed to and projecting from one of said members toward the other member, said rib extending longitudinally of said one member and being disposed substantially at the center thereof so as to be adapted to engage the tape substantially at its longitudinal center and hold the tape toward said other member, said structure being transparent to light throughout substantially the entire length thereof.

2,102,162

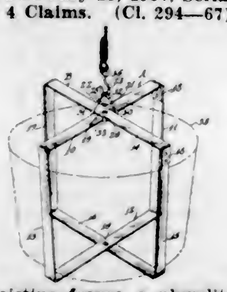
METHOD OF PRODUCING ETCHED SURFACED SHELLS AND CASINGS

Albert Nierenberg, New York, N. Y.

Application February 21, 1936, Serial No. 65,073

5 Claims. (Cl. 41—18)

2. A method of producing deep drawn surface etched shells, or the like, comprising printing a design on a sheet, applying a protective coating to the design, etching out the surfaces not involved in the design, applying a flexible enamel background coating to the surface of the sheet, including the protected design and the etched out portion thereof, deep drawing the sheet to impart a shell formation thereto, superimposing a coating of hard enamel over that of flexible enamel, and removing the coating and protective material from the protected design, and thereafter plating or otherwise treating that portion of the shell surface not incorporating the enamel background.



2,102,163

COLLAPSIBLE HOISTING FRAME

Henry A. Pasternack, Brooklyn, N. Y., assignor to David Levow, New York, N. Y.

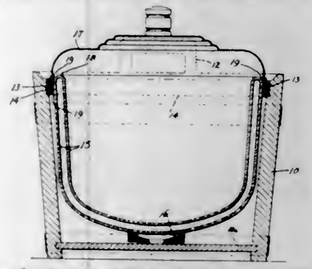
Application February 18, 1937, Serial No. 126,342

4 Claims. (Cl. 294—67)

1. In a hoisting frame, a plurality of support members capable of nesting one within the other, means for mounting said members to permit angular displacement thereof to form an enclosing cage, and means adapted to be positioned at the respective apices defined by the support members when disposed in angular relationship, for rigidly locking the supports and maintaining said enclosing cage formation.

2,102,164

HEAT INSULATED RECEPTACLE



Arthur H. Payson and Charles O. Duevel, Jr., Norwich, Conn., assignors to The American Thermos Bottle Company, Norwich, Conn., a corporation of Ohio

Application July 27, 1935, Serial No. 33,544

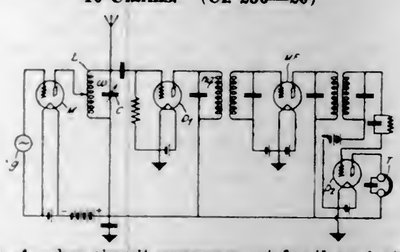
4 Claims. (Cl. 220—15)

1. A heat-insulated receptacle comprising a substantially tub-shaped outer casing having an annular groove at the top, a substantially tub-shaped double-walled container in said casing, there being a narrow annular space between the adjacent walls of the casing and container, a compressed rubber gasket seated in said groove and having a flat inner surface shaped to engage the top of said container in pressure contact sufficient to hold the container firmly suspended in the casing, the vertical depth of said gasket being greater than its horizontal thickness so as to engage the container along a relatively wide

contact area for securely supporting the container, said rubber gasket being cemented in its compressed state to said container along the annular area of contact, whereby the container is permanently sealed to the gasket and locked against axial displacement in the casing, the circular top of the container being substantially flush with or projecting only slightly above the

gasket, which is positioned to form a closure for the top of said annular space, and a compressible stop at the bottom of the casing to engage the bottom of the container and thereby gauge the space between the bottoms of the container and the outer casing, said gasket supporting the container in the casing independently of said stop.

2,102,165



RADIO CIRCUITS

Klaas Posthumus, Eindhoven, Netherlands, assignor to Radio Corporation of America, a corporation of Delaware

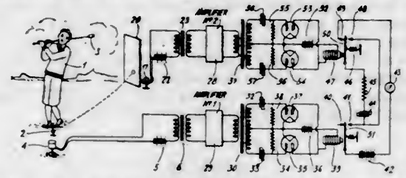
Application December 8, 1933, Serial No. 701,434

In Germany December 12, 1932

10 Claims. (Cl. 250—20)

1. A relay circuit arrangement for the selective reception of electrical oscillations comprising a tuned input circuit for said relay, means for periodically varying the damping of said tuned circuit and a filter circuit for a multiple of the damping frequency connected in the output of the relay.

2,102,166



VELOCITY MEASURING DEVICE

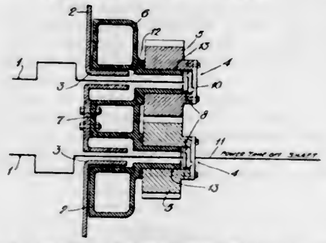
Walter van B. Roberts, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application February 25, 1933, Serial No. 658,654

3 Claims. (Cl. 161—18)

1. In an internal measuring device, a pick-up means responsive to energy waves, a circuit including at least one electronic device coupled to the pick-up means, a relay associated with said circuit, a condenser, a charging circuit for said condenser, means controlled by the relay for initiating a charging action on the condenser, a second pick-up means responsive to energy waves, a circuit including at least one electronic device coupled to the last named pick-up means, a relay associated with the last named circuit, means controlled by said last named relay for stopping the charging action on said condenser and discharging the same and means for indicating the

extent of the charge placed on the condenser comprising a ballistic galvanometer having a relatively slow period connected in the condenser charging circuit and adapted to measure the extent of the charge placed on the condenser.



2,102,167

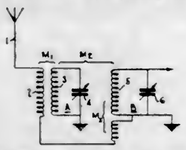
GEAR DRIVE

Max Rotter, Milwaukee, Wis., assignor to Busch-Sulzer Bros.-Diesel Engine Company, St. Louis, Mo., a corporation of Missouri

Application July 31, 1936, Serial No. 93,537

4 Claims. (Cl. 74—411)

1. In a gear drive, the combination of twin shafts journalled in a common frame, a toothed gear wheel aligned with and flexibly connected to each of said shafts, a supplemental frame on which said wheels are journalled, said frame being secured to the main frame at a point intermediate of said shafts and wheels, and each being free to expand independently of the other in opposite directions from said point and said wheels having an expansion coefficient corresponding to that of the supplemental frame adapted to neutralize the effect of its expansion.

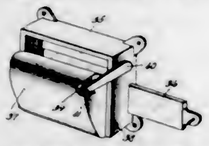


2,102,168

RADIO RECEIVING SET

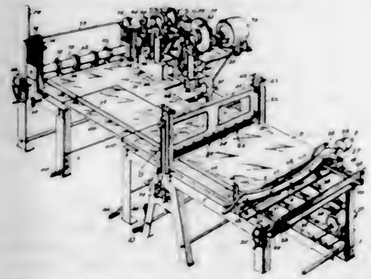
Stuart W. Seeley and Garrard Mountjoy, Jackson, Mich., assignors, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application January 29, 1932, Serial No. 589,596



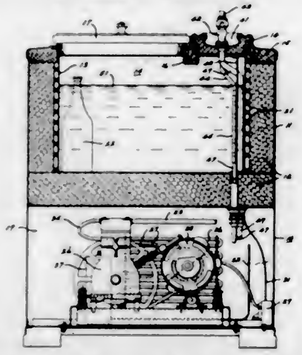
8 Claims. (Cl. 250—20)

1. In superheterodyne receiving sets, a source of signal frequency, an oscillator adapted to beat with the signal frequency derived from said source, an inductance-capacity loop tuned to the



signal frequency, a detector having means to connect it across points in said loop, there being a magnetic coupling between said source and said loop and a capacitatively reactive circuit coupled between the signal source and said loop having a capacitative reactance value that produces across said points a voltage of the image of said signal frequency equal in value and opposite in phase to the image voltage produced thereacross through said magnetic coupling to prevent the beating action between the oscillator and image frequencies from affecting the detector.

2,102,169
CASHIER'S PROTECTOR
Ludwig R. Städtler, New York, N. Y., assignor of one-half to Leonard Quent, Brooklyn, N. Y.
Application December 21, 1935, Serial No. 55,504
1 Claim. (Cl. 20—1.01)

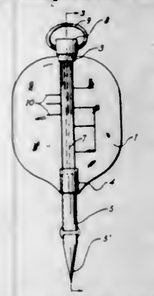


In a protective device for a cashier's room having a customers' compartment adjacent and an impregnable wall therebetween provided with a window having a frame, a convexly curved impregnable shutter pivoted at its lower edge to said frame, a lever pivoted to said frame near its upper part, a roll carried by said lever to contact said shutter whereby it may be swung upwardly to close the window space, a handle on said lever, all of said elements extending into the cashier's room and a metal slide movable to close the window.

2,102,170
PAPER MACHINERY
Isaac Stern, New York, N. Y.
Application November 17, 1934, Serial No. 753,441
4 Claims. (Cl. 164—11)

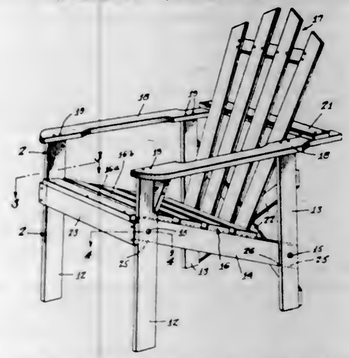
1. In combination in a unitary structure, a scorer for engaging a sheet of blank material; a source of power; eccentric straps for translating the power from said source to said scorer for scoring said sheet of material; a metal pair of vertical guides for guiding said scorer in a vertical path; a plurality of rotary scorers; means for applying power from said source to said scorers for producing flap scores; a plurality of rotary trimmers; means for supplying power to said trimmers for trimming said sheets of material; adjustable block and cut-out means; separate power means therefor; and means for controlling the application of power thereto for blocking and cutting said blanks.

2,102,171
REFRIGERATING APPARATUS
Bernard J. Vandoren, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application February 24, 1936, Serial No. 65,323
1 Claim. (Cl. 62—141)



A unitary refrigerating apparatus comprising in combination, a cabinet having a plurality of walls forming an insulated compartment for the reception of articles to be stored and cooled and a machine compartment below the insulated compartment, a closed refrigerating system associated with said apparatus including an evaporator disposed in heat exchange relation with the interior of said insulated compartment and a refrigerant liquefying and circulating unit mounted in the machine compartment of said cabinet, the top wall of said insulated compartment including a detachable portion stationarily secured to said cabinet and a movable portion, said movable portion of said compartment top wall forming a door providing access to the interior of the insulated compartment, a beverage dispensing device associated with said apparatus, said device including a relatively flat closed fluid conducting portion disposed within said insulated compartment along a side wall thereof and attached to the stationarily mounted detachable portion of the compartment top wall, a conduit connecting said portion of said device with a source of fluid supply exteriorly of said insulated compartment, a faucet mounted exteriorly of the insulated compartment on the stationarily mounted detachable portion of the top wall thereof and having a conduit connection with said portion of said device within the compartment, and said insulated compartment having a body of liquid therein for transferring heat from said portion of said beverage dispensing device and from articles stored within the compartment to said evaporator of the refrigerating system.

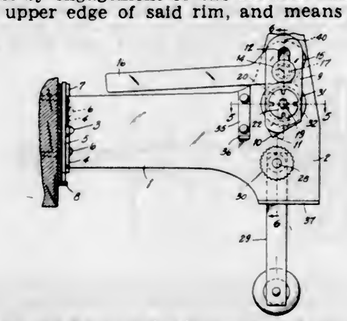
2,102,172
THERMOMETER
Ralph C. Wappner, Springfield, Ohio
Application November 13, 1936, Serial No. 110,693
3 Claims. (Cl. 73—352)



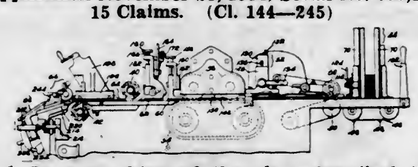
2. In a thermometer, a substantially flat enlarged head having a vertically extending open-front channel, a hollow sleeve at the lower end of said head communicating with said channel, a hollow boss at the upper end of said head also communicating with said channel, a tubular elongated closed casing secured in the bore of said sleeve with a tight drive fit, a thermometer tube located in said channel and said casing, said

head extending laterally of said channel to provide spaces for temperature indicia, and a cap

secured to the exterior of said bore with a tight drive fit.



2,102,173
CHAIR
Roy H. Williams, Taunton, Mass.
Application March 1, 1937, Serial No. 128,302
3 Claims. (Cl. 155—191)

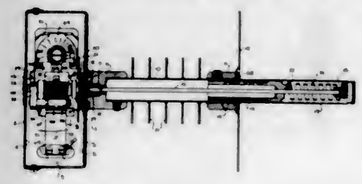


3. A chair comprising two front legs and two rear legs with bars extending between the front and rear legs and to the front edges of the front legs, and a reinforcing piece extending between said front legs and having rebated extremities into each of which a front leg and the extremity of one said bars secured thereto, is fitted, said bars extending diagonally downward from the respective front legs to the rear legs and fitted in diagonal recesses formed in the inner sides of said front and rear legs.

2,102,174
CAN OPENER
Walter E. Aeschbach, St. Louis, Mo.
Application June 15, 1936, Serial No. 85,292
9 Claims. (Cl. 30—8)

1. In a can opener, in combination with a support, a driving wheel rotatably mounted in fixed position directly thereon, a cutter slidably mounted on the support, a friction wheel, positioned above said driving wheel, and a contact member carried by the cutter, a handle-operated cam pivotally mounted on said support and adapted to be turned into engagement with said contact member to force said cutter and friction wheel downward, whereby a can having its rim inserted between the two wheels will be punctured by the cutter and have the under side of its rim forced into engagement with said driving wheel by engagement of the friction wheel with the upper edge of said rim, and means for rotating said driving wheel to cause it to rotate the top of the can against said cutter.

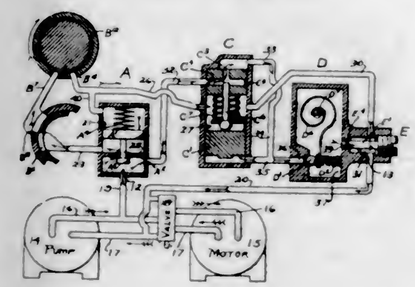
2,102,175
MOLDER
Laurence E. Blood, Newton, Mass., assignor to S. A. Woods Machine Company, Boston, Mass., a corporation of Massachusetts
Application November 28, 1934, Serial No. 755,185
15 Claims. (Cl. 144—245)



1. In a machine of the class described the mechanism for separating successive pieces of stock from a supply and advancing them for delivery to the molding mechanism proper comprising a hopper, rails beneath and constituting a bottom for the hopper at either side thereof, fences above said rails, the front of the hopper at the bottom being separated from the fences by spaces, a chain having a run between the rails, and feed dogs carried by the chain having ends overlying the rails to move through said spaces.

14. A machine of the class described comprising successive upper and lower cutter heads for operating on the faces of the stock, substantially continuous longitudinal supporting rails to underlie the lateral edges of the stock and extending substantially to the lower head, means for supporting a stack of work pieces between said rails including fences disposed over said rails and presented to the leading edge of the work pieces adjacent their outer margins solely, defining an exit opening controlling the delivery of the pieces therethrough by the edge portions thereof means operating above said rails and between the rails and said fences, respectively, for delivering successively lowermost pieces of the pile through the opening, and subsequent feeding means for engaging the central portion of the pieces as supported by the rails for forwarding the same from said delivery means in an end-butted row to the cutter heads.

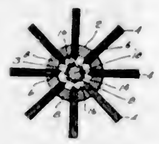
2,102,176
CONTROL MEANS
Earnest J. Dillman, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application May 26, 1934, Serial No. 727,779
21 Claims. (Cl. 200—138)



1. A device of the character described, comprising a supporting structure, an operating

shaft journaled in said structure, means to rotate said shaft, control means carried by said structure and including an operating lever, an operating arm journaled about said shaft and

intermediate its ends for transmitting movement to said lever, resilient means carrying said lever and opposing movement of said lever in one direction, and a spring operatively connecting said shaft and said arm.

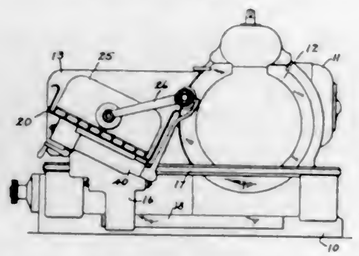


2,102,177
SPEED CONTROLLER FOR HYDRAULIC MOTORS
James K. Douglas, Milwaukee, Wis., assignor to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin
Application December 24, 1934, Serial No. 758,966
14 Claims. (Cl. 60—52)

1. The combination, with a hydraulic motor, a pump normally delivering motive liquid at a rate in excess of the rate required to drive said motor at a predetermined speed, a pressure channel for directing motive liquid from said pump to said motor and a return channel for directing exhaust liquid from said pump to said motor, of a slip compensator connected between said pressure channel and said return channel and comprising means for subtracting liquid from the output of said pump at a limited rate and responsive to variations in pump pressure to vary said limited rate inversely to said variations in pressure, and a second means connected in parallel with the aforesaid means for subtracting liquid from the output of said pump at a limited volumetric rate and responsive to variations in the temperature of the liquid delivered by said pump to vary said volumetric rate inversely to said variations in temperature.

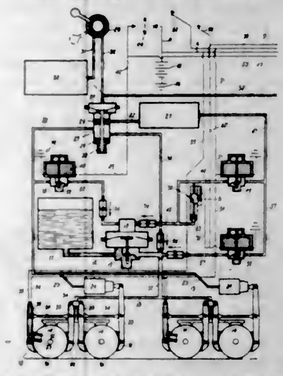
2,102,178
BRUSH
Charles C. Gerhardt, Douglas Manor, N. Y.
Application May 29, 1931, Serial No. 540,925
4 Claims. (Cl. 15—183)

1. A rotary wire brush comprising a brush body having an open center, slots extending lengthwise of said body and connecting the periphery with said open center, tufts of U-shaped bristles contiguous in said slots from end to end, each bristle having one leg of its U in one slot and the other



leg in another slot and adjacent bristles of each tuft being connected at their U bends independently of the brush body.

2,102,179
POLYMERIZATION PRODUCTS FROM STYRENE AND THEIR PRODUCTION
Heinrich Hopff, Ludwigshafen-on-the-Rhine, and Fritz Schmidt, Troisdorf, near Cologne, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application June 9, 1936, Serial No. 84,302. In Germany June 19, 1935
5 Claims. (Cl. 260—2)



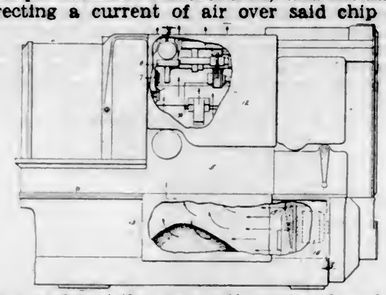
1. A process of producing polymerization products from styrene which comprises subjecting styrene together with from 0.5 to 5 per cent of a polymerizable aliphatic nitrile selected from the group consisting of acrylic acid nitrile and methacrylic acid nitrile to polymerization.

2,102,180
FOOD HANDLING APPARATUS
Herbert L. Johnston, Troy, Ohio, assignor to The Hobart Manufacturing Company, Troy, Ohio, a corporation of Ohio
Application February 23, 1934, Serial No. 712,580
13 Claims. (Cl. 146—102)

1. A slicing machine of the character described comprising a rotary knife, a carriage for holding the material to be sliced, means for mounting the carriage for reciprocating movement with respect to said knife, a pusher plate, means for mounting said pusher plate for swinging movement into and out of said carriage and for movement toward and away from said knife from a position at the remote end of said carriage into a position in close juxtaposition to the plane of said knife, torsional spring means mounted in a protected and substantially enclosed position beneath the plane of said carriage and means pivotally mounted on said carriage interconnecting said spring means and said pusher plate mounting means and operable throughout the range of movement of said pusher plate for urging said pusher plate toward said knife.

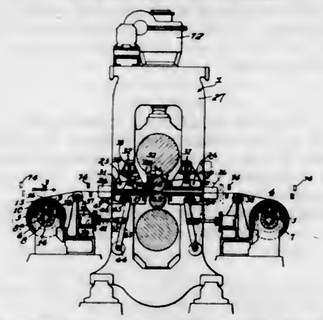
2,102,181
WHEEL COOLING APPARATUS
George McCormick, Redwood City, Calif.
Application December 14, 1936, Serial No. 115,794
12 Claims. (Cl. 188—264)

1. In a railway vehicle having an air operated brake and a valve for controlling the supply of air thereto, means for cooling the wheels of the vehicle comprising a pipe for conducting cooling fluid to said wheels, a valve in said pipe, means for operating said valve by air pressure, a connection between the brake controlling valve and the operating means of the cooling fluid valve, whereby said cooling fluid valve is automatically operated simultaneously with the brake, and a second connection between said brake valve and said cooling fluid pipe whereby air is admitted to said pipe to eject the cooling fluid therefrom after the closing of said cooling fluid valve.



2,102,182
REFRIGERATOR CAR
John H. McCormick, Williamsport, Pa.
Application February 6, 1936, Serial No. 62,613
7 Claims. (Cl. 62—24)

3. In a refrigerator car having a storage compartment and an ice bunker therein, a pair of fans for circulating cooling air in the storage compartment, means for driving the fans actuated by a movement of the car, the blades of one of said fans being so disposed with respect to the blades of the other fan that one fan may discharge air into said compartment while the other fan is substantially idly rotating, said driving means operable to actuate the fans to produce an effective discharge of air regardless of the direction of movement of the car.

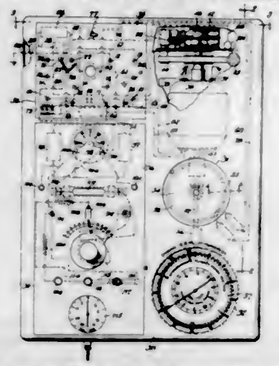


2,102,183
METALWORKING MACHINE
Donald H. Montgomery, Berlin, Conn., assignor, by mesne assignments, to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application November 18, 1933, Serial No. 698,612
4 Claims. (Cl. 29—57)

1. A metal working machine, comprising a frame, relatively movable work and tool holders, a chip container therebeneath, and means for directing a current of air over said chip con-

tainer and past the space adjacent said work and tool holders.

2,102,184
METHOD AND APPARATUS FOR ROLLING METALLIC STRIP
Julian E. Montgomery, Cleveland, Ohio, and John T. Flaherty, Pittsburgh, Pa., assignors to United Engineering & Foundry Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 20, 1935, Serial No. 41,460
18 Claims. (Cl. 80—43)



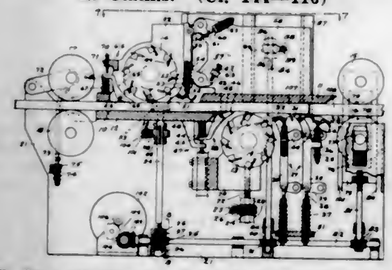
1. A strip mill comprising a roll stand, means for driving said roll stand in opposite directions, means at opposite sides of said stand for handling the strip and tensioning it while it is engaged in the roll stand, means interposed between said handling means and the roll stand and operative adjacent the roll pass thereof for gripping the strip and positively feeding it into the mill rolls and tensioning it as soon as it is engaged therein, and means for moving said gripping and tensioning means toward and from the roll stand.

2,102,185
APPARATUS FOR THE ANALYTICAL TESTING OF INTERNAL COMBUSTION ENGINES
John D. Morgan, South Orange, N. J., and Percy Bigmore Levitt, Bayside, N. Y., assignors to Powers Patents Company, Jersey City, N. J., a corporation of Maine
Application September 6, 1935, Serial No. 39,366
3 Claims. (Cl. 175—183)

1. A testing apparatus for analyzing the operation of internal combustion engine parts comprising a disc having a translucent peripheral portion, an electric lamp disposed adjacent the periphery of said disc so that its illumination may be observed through the translucent portion of said disc, motor means for causing a relative

movement between the disc and lamp, electrical means connecting said lamp to the engine in such a manner that it is periodically energized in accordance with the speed of the engine, dial means operatively associated with said first named means for indicating the rate of relative move-

ment between said disc and lamp, and a second lamp arranged to be periodically energized by impulses in accordance with the speed of said motor means, and provided with flexible leads whereby the lamp may be utilized to stroboscopically analyze the action of the component parts of the combustion engine.



2,102,186

WOOD PLANING MACHINE

Frederick A. Nicholson and Wilmot T. Pritchard, Seattle, Wash., assignors to Stetson-Ross Machine Company, Seattle, Wash., a corporation of Washington

Application July 20, 1936, Serial No. 91,568

12 Claims. (Cl. 144—116)

7. In a planing machine, the combination of a first bed and an opposite second bed forming therebetween a longitudinal passage for moving lumber, said beds forming means for limiting the movement of lumber in opposite directions; a planing device operatively positioned opposite one of said beds, said planing device cutting in a plane more adjacent the said one bed than the distance between beds; a second planing device operatively positioned opposite the other of said beds; a pressure means in advance of each of said planer devices to hold the work against the beds respectively; and a resilient pressure means located opposite the rear portion of the first of said beds and between the first planer device and the front end of the second bed, the said resilient pressure means and the pressure means in advance of the second planer device acting to flex the lumber as it passes from one bed to the other bed.

12. The method of preventing end snipping of lumber in double surfacing machines comprising, providing a longitudinal passageway for moving lumber between opposed bed plates having longitudinally spaced lumber supporting surfaces; longitudinally flexing the lumber between the two bed plates having longitudinally spaced lumber supporting surfaces causing the lumber in one portion of its travel to engage one surface thereof with one bed plate and in another portion of its travel to engage the other surface thereof with the other bed plate; and subjecting the non-engaging surface of the lumber to a planing device at that portion of the travel of the lumber when the opposite surface is engaging one of the bed plates.

2,102,187

METHOD OF ACCELERATION OF GELATINIZATION OF CELLULOSE NITRATE AND LIQUID NITRIC ESTERS AND THE PRODUCT THEREOF

James T. Power, Wilmington, Del., and Kenneth R. Brown, Tamaqua, Pa., assignors to Atlas Powder Company, Wilmington, Del., a corporation of Delaware

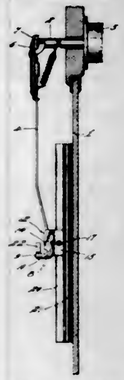
No Drawing. Original application January 6, 1934, Serial No. 705,622. Divided and this application October 30, 1934, Serial No. 750,736

14 Claims. (Cl. 52—22)

5. The process of gelatinizing cellulose nitric esters with liquid explosive nitric esters which comprises bringing about the gelatinization in the presence of an accelerator comprising at least one of the group of compounds derivable from a polyhydric alcohol having not more than 3 hydroxyl groups by replacing at least one of the hydroxyl groups by an alkoxy group containing not more than 4 carbon atoms, and replacing all of any remaining hydroxyls by a monobasic acid radical taken from the group consisting of the radicals of paraffin acids containing not more than 4 carbon atoms, and nitric acid radical.

9. A composition of matter comprising a cellulose nitric ester gelatinized with a liquid explosive nitric ester in the presence of a minor proportion of an accelerator comprising at least one of the group of compounds derivable from a polyhydric alcohol having not more than 3 hydroxyl groups by replacing at least one of the hydroxyl groups by an alkoxy group containing not more than 4 carbon atoms, and replacing all of any remaining hydroxyls by a monobasic acid radical taken from the group consisting of the radicals of paraffin acids containing not more than 4 carbon atoms, and nitric acid radical.

2,102,188



WINDSHIELD WIPER

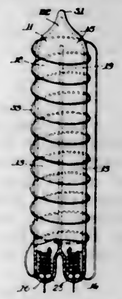
Michael Romano, Providence, R. I.; Adeline Romano administratrix of said Michael Romano, deceased

Application February 13, 1935, Serial No. 6,280

2 Claims. (Cl. 15—250)

1. In a windshield wiper mechanism, a wiper blade comprising a channel shaped holder member, a solid wiper element of uniform construction throughout its extent having a transversely curved wiper portion, a flattened fin-like part carried by said holder member, and a portion of less thickness than the main body portion of said fin-like part located adjacent to said wiper portion for permitting flexing of said wiper portion relative to the main body portion of said fin-like part, and flexible ribs extending outwardly from and radially of the transversely curved portion of said wiper element and bendable into overlapping relation with each other for multiple and successive contact with the windshield as the wiper blade is

pressed into contact therewith and the curved portion of the blade is displaced laterally relative to the fin-like part in its movement across the windshield.



2,102,189

GASEOUS CONDUCTION DEVICE

Robert E. Barclay, Chicago, Ill., assignor to Federal Electric Company, Inc., Chicago, Ill., a corporation of New York

Application January 15, 1934, Serial No. 706,670

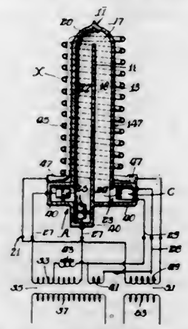
35 Claims. (Cl. 176—122)

6. A discharge device comprising means forming an elongated channel having longitudinally extending dielectric means associated with said channel, said channel having associated means permitting electrical discharge in said channel and an exciter comprising a conductor encircling said dielectric means and adapted to carry high frequency electrical oscillations therein for initiating electrostatic effects in said channel for the purpose of facilitating the initiation of electrical discharge therein.

2,102,190

DISCHARGE APPARATUS AND METHOD

Robert E. Barclay, Chicago, Ill., assignor to Federal Electric Company, Inc., Chicago, Ill., a corporation of New York



Application January 5, 1934, Serial No. 705,393

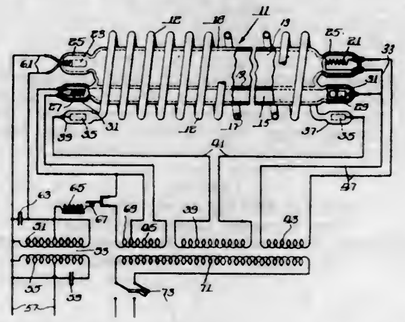
Renewed August 10, 1937

12 Claims. (Cl. 176—124)

1. A gaseous conduction device comprising an envelope defining a sealed channel having legs

containing a gaseous medium adapted to be energized to sustain electrical discharge therein, said channel having portions disposed adjacently with dielectric means therebetween, spaced electrodes communicating with said adjacently disposed portions of the sealed channel to energize the gaseous medium therein, and an exciter operatively associated with said adjacently disposed channel portions and comprising a conductor

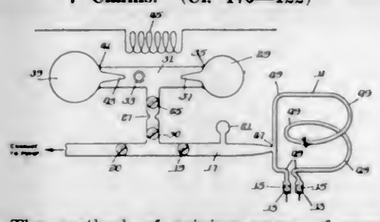
embracing the adjacently disposed channel portions of said exciter and having terminals, the spaced electrodes of the discharge device being contained in envelope extensions and being received, together with the terminals of the exciter, and secured in a supporting base carrying terminals electrically connected with the exciter terminals and with the electrodes to facilitate mounting the device and connecting it with external electrical power circuits.



2,102,191

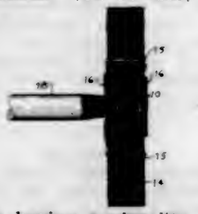
GASEOUS CONDUCTION DEVICE

Robert E. Barclay, Chicago, Ill., assignor to Federal Electric Company, Inc., Chicago, Ill., a corporation of New York



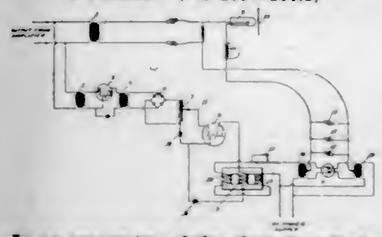
Application July 8, 1935, Serial No. 30,305

35 Claims. (Cl. 176—122)



1. A gaseous conduction device comprising means forming a pair of adjacently extending elongated gaseous conduction elements, and an elongated embracing element arranged about said adjacently extending elements, wherein the adjacently extending elements contain gaseous conduction media of unlike character and adapted when excited to produce a synthetic light of predetermined color characteristics comprising the combined spectrum of the light produced by the gaseous media in the several elements.

2,102,192
MEANS FOR AND METHOD OF EFFECTING GASEOUS MIXTURES
Robert E. Barclay, Chicago, Ill., assignor to Federal Electric Company, Inc., Chicago, Ill., a corporation of New York
Application April 17, 1935, Serial No. 16,773
7 Claims. (Cl. 176—122)

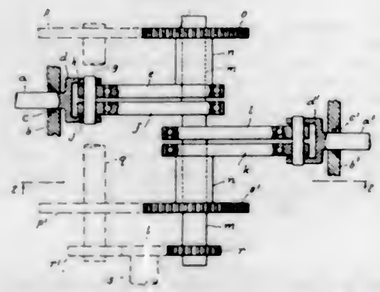


1. The method of mixing gases of unequal weights in predetermined proportions, which consists in mingling predetermined quantities of the gases to be mixed and subjecting them to the effects of high frequency excitation to induce ionic activity to prevent stratification of the mixed gases.

2,102,193
BUFFER CORE
James C. Burkhardt, Dayton, Ohio
Application October 5, 1936, Serial No. 104,055
3 Claims. (Cl. 51—193)

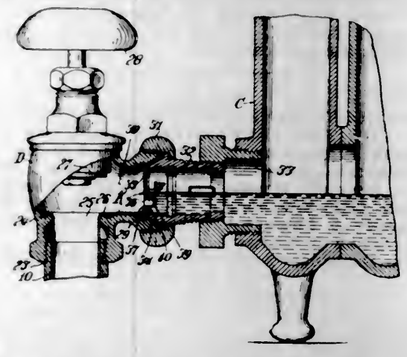
1. In a buffer having a plurality of laminae provided with a centrally located aperture adapted for use with an externally threaded tapering mandrel, a tubular sleeve extending through the aperture and having a plurality of radial lobes extending outwardly from each end thereof into engagement with the sides of the laminae, the lobes of one end formed by splitting the end of the tubular sleeve being arranged in staggered relation with respect to the lobes of the opposite end so as to firmly grip the laminations, the aperture through the tubular member being adapted to be mounted upon the mandrel.

2,102,194
SOUND RECORDING SYSTEM
Don Canady, Cleveland, Ohio
Application September 3, 1936, Serial No. 99,320
8 Claims. (Cl. 179—100.3)



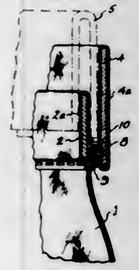
1. In an apparatus of the class described comprising an amplifying circuit, a secondary circuit electrically connected thereto and having therein a plurality of electrical translating means, one of which means has its plate circuit electrically associated with a leg of a saturable impedance positioned in an energy receiving circuit, the reactance of which reactor is partially controlled in the secondary circuit, a controlling circuit electrically associated with the energy receiving circuit and controlling the light intensity of the recording lamp in the amplifying circuit.

2,102,195
SAFETY SIGNAL FOR FIREARMS
Robert Braughton Conniffe, Tillman, S. C.
Application August 12, 1936, Serial No. 95,640
1 Claim. (Cl. 42—1)



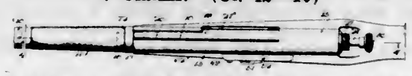
A shot gun having a breech block provided in the upper portion thereof with a groove adapted when the shot gun is closed to communicate with the barrel of the gun, a pin traversing said groove, a lever within said groove and pivoted at its forward end on said pin, said lever having an integral portion projecting forwardly and inwardly of the pivoted end to provide a forwardly disposed cam and a depending shoulder, and a helical spring extending longitudinally of the lower portion of the groove with one end engaged with the rear wall of the groove and its other end engaged with the said depending shoulder for yieldably positioning said lever with its cam end disposed forwardly of the groove in the direction of the barrel and its other end housed within the said groove.

2,102,196
DRIVING MECHANISM FOR INTERNAL COMBUSTION ENGINES AND THE LIKE
Alfred Henry Craske, Salisbury, England, assignor of one-half to William Raleigh Kerr Gandell, West Kensington, London, England
Application September 28, 1936, Serial No. 103,043
In Great Britain October 1, 1935
8 Claims. (Cl. 74—44)



1. Means for converting reciprocating motion into rotary motion or vice versa, such means comprising one or more combinations of not less than two eccentrics acting respectively on two concentric shafts, means being provided whereby the shafts are caused to revolve in opposite directions, but at the same speed.

2,102,197
ONE PIPE HEATING SYSTEM REGULATING PLATE
David N. Crosthwait, Jr., Marshalltown, Iowa, assignor to C. A. Dunham Company, Marshalltown, Iowa, a corporation of Iowa
Application August 24, 1936, Serial No. 97,636
10 Claims. (Cl. 237—67)

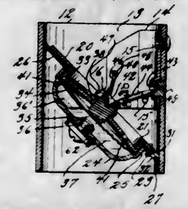


1. In a steam heating system, a radiator, a conduit communicating with a lower portion of the radiator and functioning to supply steam to the radiator and drain condensate therefrom, and a regulating plate in said conduit, said plate being formed with two separate and constantly open orifices, one for the restricted passage of steam to the radiator and the other for the passage of condensate from the radiator, the condensate orifice being so formed and positioned as to hold a head of water at the radiator side of the orifice sufficient to overbalance the difference in steam pressures at the two sides of the plate.

2,102,198
CLERICAL VESTMENT
Lawrence Dickman and George Dickman, Covington, Ky.
Application March 2, 1936, Serial No. 66,526
7 Claims. (Cl. 2—127)

1. A clerical garment adapted to be worn with a clerical collar having collar button holes, comprising a bosom portion, an inner upstanding neck portion adapted to be tucked up into said collar, and an outer upstanding neck portion having collar button holes registering with said first mentioned holes and adapted to encircle said collar on the outside thereof, and to be fastened thereto at the rear with the same collar button used with the collar.

2,102,199
GUN
Fate Dixon, Durham, N. C., assignor of one-half to James Edward Moses, Durham, N. C.
Application January 26, 1937, Serial No. 122,471
7 Claims. (Cl. 42—10)

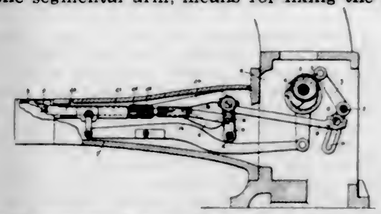


1. A gun comprising a housing having a bayonet slot, a barrel slidably mounted within the housing and having a part operating within the bayonet slot, a spring pressed sliding bolt carried by the housing and having a firing pin, a lock bar connected with the sliding bolt to move therewith, automatic safety means to move the lock bar rearwardly to shift the firing pin to the safety position and releasable means to hold the lock bar in the safety position and to also hold it in the cocked position.

2,102,200
REFINING DIPHENYL SULPHIDE
Gregg Dougherty, Princeton, N. J.
No Drawing. Application July 3, 1936, Serial No. 88,909
4 Claims. (Cl. 260—156)

1. The process of treating diphenyl sulphide for removal of unpleasant odor, which comprises subjecting such diphenyl sulphide to the action of a halogen.

2,102,201
THERMOSTAT
John D. Durant, Adrian, Mich., assignor to Schwarze Electric Company, Adrian, Mich., a corporation of Michigan
Application July 19, 1935, Serial No. 32,243
3 Claims. (Cl. 236—34)

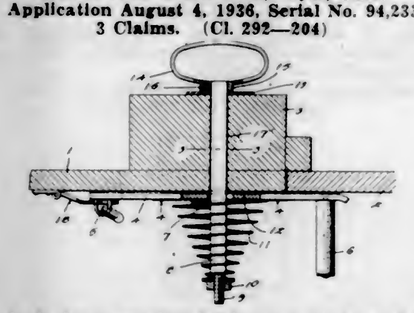


1. In connection with a thermostat installation, a rockable valve device embodying a U-shaped bracket member providing a pair of spaced aligned fulcra and an intermediate seat, a valve member having trunnion means mounted in said fulcra, there being means at said valve member including a chamber housing, a temperature expansion responsive medium, a plunger with a second seat thrust relatively to the valve member by the medium, a strut between the plunger seat and the first mentioned seat, and spring means opposing said thrust.

2,102,202
DIFFERENTIAL FEED DEVICE FOR SEWING MACHINES
Fritz Ebert, Oberndorf-on-the-Neckar, Germany, assignor to Mauser-Werke A. G., Oberndorf-on-the-Neckar, Germany, a joint-stock company of Germany
Application December 30, 1935, Serial No. 56,808
In Germany December 31, 1934
8 Claims. (Cl. 112—208)

1. Differential work feed mechanism for sewing machines, comprising a pedestal, a carrier

arm extending therefrom, a main work feed device, a differential work feed device, an intermediate lever mounted in the carrier arm and rocking about an axis transverse thereto and located near the pedestal, a main drive shaft journalled in the pedestal, a lever oscillated by said main drive shaft and having a segmental arm, a link connecting said intermediate lever to the segmental arm, means for fixing the link



to said segmental arm at an adjustable distance from the axis of oscillation of said lever, connections between the intermediate lever and the main and auxiliary feed devices, said devices and connections reciprocating longitudinally of the carrier arm, and means in the connections between the intermediate lever and the differential work feed device for independently adjusting the stroke length of said device.

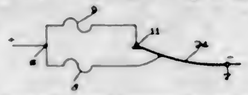
2,102,203

LATCH FOR DOORS OF BARNS, SHEDS, ETC.

Edwin Fred Groenewold, Loyal, Okla.

Application August 4, 1936, Serial No. 94,233
3 Claims. (Cl. 292—204)

1. A door securing latch comprising a shaft designed to be mounted for axial oscillation in a wall adjacent to and in transverse relation with the edge of a door, a bar member having the shaft extended therethrough, the bar being slidable on the shaft but held against rotary motion thereon, spring means encircling the shaft and secured at one end thereto and having its outer end bearing against the bar to force the latter against the adjacent face of the wall, handle means carried by the bar at one end, a staple carried by the bar at the other end, and a handle carried by the shaft upon the end at the side of the wall opposite from the spring.



2,102,204

FUSE PROTECTIVE CIRCUIT

Lester C. Hart, Cleveland, Ohio, assignor to Hi-Voltage Equipment Company, a corporation of Pennsylvania

Application June 20, 1936, Serial No. 86,252
1 Claim. (Cl. 175—294)

In combination in a fuse assembly, a circuit including a short circuit fuse and a thermal switch in series, and an overload fuse in shunt with said short circuit fuse and the switch, said switch being adapted to remain in closed position under normal current load but to open after a prede-

termined time interval upon an increase in current load above normal so that with the switch in open position, a full current flow occurs through the overload fuse.

2,102,205

CELLULOSE MIXED ETHERS AND PROCESS FOR THE PREPARATION THEREOF

Joseph F. Haskins, Wilmington, and Deane C. Ellsworth, deceased, late of Wilmington, Del., by Joseph F. Haskins, administrator, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 23, 1936, Serial No. 60,520
10 Claims. (Cl. 260—152)

1. In a process of producing mixed ethers of cellulose, the step which comprises reacting a lower partially alkylated cellulose, containing at least 0.5 mole of a lower alkyl group having less than three carbon atoms for each glucose unit of the cellulose, with a higher alkyl halide containing eight to eighteen carbon atoms, in the presence of an alkali.

2,102,206

RENEWABLE ELECTRIC FUSE

George E. Holmes, Elkhart, Ind.

Application July 29, 1936, Serial No. 93,148
6 Claims. (Cl. 200—125)

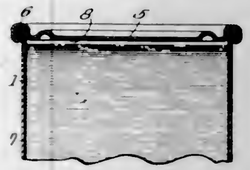
5. A renewable fuse device comprising a receptacle having a recess therein a plug insertable in said recess in a plurality of positions to be non-rotatable therein, said plug having a U shaped fuse element with a leg thereof exposed on each side of said plug, and having a plurality of narrow fusing portions therein, and a pair of contact members mounted to project into said recess on opposite sides thereof to engage said strip, one of said contacts being above the height of the narrow fusing portion of said strip and the other contact being below the height of said narrow fusing portions, to place one of said narrow fusing portions in circuit with said contacts in each position of insertion of said plug.

2,102,207

COATED PAPER AND PAPER-COATING COMPOSITIONS

James K. Hunt and George H. Latham, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 23, 1936, Serial No. 60,521
8 Claims. (Cl. 91—68)



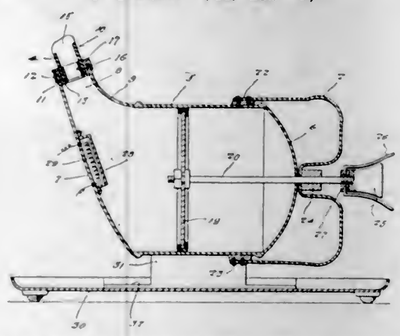
1. A highly grease-proof, water and moisture resistant product comprising paper coated with a composition which comprises a mixed alkyl ether of cellulose containing in the same molecule lower saturated alkyl radicals of not more than two carbon atoms and higher saturated aliphatic alkyl radicals of at least eight carbon atoms.

2,102,208

PROCESS OF PACKAGING BEER IN OPEN TOP METAL CONTAINERS

Alfred L. Kronquest, Syracuse, N. Y., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application July 24, 1935, Serial No. 32,938
Renewed July 13, 1937
2 Claims. (Cl. 99—182)



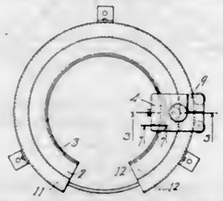
2. The process of packaging beer in an open top metal container consisting in heating a petroleum wax having a melting point above 140° F. to render the same fluid, flowing said fluid wax over the entire inner surface of the open top container, filling the container with beer, seaming an end to the container for closing the same, the inner surface of which end is coated with a thermoplastic enamel having a melting point above 140° F., which coating is raised to a temperature for rendering the same fluid after the end is die-shaped and prior to the seaming of the same to the container and subjecting the sealed container to heat for pasteurizing the beer.

2,102,209

APPLICATOR

Eulilee McDannold, Mountain View, Calif.

Application December 10, 1935, Serial No. 53,786
6 Claims. (Cl. 132—9)



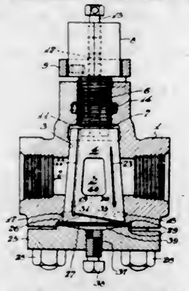
1. In an applicator of the character described, a container provided with a spout having a substantially rectangular discharge mouth, a comb-back of rectangular frame-like structure fitting snugly within the mouth of said nozzle, and a series of relatively spaced comb-fingers having end portions secured within the frame structure of said comb-back, said comb-fingers being hollow and respectively open at their inner and outer ends for the passage of the contents of the container through said fingers.

2,102,210

COLLAR SUPPORTING AND IRONING DEVICE

Adolph A. Myers, Louisville, Ky.

Application July 15, 1935, Serial No. 31,399
4 Claims. (Cl. 223—52.6)



1. A collar supporting and ironing device comprising a collar supporting band providing a support over which a creased collar may be straddled, a trackway extending along the outer side of said band, and a collar iron supported on said trackway for movement along said band in ironing relation to a collar on said band.

2,102,211

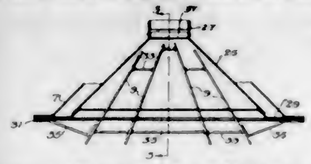
PLUG VALVE

Sven J. Nordstrom, Piedmont, Calif., assignor to Merco Nordstrom Valve Company, Pittsburgh, Pa., a corporation of Delaware

Application December 19, 1935, Serial No. 55,238
12 Claims. (Cl. 251—112)

1. In a plug valve, a casing having a passageway therethrough for flow of fluid and a bore formed transversely of the passageway, a rotatable plug located in said bore, an inherently resilient cover closing one end of the bore, flexible means interposed between the cover and valve casing and providing a fluid chamber with the cover, and means for applying fluid under pressure to said chamber to deflect the cover and yieldingly urge the plug in a longitudinal direction.

2,102,212



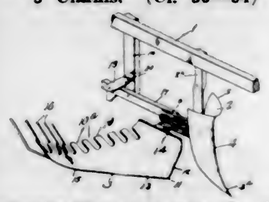
SOUND REPRODUCING APPARATUS

Harry F. Olson, Audubon, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application September 30, 1935, Serial No. 42,896
9 Claims. (Cl. 181—31)

1. In a sound reproducing apparatus, a substantially vertical baffle having an opening, a loud speaker having a cone type diaphragm adapted to be driven to radiate directly low frequency sound waves and a beam of high frequency sound waves, means for mounting said speaker in operative relation to said opening and with the axis of said diaphragm inclined upwards for raising said beam from the horizontal

and means positioned adjacent the concave surface of said diaphragm in intimate acoustic cou-



pling relation therewith for diffusing said beam of high frequency sound waves horizontally.

2,102,213

ROOT CROP DIGGING DEVICE

Walter Pannike, Waterloo, Ontario, Canada
Application April 22, 1936, Serial No. 75,794
In Germany January 23, 1936
5 Claims. (Cl. 55—54)

1. In combination, apparatus for digging root crops comprising a frame, a stalk and root remover carried by said frame, a share carried by said frame to the rear of said remover, said remover being shaped to lift the stalk and root out of the ground and pass the stalk and root to the share and a grill secured to the side of the stalk remover adjacent the share and extending rearwardly therefrom in substantially a horizontal plane.

2,102,214

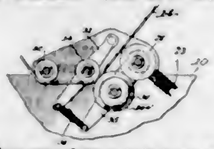
ART OF PREVENTING SEIZURE OF CONTACTING SURFACES OF SOFT ALLOYS AND LIKE MATERIALS

Arthur L. Parker, Cleveland, Ohio
No Drawing. Application November 6, 1934, Serial No. 751,750
5 Claims. (Cl. 91—68)

1. An article of manufacture comprising a soft metal part such as aluminum and aluminum alloy, having threaded portions which are coated with a thin adherent film of an anti-seizing material composed of stearic acid and a compound selected from the group consisting of zinc, aluminum and lead stearates, combined with a modifying ingredient comprising a lacquer base in such amount as to form a coating which will stand handling without marring or chipping.

2,102,215

IRON AND STEEL ALLOY HAVING CORROSION RESISTANCE



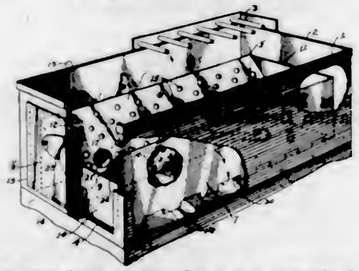
Russell F. Passano, Middletown, Ohio, assignor to The American Rolling Mill Company, Middletown, Ohio, a corporation of Ohio
No Drawing. Application September 20, 1935, Serial No. 41,453
3 Claims. (Cl. 75—125)

1. A corrosion resistant alloy having the following analysis: Carbon 0.005 per cent to 0.15 per cent, manganese 0.030 per cent to 0.80 per cent, phosphorus 0.05 per cent to 0.15 per cent, copper 0.20 per cent to 0.75 per cent, nickel 0.20 per cent to 0.75 per cent, molybdenum 0.10 per cent to 0.50 per cent balance substantially all iron.

2,102,216

SUPPLYING INK TO INK TRANSFER MEMBERS

George Ernest Pelton, Middleburg, Va.
Original application September 19, 1932, Serial No. 633,874, now Patent No. 2,074,970, dated March 23, 1937. Divided and this application November 13, 1936, Serial No. 110,711
11 Claims. (Cl. 197—171)

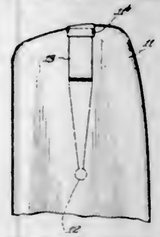


1. Device for supplying ink to a writing ribbon in a typewriter as said ribbon travels back and forth during intermittent operation of said typewriter, to maintain an approximately uniform supply of ink in said ribbon at the typing position, comprising two rotary inking members, adjacent each other which are substantially non-ink-absorptive, and a pulley which contacts with said ribbon opposite that face of said ribbon which contacts a rotary inking member; an ink reservoir, whose ink supply lies below said pulley; said ink being placed on a face of said writing ribbon by a rotary inking member in predetermined amounts, accurately gauged; at least two of said rotary members, of said device for supplying ink, being connected by gears.

2,102,217

FIREBOX

Charles B. Pothemus, San Jose, Calif.
Application March 26, 1936, Serial No. 70,969
3 Claims. (Cl. 126—29)



3. A structure of the character described comprising, an open topped firebox, an oblong member that is M-shaped in transverse cross-section disposed therein and in spaced relation to the walls thereof, said member having the central V-shaped portion perforated and the side portions provided with air passages to connect the spaces between the V-shaped portion and the side portions with the spaces between the side portions and the firebox wall.

2,102,218

SPECTACLE CASE

James T. Rakauskas, Chicago, Ill.
Application December 31, 1936, Serial No. 118,654
4 Claims. (Cl. 24—3)

1. A combined spectacle case and pocket clip therefor, said case being formed to provide a substantially horizontal slot therein adjacent an upper edge portion thereon, an integral extension of said edge of said case above said slot, said clip including a shank extending through said slot and upwardly towards said edge along the inside of said case, said extension engaging the

free end of said shank and to fasten said clip to said case.

2,102,219

WATER SOFTENING COMPOUND

Sidney A. Raymond, Green Bay, Wis.
No Drawing. Application November 10, 1936, Serial No. 110,185
4 Claims. (Cl. 210—23)

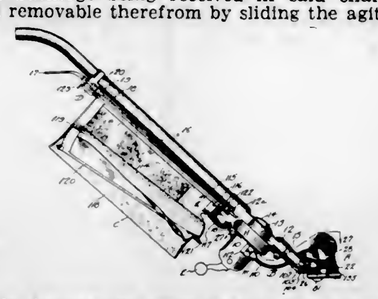
1. The improved water softening compound consisting of tri-sodium phosphate, sodium aluminate, borax, and an alum.

2,102,220

DEVICE FOR USE IN PLAYING SOLITAIRE CONTRACT BRIDGE

Charles H. Richardson, Dover, N. H.
Application November 21, 1935, Serial No. 50,883
9 Claims. (Cl. 273—150)

1. A device for use in playing solitaire contract bridge having, in combination, a base, a table rotatably mounted thereon, a plurality of card holders each rotatably mounted on the table, and means for yieldingly maintaining each holder in place on the table in any position to which said holder may be rotated thereon.



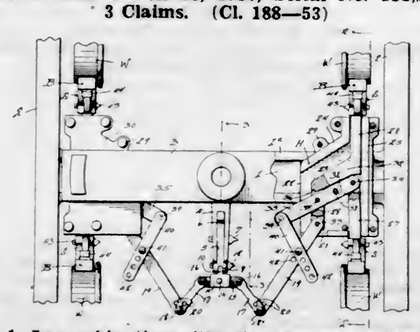
2,102,221

VACUUM CLEANER

Frederick Riebel, Jr., and Dewey M. Dow, Toledo, Ohio, assignors to Air-Way Electric Appliance Corporation, Toledo, Ohio, a corporation of Delaware
Application November 9, 1934, Serial No. 752,270
10 Claims. (Cl. 15—8)

1. In a suction cleaner, a suction producing unit including a prime mover, a floor tool attached to said unit, a rotary agitator in said floor tool, an auxiliary electric motor mounted upon the top of said floor tool with its axis parallel to the axis of said agitator, a drive pulley at one end of said motor, a casing covering said motor, a belt housing cover on the end of the casing, closed thereagainst and extending to the top wall of the floor tool, an opening in said wall, below said belt housing, a driven pulley on said agitator below said opening, a belt travelling on said pulleys and extending through said opening and an air inlet between the lower end of said belt housing and said top wall, opposite the upwardly moving reach of said belt.

3. In a suction cleaner, a suction head formed integrally with rigid vertical channels in its end walls, a rotary agitator, shaft ends projecting from the ends thereof, a pair of bearing bushings loosely mounted on the respective shaft ends, said bushings being received in said channels and removable therefrom by sliding the agitator



bodily downwardly, each bushing being in substantial contact simultaneously with both sides of its respective channel and spring detent means engaging the rounded side faces of said bushings and retaining them in the channels.

2,102,222

BRAKE ACTUATING MECHANISM

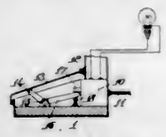
William I. Riley, Trussville, Ala.
Application March 16, 1937, Serial No. 131,221
3 Claims. (Cl. 188—53)

1. In combination with a transverse member of a wheel truck, plungers supported by said transverse member for sliding movement beyond opposite sides of the member, one of the plungers having its inner portion laterally offset, a lever pivotally connected with the inner end portion of the second plunger and with the offset part, means for pivotally holding said lever to the transverse member at a point between its pivotal connection with the plungers, a secondary lever pivotally connected to the offset portion of one of the levers, a link pivotally connecting the first named lever and the secondary lever, means for swinging the secondary lever to move the plungers outwardly or inwardly in unison, and brake shoes carried by the outer extremities of the plungers.

2,102,223

MULTIPLE FASTENER

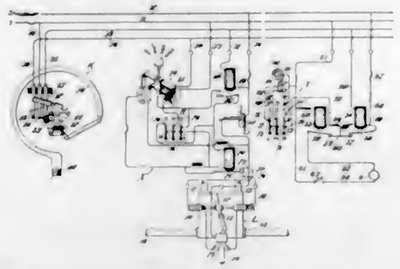
Leo Roseman, Newark, N. J.
Application September 18, 1936, Serial No. 101,383
20 Claims. (Cl. 2—38)



1. A fastener comprising two pieces of material disposed in edgewise approximately abutting relation, one having hook elements secured thereon and spaced longitudinally thereof with their bills extending longitudinally of the piece

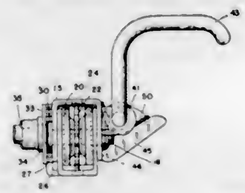
and approximately parallel to the edge thereof, the other piece having tubular loops of pliable material secured thereon with their axes approxi-

mately parallel to the edge of the piece each to frictionally receive the bill of one of said hook elements for connecting said pieces together.



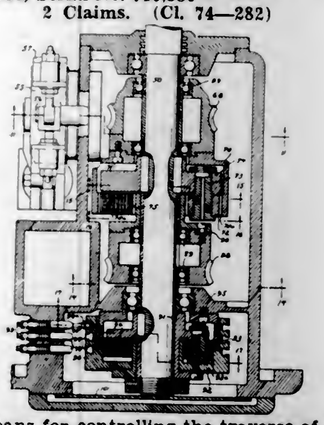
2,102,224
ELECTRIC LAMP
Ernst Ruppel, Gotha, Germany
Application February 21, 1935, Serial No. 7,630
In Germany February 22, 1934
5 Claims. (Cl. 240—123)

1. Electric table light with box-like base, a column disposed on said base and supporting a lamp, and a double action switch covered in said base and adapted to be operated from the exterior thereof, at least the greater portion of the upper side of the box being formed as a base cover plate, movable relative to the box-like base and connected with the switch so that through pressure exerted from above on said movable plate the switch is operated to circuit-closing position, and, after release of the pressure, remains in this position until action is again exerted on the plate.



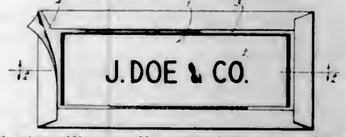
2,102,225
TEMPERATURE CONTROL SYSTEM FOR RAILWAY CARS
Edward A. Russell, Chicago, and Donald W. Miller, Elmhurst, Ill., assignors to Vapor Car Heating Company, Inc., Chicago, Ill., a corporation of New York
Application April 6, 1931, Serial No. 528,058
24 Claims. (Cl. 236—1)

10. In combination with a railway car, temperature regulating mechanism thereon including a heating system and a refrigerating system, thermostatic control mechanism for causing the temperature regulating mechanism to maintain a predetermined temperature within the car, a power supply line on the car which is connected in circuit with a train power source when the car is connected in service as a unit of a train, and means connected with said power line for rendering the refrigerating means entirely inoperative and for limiting the operation of the heating means to the maintenance of a predetermined minimum temperature in the car when the car is out of service and the power line is broken.



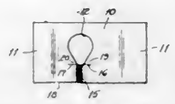
23. In combination with heat-exchange apparatus for maintaining a selected temperature within an enclosure, regulating means for controlling the action of the heat-exchange apparatus to maintain any selected one of a plurality of temperatures within the enclosure, said means comprising a plurality of thermostats, each thermostat adapted to function to maintain a certain predetermined one of these temperatures, and thermostatic means responsive to outside temperatures for selecting the temperature to be maintained within the enclosure.

2,102,226
SEAT SUPPORT
Walter S. Saunders and Thomas A. McGregor, Pontiac, Mich., assignors to American Forging & Socket Company, Pontiac, Mich., a corporation of Michigan
Application November 9, 1936, Serial No. 109,859
6 Claims. (Cl. 155—14)



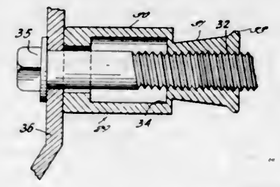
1. Slidable supporting means for a seat or the like comprising a track channel having upwardly projecting flanges, a carriage element rollable over the track element and comprising a channel member inverted over the track element, said channels having their flanges overlapping and interfitted, opposed portions of channels being serially perforated, and guiding and anti-friction means arranged between said elements and housed within the space enclosed thereby, comprising rollers engageable with said top and bottom surfaces, gear portions movable with the rollers and meshing with said serial perforations, the overlapping webs of said element being longitudinally slotted in substantial alignment with the axes of said rollers, and axle members for said rollers projecting through said slots to prevent the separation of said elements and limit the travel of the carriage with respect to the track element.

2,102,227
CONVEYER FEED MILLING MACHINE
William Sinclair, Detroit, Mich., assignor to Production Engineering Company, Detroit, Mich., a corporation of Michigan
Original application February 24, 1930, Serial No. 430,688. Divided and this application August 22, 1934, Serial No. 740,880
2 Claims. (Cl. 74—282)



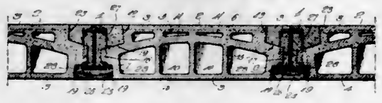
1. Means for controlling the traverse of a machine tool or the like comprising, in combination with a shaft, planetary gearing mounted thereon including a sun gear loose on the shaft, a cage fast upon the shaft, planetary gears carried by the cage and meshing with the sun gear, another gear of different size from the sun gear, also concentric with the shaft and meshing with said planetary gears, independent driving means for said sun gear and said other gear, including a worm connected to said sun gear, a worm connected to said other gear, and an independent motor connected to each worm, whereby the shaft is actuable at different speeds depending upon which of said motors is, or whether both motors are, running, and whereby when either motor is at rest, the gear to which it is connected is held against rotation by its worm, controlling means for said motors, including switching means drivable by said shaft, a worm wheel for driving each of said sun gear and other gear, said worm wheels also being concentrically carried by said shaft, and meshing with said worms to prevent turning of the sun gear or other gear when the driving motor of either is at rest, said switching means including a control member also concentrically mounted on and drivable by the shaft, and reduction gearing connecting the shaft and control member.

2,102,228
STENCIL
John C. Smith, Beaver, Pa., assignor to Solar Laboratories, Beaver, Pa., a corporation of Pennsylvania
Application November 3, 1936, Serial No. 108,951
4 Claims. (Cl. 101—127)



1. A stenciling unit comprising a metal frame, a stencil membrane spanning said frame, resinous soldering medium integrating the frame and the membrane into a substantially unitary structure.

2,102,229
FASTENING DEVICE
George A. Tinnerman, Rocky River, Ohio, assignor to Albert H. Tinnerman, Cleveland, Ohio
Application June 17, 1936, Serial No. 85,750
3 Claims. (Cl. 85—32)



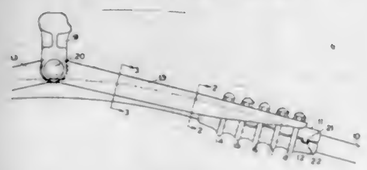
1. A threadless fastener comprising a metallic strip having substantially parallel longitudinal edges and having a bolt receiving irregular opening therein, the fastener having a slit extending substantially tangentially to one end of the opening and also substantially parallel to one of the longitudinal edges, the slit cooperating with the opening to provide a single yieldable tongue which is adapted to be moved with reference to the body portion.

2,102,230
EXPANSION BOLT
George Henry Waterman, Wyomissing, Pa.
Application July 24, 1936, Serial No. 92,339
1 Claim. (Cl. 85—2.4)

In a structure of the class described, a body cylindrical in cross-sectional form provided on its peripheral surface with fins circumferentially spaced and forming longitudinal retaining ribs extending from end to end of said body, and a conical nut attached by an annular rib to one end of said body, said annular rib being breakable to permit longitudinal movement of the nut into the body to expand the latter, said nut being provided on its outer end with an outstanding lateral flange.

2,102,231
FLOOR OR CEILING STRUCTURE
Robert Zoettl, Salzburg, Austria, assignor of one-half to Hans Knoll, Salzburg, Austria
Application October 4, 1935, Serial No. 43,617
In Germany October 8, 1934
14 Claims. (Cl. 72—66)

13. In a floor or ceiling structure, an I-beam, rows of tiles disposed on opposite sides of the beam and having supporting lugs engaging the lower flanges of the beam and provided with supporting flanges located below the plane of the bottom of the beam, bridge plates disposed to close the space between the rows of tiles beneath



the beam and in spaced relation thereto, said plates having their upper surfaces recessed, a filling of binding material between each row of tiles and the adjacent side of the beam, and binding material between the bottom of the beam and rows of tiles and the bridge plates, said material seating in the recessed upper surfaces of said plates.

2,102,232

UNIFORM ARC, COMPENSATING CHORD CONDUCTOR SUPPORT WITH RESILIENT GRIP HEADS

Arthur O. Austin, near Barberton, Ohio

Application February 3, 1934, Serial No. 709,609
30 Claims. (Cl. 248—63)

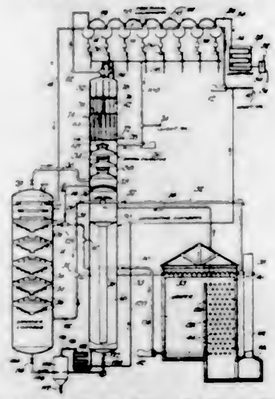
1. The combination with a conductor of a carrier for said conductor comprising a supporting member, separate links extending in opposite directions from said supporting member and having their adjacent ends pivoted to said member by coaxial pins or bosses, one at each side of the conductor and clamps carried by the outer ends of said links respectively for gripping said conductor at spaced points thereon said supporting member and links providing clearance for said conductor to move vertically past the pivotal axis of said links on said supporting member, said common axis being located substantially in line with the axis of the cable ends where they leave said clamps.

2,102,233

THERMAL INSULATION

Frank A. Biederman, Chicago, Ill., assignor to Paper Patents Company, Neenah, Wis., a corporation of Wisconsin

Application May 16, 1932, Serial No. 611,623
Renewed November 2, 1935
8 Claims. (Cl. 154—44)



1. A thermal insulating unit comprising an assembly of superposed creped tissue paper sheets which are of such thinness as to be not self-supporting, and a casing enclosing the assembly, the sheets being suspended edgewise from the top wall of the casing.

2,102,234

DISTILLATION OF OIL

David G. Brandt, Westfield, N. J., assignor, by mesne assignments, to Power Patents Company, Jersey City, N. J., a corporation of Maine

Application January 31, 1922, Serial No. 532,953
Renewed January 14, 1928
32 Claims. (Cl. 196—66)

1. A process of cracking high boiling hydrocarbon oils to form low boiling hydrocarbon oils comprising maintaining a first body of oil of high boiling point, maintaining a second body of oil of lower boiling point, circulating oil from said second body through a heater and returning it to said second body, separating vapors from the heated oil and passing them through the first body of oil.

2,102,235

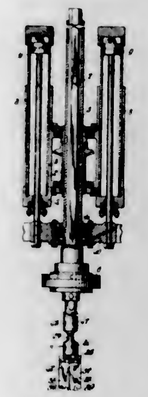
VACCINES AND PROCESS FOR MANUFACTURING VACCINES

Marion Dorset, deceased, late of Washington, D. C., by Virgil Jackson Dorset, administrator, Washington, D. C., assignor to Henry A. Wallace, as Secretary of Agriculture of the United States of America

No Drawing. Application January 15, 1936, Serial No. 59,159½
2 Claims. (Cl. 167—80)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A process for the manufacture of vaccine against hog cholera which comprises mixing together virulent defibrinated virus blood from swine sick with hog cholera with from 1/50 to 1/17 of its volume of a 1 per cent aqueous solution of crystal violet, and maintaining the mixture at near 37.5° C. for approximately two weeks, until the material becomes incapable of transmitting hog cholera when injected into susceptible swine.

2,102,236



DRILLING IMPLEMENT

Harry C. Johansen, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application May 4, 1934, Serial No. 723,919
4 Claims. (Cl. 255—61)

4. In an implement of the character described, a rotary drive element, a drilling element, said elements being relatively rotatable, yielding means connecting said elements, and means comprising an abutment fixed as regards rotation relative to said drilling element and a cooperating abutment

fixed as regards rotation relative to said drive element for limiting yielding of said yieldable means, upon relative rotation between said elements,

providing substantially equal limits of yield irrespective of the axial deformations of said yielding means.

2,102,237

REEL SEAT FOR FISHING ROD HANDLES

John Karl Kinnear, Geneva, Ohio, assignor to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio

Application November 30, 1936, Serial No. 113,371
6 Claims. (Cl. 43—22)

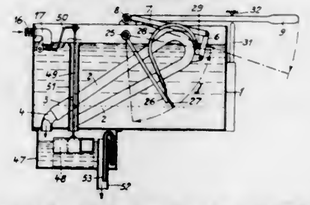
1. In a fishing rod handle, a hand grip portion, a reel seat base, a clamp element comprising an enlarged head portion and a hand grip connected portion, said head portion having a plurality of surfaces of different contour adapted to seat therein reels of varying sizes.

2,102,238

COPPER-NICKEL-TITANIUM ALLOYS

Norman B. Pilling, Westfield, N. J., and Paul D. Merica, New York, N. Y., assignors to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Original application October 1, 1931, Serial No. 566,311. Divided and this application November 16, 1935, Serial No. 50,240
31 Claims. (Cl. 148—32)



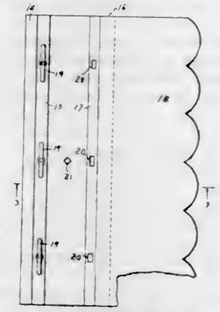
1. A hard nickel-copper alloy containing about 2% to about 50% nickel, at least 1 to about 10% titanium, and copper constituting substantially the balance of the alloy, said alloy being age hardened by heating the alloy to an elevated temperature below its melting point but sufficiently high to cause titanium to go into solution, quenching the alloy and reheating to a temperature below that of the initial heating but sufficiently high and for a period of time sufficient to obtain a substantial increase in the hardness of the alloy.

2,102,239

DEVICE FOR DISPENSING MEASURED QUANTITIES OF LIQUID

Fritz Schär, Zurich, Switzerland

Application May 11, 1936, Serial No. 79,191
In Switzerland May 10, 1935
10 Claims. (Cl. 221—95)



1. A device for dispensing predetermined quantities of liquid comprising in combination, a liquid supply pipe, a vessel connected to said pipe, an inlet valve, a float controlling said inlet valve, a syphon within said vessel, means to prime the syphon, a tube communicating with the intake leg of said syphon, the inlet opening of said tube being placed at the discharge level of the vessel, hydraulic means to automatically time the opening of said valve by said float.

2,102,240

REMOVABLE-DECORATIVE-WINDOW SHADE ATTACHMENT

Adolph Schwartz, Brooklyn, N. Y.

Application January 21, 1937, Serial No. 121,505
1 Claim. (Cl. 156—10)

An ornamental attachment for window shades comprising a single piece of material having a stiffening member, provided with a plurality of prong fasteners, secured adjacent to one end and another stiffening member, provided with a plurality of aligned openings, secured intermediate of the ends; the portion between the stiffening members being adapted to be folded around the lower part of the window shade with the prongs inserted through the material of the shade and through the apertures to secure it to the shade; and the free end of the attachment adapted to hang down over the clinched ends of the prongs to hide these.

2,102,241

HAIR WAVING APPLIANCE

Georg Ströher, Rothenkirchen, Germany

Application November 7, 1936, Serial No. 109,637
In Great Britain October 5, 1936
1 Claim. (Cl. 219—24)

A heating clamp for hair waving purposes comprising a pair of articulated jaws, each of said

jaws consisting of a single piece of ceramic material, at least one longitudinal recess in each of said jaws at the interior side thereof, a heating element disposed in said recess, a metal layer

on the interior surface of each of said ceramic jaws entirely covering said heating element, said metal layer being formed integral with said jaw and being devoid of extraneous fastening means.

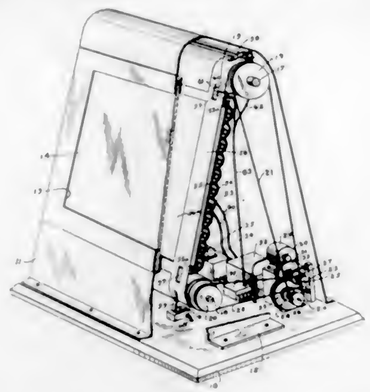
2,102,242

ORNAMENT AND FRAME THEREFOR

Leo K. Stupell, New York, N. Y.

Application October 5, 1935, Serial No. 43,704
6 Claims. (Cl. 40—140)

1. In combination, an ornament holder member comprising a frame having an opening, and an ornament member adapted to seat in said opening, said members being made of metal, the edge parts of said frame opening and of the ornament member having complementary grooves and projections, one of said members being of elastic material whereby said ornament member may be snapped into said frame with said complementary parts engaging to lock said ornament member in said frame, and means on said members for guiding the engaging movement of said parts, said members having means for preventing movement of the ornament member parts past the holder member parts when engaged for snapping together.



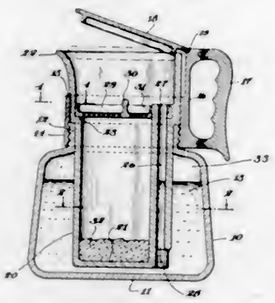
2,102,243

ANIMATED SIGN

Harry R. Van Deventer and John J. Shively, New York, N. Y., assignors, by mesne assignments, to Service Devices, Incorporated, New York, N. Y., a corporation of New York

Application September 6, 1935, Serial No. 39,360
2 Claims. (Cl. 40—53)

1. In a display device in combination, a pair of laterally spaced rollers having conducting surfaces, a film of insulating material spirally rollable on said rollers and having its opposite ends attached respectively thereto, said film having a perforation in its first lap on each of said rollers, means to alternately drive said rollers whereby said film may be rolled back and forth between them, and electrical control means for said driving means including a brush adjacent each roller and adapted to make contact with the conducting face thereof through said perforation whereby a circuit may be established while retaining a portion of said film on said roller behind said brush, the second laps of said film on said rollers



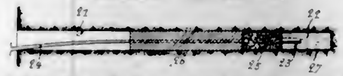
being adapted to override said perforations to break said contacts.

2,102,244

METHOD AND APPARATUS FOR STEEPING COFFEE, TEA, AND THE LIKE

Thomas M. Walsh, East Orange, N. J.

Application July 3, 1936, Serial No. 88,771
2 Claims. (Cl. 53—3)



1. In a device for steeping coffee, an outer vessel having an upper neck and adapted to contain water, an inner vessel removably insertable through said neck and having a peripheral shoulder seated thereon and in sealing relation with said neck, said inner vessel having an unperforated bottom wall adapted to receive the coffee to be steeped, a pipe extending from the upper portion of the inner vessel to the lower portion of the outer vessel, whereby steam generated in the latter will force heated water up through the pipe into the inner vessel and onto said coffee, the bottom wall of the inner vessel being arranged in close proximity to the bottom wall of the outer vessel, so that the heat applied to the bottom wall of the outer vessel to generate said steam will simultaneously effect a preliminary roasting of said coffee, and a handle structure embracing and attached to the neck and having a top hinged thereto and covering the inner vessel.

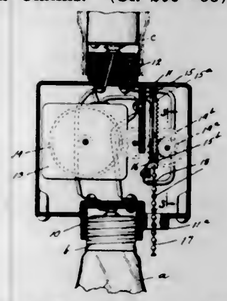
2,102,245

EXPLOSIVE CHARGE AND APPARATUS FOR THE MANUFACTURE OF THE SAME

Guillaume Weber, Hayange, Moselle, France, assignor to Les Petits Fils de Francois de Wendel & Cie, Paris, France

Application May 26, 1934, Serial No. 727,635
In France June 17, 1933
5 Claims. (Cl. 102—5)

1. A blasting charge comprising in combination a mixture of water in the form of snow and of carbon dioxide in the form of snow, and a heating element adjacent said mixture and adapted to produce the heat necessary to cause the instant vaporization of said mixture.



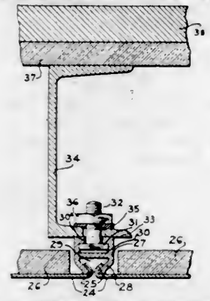
5. An apparatus for preparing an explosive mixture of water and carbon dioxide in the form of snow comprising an expansion chamber, a container adapted to receive liquid carbon dioxide under pressure, communicating means between said expansion chamber and said container, a nozzle at the end of said communicating means situated in said expansion chamber, whereby liquid carbon dioxide is adapted to be introduced in a finely divided state from said container into said chamber, a receptacle adapted to contain gaseous carbon dioxide under pressure, conduit means between said receptacle and said expansion chamber, injecting means at the end of said conduit means situated in said expansion chamber, water supplying means, and guiding means between said water supplying means and said injecting means adapted to bring water from said supplying means into said injecting means, whereby said water is adapted to be introduced in a finely divided state by said gaseous carbon dioxide into said expansion chamber.

2,102,246

TIME CONTROLLED ELECTRIC SWITCH FOR ELECTRIC BULBS

Abraham Weiss, New York, N. Y.

Application August 12, 1935, Serial No. 35,711
Renewed May 12, 1937
2 Claims. (Cl. 200—35)



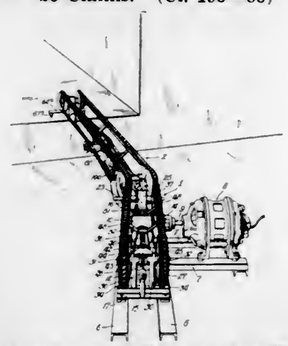
1. In an incandescent electric lamp a socket therefor, a clock mechanism in said socket including a driving gear and a time gear frictionally connected to said first named gear, an electric switch for the circuit of said lamp including a manually displaceable reciprocatory contact member cooperating with said time gear, so that when displaced in one direction, it will close the circuit and set said time gear for the desired period and when released will be caused to move in opposite direction by said time gear holding said circuit closed and on reaching its initial position open said circuit, said displaceable contact member forming a part of an endless manually operable pull means.

2,102,247

SHEET MATERIAL BUILDING CONSTRUCTION

John J. Whelan, Washington, D. C., assignor to Copper Houses, Inc., New York, N. Y., a corporation of Maryland

Application October 4, 1935, Serial No. 43,577
7 Claims. (Cl. 189—34)



1. A house or like structure including in combination: a supporting framework; a coupling-bar adapted to be secured to the said supporting framework and having both a longitudinal flange-receiving channel and a longitudinal attaching-groove therein; attaching-means entered into the longitudinal coupling-groove of the said coupling-bar and anchoring the same to the said supporting framework; and a pair of panels of sheet-material arranged with their edges adjacent and each having an offsetting coupling-flange entered into the flange-receiving channel of the said coupling-bar and coupled with one of the boundary walls thereof.

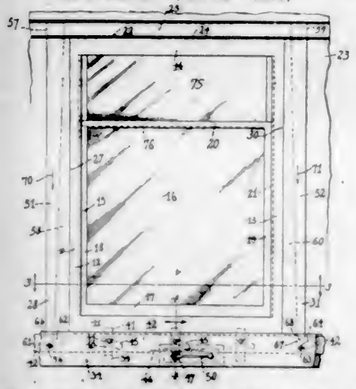
2,102,248

CONVEYER

Walter C. Yeakel, Battle Creek, Mich., assignor, by mesne assignments, to Clark Equipment Company, Buchanan, Mich., a corporation of Michigan

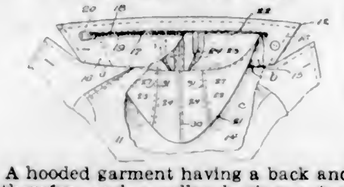
Application February 25, 1935, Serial No. 7,954
26 Claims. (Cl. 198—88)

7. A conveyer comprising a plurality of conveyer sections, conveying means on each of said sections, a longitudinal shaft extending from one end to the other of each of said sections for driv-



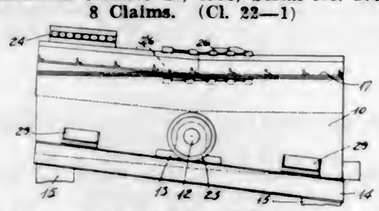
ing the conveying means of that section, a universal joint connecting the end of one longitudinal shaft with the adjacent end of the next shaft, means for supporting the end of one section on the adjacent end of the next section including a yoke swiveled for movement about one axis and carried by one section, a second yoke carried by the other section and swiveled for movement about an axis disposed at right angles to said first axis, and means pivotally supporting the arms of one yoke on the arms of the other yoke for relative movement about an axis at right angles to both of the aforesaid axes, all of said axes intersecting at a point in the plane of the axes of the universal joint connecting the two associated longitudinal shafts.

2,102,249
ANODE
John L. Young, Pittsburgh, and Allen C. Jephson, Johnstown, Pa.
Application June 10, 1935, Serial No. 25,728
4 Claims. (Cl. 204—4)



1. An anode of specific particular shape and size and of labyrinthine structure formed wholly of metal in metallic state consisting of a mass of tin-plated iron crushed to the shape desired with a multiplicity of discontinuous contacts, the mass being autogenously welded at such contacts.

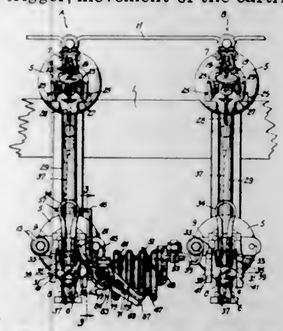
2,102,250
RELEASABLE WINDOW
William J. Zeeb, New York, John T. Dammes, Brooklyn, and Alfred C. Morris, New York, N. Y., assignors to Emergency Window and Exit Devices Corporation, New York, N. Y.
Application March 12, 1936, Serial No. 68,380
12 Claims. (Cl. 20—52.2)



8. In a window, having a frame carrying the window pane and being set into an opening in a wall, means to secure said frame in said opening, and a slidable element arranged on said wall adjacent to said frame, a single movement of said slidable element being adapted to instantly release said securing means, and permit said frame to be pushed out of said opening, either inwardly or outwardly.

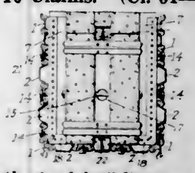
2,102,251
HOODED GARMENT
Morris Arst, Chicago, Ill.
Application April 29, 1937, Serial No. 139,655
2 Claims. (Cl. 2—84)

1. A hooded garment having a back and a lining therefor, and a collar having a top collar portion sewed to the lining and an undercollar portion secured to the back, said collar, back and lining providing a storage space for a hood, the undercollar portion having a lengthwise extending slit therein, fastening means for closing said slit, and a completely formed hood, with the front and back thereof folded together at the sides, and having an upright box pleat in its back, the hood being pressed flat to form creases along the marginal edges thereof and at the box pleat, said hood being stitched along its neck portion to the collar, on the inner side thereof, adjacent the slit therein, and capable of being stored in said space in a smooth condition.



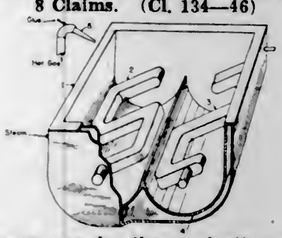
2,102,252
GYRATING MACHINE
George W. Behnke, Durand, Mich., assignor to Simplicity Engineering Company, Durand, Mich., a corporation of Michigan
Application October 12, 1936, Serial No. 105,302
8 Claims. (Cl. 22—1)

1. A screening apparatus of the class described and comprising a base, a gyrating screen frame mounted thereon and including spaced apart side walls, "work" supporting tracks secured to said side walls and adapted to support the "work", a screen interposed between said tracks, and driven means for gyrating said frame.



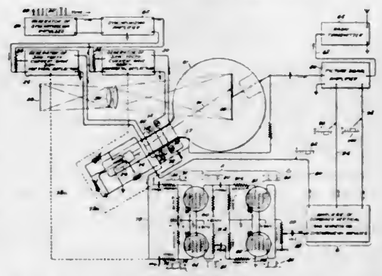
2,102,253
FUSE SWITCH
Theodore Birkenmaier, St. Louis, Mo., assignor to W. N. Matthews Corporation, St. Louis, Mo., a corporation of Missouri
Application May 18, 1935, Serial No. 22,139
7 Claims. (Cl. 200—126)

7. An attachment for fuse switches having line terminals and swingable cartridges, comprising a bracket adapted to be fastened to one line terminal adjacent the point of swinging of the cartridge, an insulator thereon, a contact carried by the insulator and adapted to be electrically connected with another one of said fuse switches, a switch blade pivoted to said bracket and normally insulated from said contact, an over-centering spring adapted to hold said switch in either normally open position, or to move the same to engage said contact, a trigger pivoted to said bracket at the same center as the switch blade and having a lost-motion engagement with a portion of said blade, a spider pivoted to said bracket having means engageable with the cartridge whereby the spider partakes of the cartridge movement, and having means engageable with said trigger, movement of the cartridge con-



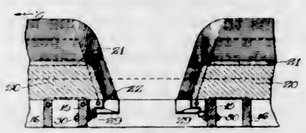
trolling said spider to permit the trigger to be temporarily positioned to be engaged by the cartridge whereby the trigger is caused to over-center the switch blade, said spring independently closing the blade, said means for setting the trigger being adapted to reset the same and to effect over-centering opening of the switch blade.

2,102,254
METHOD AND APPARATUS FOR BUILDING SEA WALLS
James B. Brockhurst, Red Bank, N. J.
Application May 21, 1934, Serial No. 727,449
16 Claims. (Cl. 61—52)



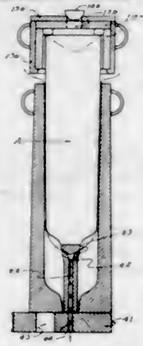
1. The method of building sea walls and the like which consists in erecting a coffer dam extending below the bottom of the desired structure, in placing successive massive blocks in the upper portion of the said coffer dam, and in lowering the blocks by scouring out the material beneath the block and discharging it between the block and the coffer dam.

2,102,255
PROCESS FOR THE MANUFACTURE OF COMPOSITE GLUE PRODUCTS
Charles H. Campbell, Kent, Ohio
Application November 6, 1935, Serial No. 48,468
8 Claims. (Cl. 134—46)



1. In a process for the production of a pulverulent, composite glue product, the steps comprising heating a finely divided, inert base, agitating the base with the type of agitation accomplished by mixer arms, during the agitation directing a nebular spray of glue solution upon the surface of the agitated base, and simultaneously directing a flow of hot gas around the glue spray partially to dry the glue before it impacts upon the base material, the total heat being sufficient to dry the glue before substantial agglomeration of base particles occurs.

2,102,256
TELEVISION SYSTEM
Richard L. Campbell, Oaklyn, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 26, 1933, Serial No. 672,963
Renewed October 16, 1936
14 Claims. (Cl. 178—7.2)



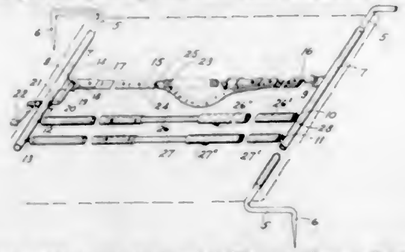
1. In a television transmission system, electron apparatus for developing picture signals, means for developing control signals, means for effecting scanning action of said apparatus and including a generator of an electrical wave of a given frequency, said generator being supplied with said control signals and maintained in operation thereby at said given frequency, and means supplied with electrical impulses from said generator and operating to develop therefrom synchronizing impulses for transmission.

2,102,257
FURNACE CONSTRUCTION
George L. Danforth, Jr., Chicago, Ill., assignor to Open Hearth Combustion Company, Chicago, Ill., a corporation of Delaware
Application August 21, 1936, Serial No. 97,165
2 Claims. (Cl. 263—46)

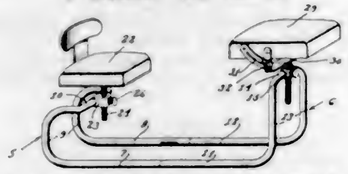
1. In a furnace, a wall of the furnace having a doorway formed therein, the outer face of the wall being substantially vertical and the inner face of the wall being upon such an angle that bottom-making material will lie on said wall, bottom-making material extending up on said wall, the doorway in the wall having downwardly and inwardly inclined sides whereby the bottom of the doorway is narrower than the top, and the doorway being larger on the inner face of the wall than upon the outer face of the wall, the opening flaring toward the inside of the furnace.

2,102,258
METHOD OF PRODUCING INGOTS
George A. Dornin, Baltimore, Md.
Application March 26, 1931, Serial No. 525,525
25 Claims. (Cl. 22—216)

3. The method of treating ingots comprising directly surrounding the skin of an ingot with a confined treating atmosphere while the major portion of the body of the ingot metal is still molten, controlling the movement of said atmosphere, and varying the movement of said atmosphere over different portions of the skin of the ingot in direct contact therewith to increase the cooling rate of the lower portion of the ingot relative to the rate of cooling of the upper portion to effect the freezing of the molten interior of the ingot from the bottom upward.



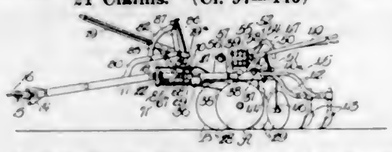
2,102,259
PIPE CUTTING AND WELDING BENCH
Paul A. Edwards and Martin G. J. Gross, Pittsburgh, Pa., assignors to G. F. Higgins Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 9, 1936, Serial No. 104,902
23 Claims. (Cl. 29—33)



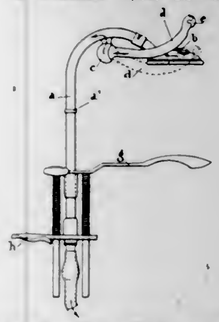
1. A work bench of the class described, comprising a supporting structure having a main bench portion having means to receive and support a length of straight pipe, supporting means for holding fittings of different diameters located adjacent to but beyond one end of the bench having means thereon for engaging and holding fittings over a range of sizes in position to be welded to such straight length of pipe, and means for effecting relative vertical movement between the supporting means on the bench and the supporting means for the fittings to maintain the pipe and the fittings in horizontal alignment whereby the bench can be used with pipes and fittings over a range of diameters.

2,102,260
GRAVE CONCEALING DEVICE
Emil M. Elder, Cleveland Heights, and Wayne D. Goodyear, London, Ohio, assignors, by direct and mesne assignments, to The Joseph M. Stern Company, Cleveland, Ohio, a corporation of Ohio
Application September 25, 1937, Serial No. 165,738
9 Claims. (Cl. 27—30)

3. In grave concealing apparatus, a pair of rotatable members supported adjacent opposite top edges of a grave, a mat having a portion adapted to overlie at least a part of the grave opening, a supporting member secured to said portion of said mat and adapted to extend across the grave opening between said rotatable members, means on said rotatable members adapted to support said mat supporting member, and means for controlling the rotation of said rotatable members whereby said mat may be supported over the grave opening or permitted to drop thereinto.

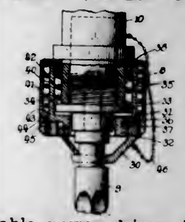


2,102,261
CHIROPODIST'S STOOL
Harold C. Fotre, Chicago, Ill., assignor to The Scholl Mfg. Co., Inc., Chicago, Ill., a corporation of New York
Application March 25, 1935, Serial No. 12,787
4 Claims. (Cl. 155—2)



1. In a stool of the character described, a base comprising a pair of U-shaped members each having the parallel legs thereof bent at an intermediate point to elevate the cross leg leaving the remainder of the parallel legs for disposition on the floor, the free ends of the parallel legs of each member being arranged for telescopic connection with the legs of the other member, a seat supported by one elevated cross leg, and a rest supported by the other elevated cross leg.

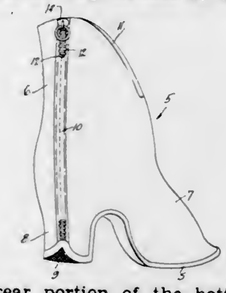
2,102,262
TRACTOR LISTER CULTIVATOR
William S. Graham, Canton, Ill., assignor to International Harvester Company, a corporation of New Jersey
Application January 31, 1936, Serial No. 61,827
21 Claims. (Cl. 97—143)



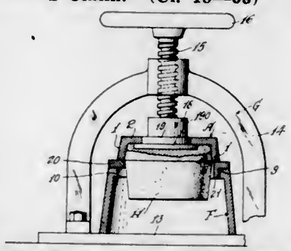
1. A lister cultivator comprising a frame member, a plurality of cultivator units, draft means pivotally connecting said cultivator units to said frame member for movement relative to each other and to the frame member, and means mounted on said frame member and connected to said draft means for equalizing the position of the line of draft of said cultivator units about the line of draft of said lister cultivator.

2,102,263
SALIVA EJECTOR
Hubert Grunewald, Paris, France
Application May 6, 1935, Serial No. 20,038
In Germany July 26, 1934
8 Claims. (Cl. 32—33)

7. An apparatus for collecting saliva from the inside of the mouth, which comprises, in combination, at least one hollow element provided with an inlet opening adapted completely to cover the outlet of at least one salivary duct whereby said duct then opens into a closed chamber formed by said element, said element being of centrally bifurcated arcuate shape, and a suctions means connected with said element.



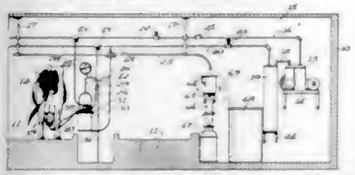
2,102,264
TOOL RETAINER FOR PORTABLE POWER DRIVEN TOOLS
Joseph F. Haas, Forest Park, Ill., assignor to Wodack Electric Tool Corporation, Chicago, Ill., a corporation of Illinois
Application May 19, 1934, Serial No. 726,515
5 Claims. (Cl. 121—32)



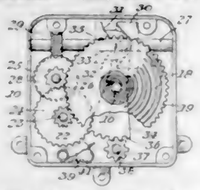
1. In a portable power driven tool having a barrel and a tool reciprocable in one end thereof, means for removably retaining the tool in position in the barrel comprising an arcuate retaining member having inturned flanges at opposite ends for respectively engaging the barrel and the tool, said barrel having a part provided with a groove to receive one flange of said retaining member, said part being resiliently mounted on the barrel proper to cushion the shock on said retaining member of the reciprocable movement of the tool, and disengageable means resiliently urged into locking position for locking the retaining member in position on the end piece.

2,102,265
OVERSHOE AND THE LIKE
Bert Halberstadt, New York, N. Y.
Application February 25, 1937, Serial No. 127,585
1 Claim. (Cl. 36—7.3)

An article of foot wear of the character described comprising a sole, an upper having a vamp and a rear section including a heel enclosing portion, a bottom wall for the heel enclosing portion having its rear portion extended upwardly, the said vamp and rear section being formed of soft material and the rear section being provided with an unobstructed slit extending from the top thereof to the upwardly extending rear portion of the bottom wall of the heel so that a foot of the wearer may be readily inserted from the rear and the upwardly extending portion of the bottom wall of the heel will serve to reinforce the lower end of the slit, a slide fastener section secured to each side edge of the slit, and a slide for separating and uniting said fastener sections.



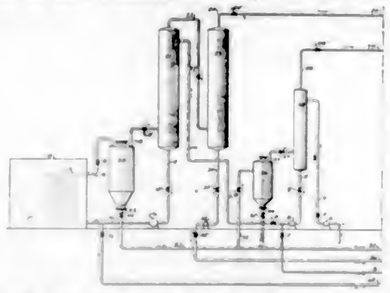
2,102,266
APPARATUS FOR REMOVING CONTENTS OF FLASKS
Edward J. Handler, Irvington, N. J.
Application June 29, 1937, Serial No. 150,902
1 Claim. (Cl. 18—33)



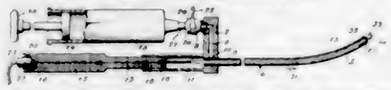
Apparatus for removing material from a flask which comprises two hollow complemental sections, one being cup-shaped and the other being hollow with open ends and the edges of said sections being in abutting relation, said hollow section having a plurality of projections on the outer side of its wall and the other section having an opening in its bottom wall and a plug slidable in said opening to close it, and said flask containing material exposed through one end of said hollow section, said apparatus comprising a hollow jack frame having a rim at one end to receive and cooperate with said projections on the hollow flask section and support said flask with the cup-shaped section in suspended relation and free from said jack frame, an adaptor ring to separably seat on said rim to receive and support said cup-shaped section up-side down at its edge, a press comprising a base to support said jack frame, a yoke mounted on said base, and a screw in said yoke movable toward and from said base with one end formed to engaged said plug and pass through said opening in the cup-shaped section and to engage the material in said hollow section at the end of the latter opposite said jack frame, whereby to force the material from said flask sections.

2,102,267
PRESSURE RELEASER MILKING SYSTEM
Floyd G. Hodsdon, Milwaukee, Wis., assignor to International Harvester Company, a corporation of New Jersey
Application March 24, 1937, Serial No. 132,676
8 Claims. (Cl. 31—58)

1. In a releaser milker system, a milk receiver pail to receive milk from a milking machine, a vacuum pipe to supply vacuum to the pail and machine, a milk pipe in the system including a connection with the pail, the combination with said pail of a source of compressed air, means to cut off the vacuum supply to the pail, and means to supply compressed air from said compressed air supply to the pail whereby the milk in the pail will be forced therefrom into the milk pipeline through its connection with the pail.



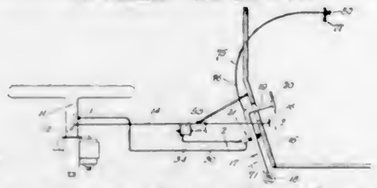
2,102,268
WINDSHIELD WIPER
David Hoppenstand, Pittsburgh, Pa.
Application April 2, 1935, Serial No. 14,251
2 Claims. (Cl. 185—37)



1. A windshield wiper comprising an oscillatable shaft having a wiper arm thereon, an oscillatable gear segment for driving a pinion on said shaft, a barrel cam having its axis at right angles to said shaft and having a sinuous groove therein, a follower rigid with said segment cooperating with said groove, and a motor for driving said cam.

2,102,269
CRACKING OF HYDROCARBON OILS
Lyman C. Huff, Chicago, Ill., assignor, by mesne assignments, to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application February 26, 1930, Serial No. 431,405
Renewed April 30, 1935
5 Claims. (Cl. 196—49)

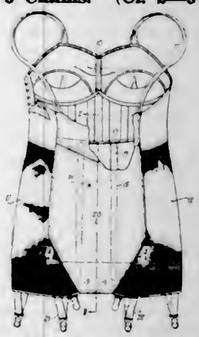
1. A hydrocarbon oil cracking process which comprises initially cracking the oil in a primary cracking zone under sufficient pressure to retain a substantial portion thereof in the liquid phase, separating the thus treated oil into vapors and unvaporized oil, simultaneously cracking a condensate separated from said vapors in the vapor phase in a second cracking zone, flash distilling said unvaporized oil by pressure reduction and dephlegmating the resultant flashed vapors independently of the vapor phase cracked vapors from said second cracking zone and in contact with fresh charging oil for the process thereby forming a mixture of unvaporized charging oil and flash reflux, dephlegmating the vapors from said primary cracking zone and the vapors from said second cracking zone in contact with portions of said mixture, then supplying the charging oil and resultant reflux condensate to the primary cracking zone, and condensing the dephlegmated vapors.



2,102,270
ELECTROSURGICAL DEVICE
Mortimer N. Hyams, New York, N. Y.
Application November 29, 1935, Serial No. 52,037
2 Claims. (Cl. 128—303.17)

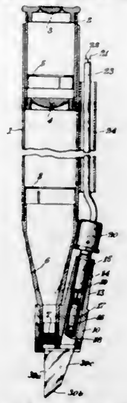
1. In combination with a medical instrument comprising a tube, an electrode adjacent one end of said tube, a handle adjacent the opposite end of said tube, an insulated conducting wire connecting said handle with said electrode and situated within said tube, and means connecting said wire to a source of electrical energy, said handle, said wire and said electrode being movable relatively to said tube, a free space being provided within said tube between the inner surfaces thereof and the outer surfaces of said insulated conducting wire for the passage of a fluid, a support firmly connected with said opposite end of the tube, a passage being formed in said support which is in communication with the interior of said tube, and a syringe carried by said support and in communication with said passage.

2,102,271
AUTOMATIC THROTTLE
Frank J. Irving, Los Angeles, Calif.
Application November 28, 1933, Serial No. 700,095
11 Claims. (Cl. 192—.01)



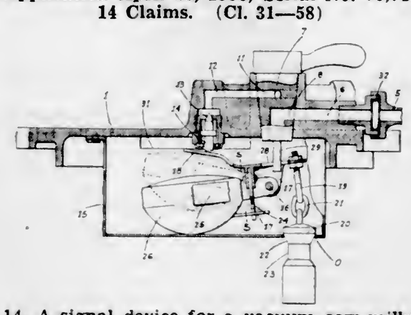
1. In a device as described the combination of an engine provided with an intake manifold having a throttle valve and developing a suction in the manifold and a clutch controlled by a movable clutch lever, a suction operated power device, an interconnection between said power device and throttle, a suction operated valve and a suction air connection between the intake manifold and the intake manifold and the valve, and between the valve and the power device, the said valve having a valve closure normally seated when subjected to suction, and an operative means interconnecting between the valve and the clutch lever to open the valve on closing of the clutch thereby giving a suction connection between the intake manifold and the power device.

2,102,272
FILING CABINET SHELL
Frank D. Jonas, East Williston, N. Y., assignor to Oxford Filing Supply Co., Brooklyn, N. Y., a partnership composed of Richard A. Jonas, Richard A. Jonas, Jr., Robert P. Jonas, Frank D. Jonas, and Edward F. Jonas
Application March 31, 1934, Serial No. 718,447
2 Claims. (Cl. 45—2)



1. A combination comprising a plurality of open end filing cabinet shells arranged in at least two columns of adjacent stacks, each shell being made of flexible, fibrous material, and having a reinforcing metal column of hollow section secured to the sides of the open ends thereof, means for interlocking adjacent shells comprising a metal key lying in the adjacent ends of the columns and having a central peripheral boss to space the columns and means interconnecting the adjacent keys at the bosses of adjacent stacks to lock the stacks together.

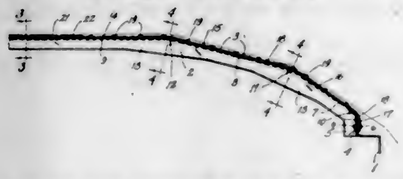
2,102,273
CORSET, GIRDLE, AND THE LIKE
Mario Laguzzi, West Haven, Conn., assignor to The Strouse Adler Company, New Haven, Conn., a corporation of Connecticut
Application November 15, 1935, Serial No. 49,867
5 Claims. (Cl. 2—37)



1. A garment of the class specified having a back section of material substantially non-elastic in the vertical direction extending below the waist and the edge of which, at its lower portion, from both sides of it and from some distance above the lower edge of the garment, extends toward the centerline of the back, and a section of material, elastic in the vertical direction, at each side of said back section and extending from substantially the waist of the wearer to the lower edge of the garment and attached to the edge of said back section at both sides of and throughout the length of said back section below the waist, thereby having portions located between said back section and the lower edge of the garment as well as at both sides of said back section.

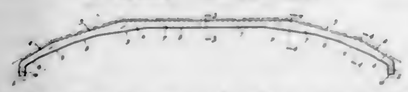
2,102,274
MICROSCOPE FOR PATHOLOGICAL RESEARCH
Louise D. Larimore, New York, N. Y.
Application June 29, 1934, Serial No. 732,962
3 Claims. (Cl. 128—6)

1. In a compound microscope, the combination with a tubular body, an eyepiece, and an objective, of a wedge-shaped transparent contact member projecting from said tubular body and having a contact surface parallel with the line of vision and a reflecting surface in the line of vision constructed and arranged to totally reflect light rays from said contact surface to the objective of said compound microscope, and an illuminating lamp arranged alongside of and screened from said objective in position to direct its light rays to said contact surface by total reflection from said reflecting surface.



2,102,275
AUDIBLE SIGNAL FOR MILKING MACHINES
Philip H. J. Martin, Sacramento, Calif.
Application April 28, 1936, Serial No. 76,741
14 Claims. (Cl. 31—58)

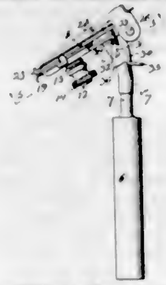
14. A signal device for a vacuum cow milking machine including an audible signal mounted in



connection with the machine, a normally closed valve to control the actuation of the signal and a means to open the valve upon completion of the milking operation.

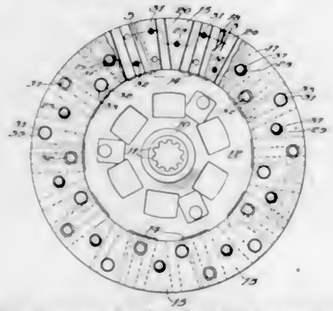
2,102,276
CAR ROOF
Walter P. Murphy, Chicago, Ill., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application October 3, 1936, Serial No. 103,832
12 Claims. (Cl. 108—5.4)

1. A car roof comprising side plates, carlines extending from side plate to side plate, roof sheets extending from side plate to side plate and a runway, the upper surfaces of the carlines and sheets conforming substantially to the established tunnel clearance outline throughout the width of the car and of the sheets with their ridge portions horizontal and spaced low enough for the runway to clear said outline, and said runway comprising expanded metal laid directly on the roof sheets throughout its length.



2,102,277
CARLINE
Walter P. Murphy, Chicago, Ill., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application October 3, 1936, Serial No. 103,833
3 Claims. (Cl. 108—5.6)

1. A carline for car roofs whose upper surface substantially conforms to the established tunnel clearance outline and whose lower surface has certain portions, which are substantially parallel with but of shorter length than the adjacent portions of the upper surface, and other portions, which connect the ends of said short portions and substantially increase the depth of the carline in the regions of the breaks in its upper surface.

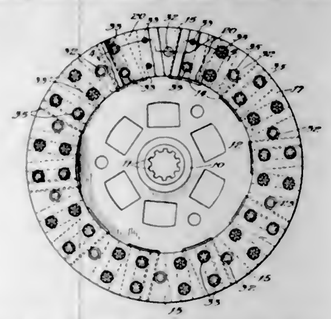


2,102,278
SAFETY RAZOR
William Myer, New York, N. Y.
Application August 8, 1935, Serial No. 35,241
3 Claims. (Cl. 30—58)

2. A safety razor including a handle having a head mounted thereon of substantially triangular shape against the top surface of which the blade is adapted to rest, a comb member to cooperate with one of the cutting edges of the blade adjacent one of the edges of said triangular head and a non-flexing triangularly shaped blade having an aperture therein, an angular and revolvable blade engaging member on said head adapted to be received in the aperture of said blade, a stud on said blade engaging member extending downwardly through an aperture in the head, a spring on said stud urging said blade engaging member downwardly, and means below the head for turning said stud and said blade engaging member to turn the razor blade to bring

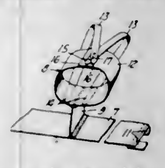
its different cutting edges in co-operative relation with the comb, and means for clamping the blade on said head.

2,102,279
CLUTCH PLATE
George E. Pope, Stratford, Conn., assignor to Raybestos-Manhattan, Inc., Bridgeport, Conn., a corporation of Connecticut
Application February 24, 1937, Serial No. 127,365
12 Claims. (Cl. 192—107)



1. An improved clutch plate, comprising a mounting plate, a pair of annular friction facings disposed in juxtaposed relation on opposite sides of the plate, and means for securing said elements to the plate, including a plurality of overlapping circularly spaced sectoral leaf springs rigidly secured to said plate and to one of said facing elements, whereby application of pressure causes said facings to move toward each other for producing uniform, smooth resilient driving engagement.

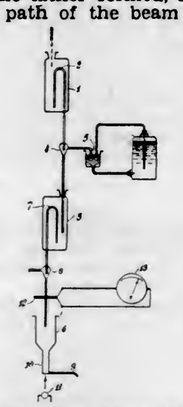
2,102,280
CUSHIONED CLUTCH PLATE
George E. Pope, Stratford, Conn., assignor to Raybestos-Manhattan, Inc., Bridgeport, Conn., a corporation of New Jersey
Application April 17, 1937, Serial No. 137,461
14 Claims. (Cl. 192—107)



1. An improved clutch plate, comprising a mounting plate, a pair of axially spaced apart annular friction facing elements disposed on opposite sides of said plate, resilient means connecting said facings to the mounting plate, and normally maintaining said facings in spaced relation to said plate, said means being formed so that upon compression of the facing elements toward each other one of said facing elements is moved an angular amount relatively to the other facing element for producing smooth and

uniform clutch engagement, and means interconnecting said resilient means with said mount-

ing plate for limiting the amount of axial separation of said facing elements.

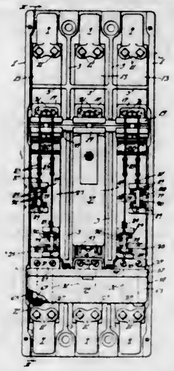


2,102,281
BABY SUPPORT
Mary Pringle, Alameda, Calif.
Application March 11, 1935, Serial No. 10,436
2 Claims. (Cl. 128—134)

1. A baby support comprising, a strap adapted to be secured to a support for supporting the baby when lying down, a body band to encircle the body of the baby and having an intermediate portion thereof normally adapted to engage the back of the baby's body, and a flexible restraining tie of relatively thin material substantially equal in length to the radius of said band and of a character to enable the baby to lie thereon without discomfort, said tie secured to said strap and to the band at the said intermediate portion thereof, whereby with the baby resting on its back it may without turning shift sidewise to either side of a vertically aligned position of the secured points of said tie and strap.

2,102,282
AUTOMATIC APPARATUS FOR DETERMINING THE HARDNESS OF WATER
Cecile Marguerite Roy, Meudon, France, assignor to Societe des Usines Chimiques Rhone-Poulenc, Paris, France
Application April 25, 1936, Serial No. 76,319
5 Claims. (Cl. 23—253)

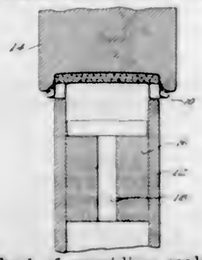
1. An automatic apparatus for the determination of hardness of water comprising a vessel into which flows the water the hardness of which is to be measured, a syphon in said vessel to remove therefrom a definite quantity of water for each determination, a suction injector in the tube from said syphon and adapted to introduce into the water a definite quantity of soap solution, a further vessel into which the mixture of water and soap solution passes whence it is transferred by means of another syphon, a suction injector in the tube from this syphon and adapted to introduce into the mixture a quantity of air whereby a lather is formed, a source of electromagnetic radiations adapted to cast a beam through the lather formed, a photo-electric cell in the path of the beam after it has



passed through the lather, and means for measuring the current passing through the cell.

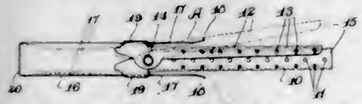
2,102,283
ALLOY STEEL
Byramji D. Saklatwalla, Crafton, Pa.
No Drawing. Application March 6, 1936, Serial No. 67,508
4 Claims. (Cl. 75—125)

2. An alloy consisting of chromium 3% to 8%, copper 2% to less than 5%, molybdenum .6% to 1%, carbon .1% to .25%, manganese .1% to 1%, silicon .5% to less than 1%, and the balance being iron with the exception of incidental impurities such as phosphorus and sulphur.



2,102,284
CIRCUIT INTERRUPTER
Jerome M. Sandin, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 12, 1935, Serial No. 40,193
16 Claims. (Cl. 200—107)

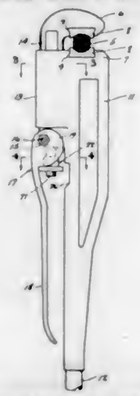
1. In a circuit interrupter, separable contact means for opening and for closing the main electrical circuit therethrough, actuating means for said main contact means mechanically connected thereto, said main contact actuating means having three positions, an open circuit, a closed circuit, and a tripped position, a plurality of auxiliary switching means, said auxiliary switching



means being mechanically connected to be operated by said main contact actuating means, and at least one of said auxiliary switching means being operated when said main contact actuating means is moved to the open circuit and to the closed circuit position and at least one other of said auxiliary switching means being operated by an element of said main contact actuating means which moves only when said main contact actuating means is moved to the tripped position.

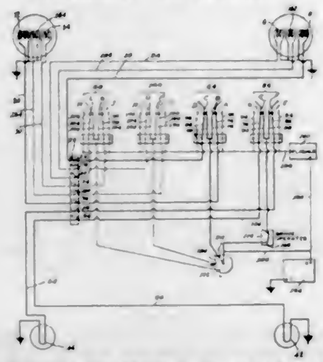
2,102,285
METHOD OF PRODUCING CROWN CAPS
Harry M. Schmidt, Chicago, Ill., assignor to Mitchell & Smith, Inc., Detroit, Mich., a corporation of Massachusetts
Application January 8, 1937, Serial No. 119,638
2 Claims. (Cl. 113—80)

1. The method of providing sealing caps with an impervious facing, which consists in holding the sealing face of the cap in operative engagement with a hollow delivery tube which circumscribes the area of the facing to be applied, delivering to the exposed face of the cap within the tube a dissolved plastic in a liquid phase, and thereafter withdrawing the surplus of dissolved plastic while the cap is still maintained in operative relation to the delivery tube to leave the cap with a relatively thin residuum of plastic film which hardens and assumes solid form upon exposure to air.



2,102,286
HAIR CURLER
William H. Schmitt, St. Paul, Minn.
Application July 12, 1935, Serial No. 31,015
14 Claims. (Cl. 132—33)

1. In a hair curler, a tubular member having holes therethrough, a clamp pivoted to one end thereof and adapted to engage and hold the end strands of hair to be wound on said tubular member, and a slidable clamping member slidably mounted on said tubular member and said clamp and supported substantially parallel thereto adapted to slide over the hair wound on said members to lock the same closed and hold the hair in curling position on said curler.

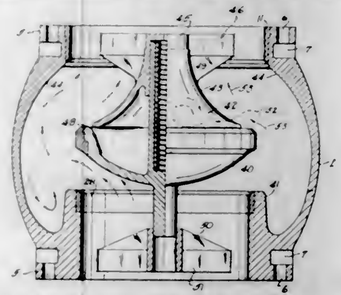


2,102,287
WIRE LINE TWISTER
James A. Smethers, Andrews, Tex.
Application March 26, 1935, Serial No. 13,083
7 Claims. (Cl. 81—87)

1. In a wrench, a pair of clamping jaws, a movable supporting arm structure for one of said jaws, and a cam operating to move said arm structure toward clamping position, said structure having adjustment means cooperating with said cam for varying the jaw opening in clamping position, said adjustment means and

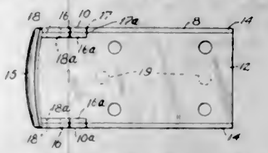
cam having cooperating locking surfaces for maintaining said means in adjusted position, said supporting arm structure also being movable independently of said cam toward clamping position to free said locking surfaces.

2,102,288
SIGNALING MEANS FOR VEHICLES
Roland L. Smith, Belmont, Mass.
Application June 27, 1935, Serial No. 28,616
13 Claims. (Cl 177—337)



7. In a signaling system for vehicles, a source of current, two pairs of filaments, each filament connected to the current source by at least two parallel circuits, one pair of filaments on the right, the other pair on the left of the vehicle, means for lighting simultaneously one filament of each pair of filaments with continuous current, means for discontinuing continuous current to one of said lighted filaments and means for thereafter supplying intermittent current to both filaments of one pair.

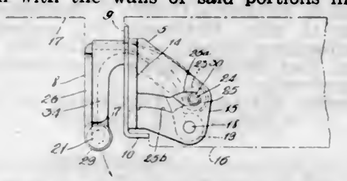
2,102,289
DIRECT FLOW CHECK VALVE
Michael Smolensky, Cleveland, Ohio
Application October 10, 1933, Serial No. 692,974
2 Claims. (Cl. 251—144)



1. A check valve comprising a one piece body arranged for connection with pipes at its ends

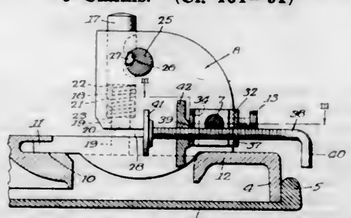
and having a chamber therein of circular cross section and axially aligned entrance and exit passages at the opposite ends of the chamber respectively, a crown about the entrance passage extending into the chamber and defining with the walls thereof a relatively deep annular trough, a closure disk seatable on said crown and movable toward and away from said crown for opening and closing the valve, a spider in the entrance passage, a bearing carried by the spider, a detachable spider in the exit passage, a bearing carried thereby and coaxial with the first

bearing, posts on the disk slidably accommodated by said bearings, a shield integral with the bearing in the exit passage and extending therefrom into the chamber in spaced relation to the walls thereof and flaring radially outwardly toward the disk and terminating at its larger end substantially flush with the limit of the disk nearest the exit passage when the disk is in fully opened position, and a compression spring operatively interposed between the disk and detachable spider and urging the disk to seated position on the crown.



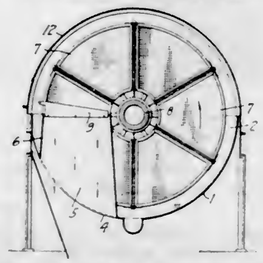
2,102,290
COVERED JOINT HINGE
Joseph Soss, Roselle, N. J.
Application March 14, 1935, Serial No. 10,963
12 Claims. (Cl. 16—148)

9. A hinge comprising two hinge butts, one of said hinge butts being composed of two parts arranged and fitting snugly one within the other, each part of said butt having at one end a curved extension including top and bottom walls continuous with and extending angularly from the upper and lower edges of said extension, and the adjacent top and bottom walls of said parts collectively forming thick pintle bearings.



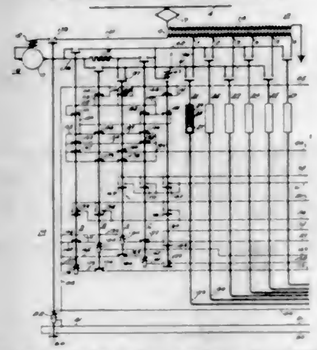
2,102,291
CONCEALED HINGE
Joseph Soss, Roselle, N. J.
Application February 20, 1936, Serial No. 64,830
14 Claims. (Cl. 16—166)

9. A concealed hinge of the class described comprising a butt housing and two hook arm butt parts, one end of each of said parts having an independent mounting in the butt housing, the other end of said parts being pivotally coupled together, both parts comprising a substantially straight outer portion and a curved inner portion with the walls of said portions in sub-



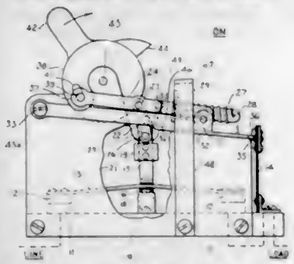
stantially parallel relation with respect to each other when said parts are in closed position.

2,102,292
BACK GAUGE FOR PUNCHES
Charles V. St. Louis and George J. Rundblad, Chicago, Ill., assignors to Wilson-Jones Company, Chicago, Ill., a corporation of Massachusetts
Application October 26, 1936, Serial No. 107,644
6 Claims. (Cl. 164—91)



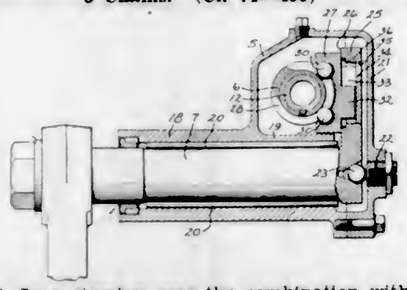
1. In a punch, a back gauge comprising a pair of U-shaped members, a screw extending through said U-shaped members, a flat disk permanently secured to the forward end of said screw, and a lock nut operable to prevent movement of said screw relative to said U-shaped members.

2,102,293
FILTER
Ernest J. Sweetland, Piedmont, Calif., assignor to Oliver United Filters Incorporated, San Francisco, Calif., a corporation of Nevada
Application March 23, 1936, Serial No. 70,316
3 Claims. (Cl. 210—201)



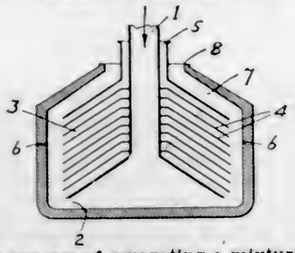
1. A rotary disc filter comprising: a substantially semicylindrical pan; a plurality of spaced filter discs accommodated within said pan; spaced, rectangular openings formed along one side of the bottom of said pan in registration with the spaces between said discs; rectangular hoppers secured to said pan in registration with said openings and extending vertically upward between said discs; said hoppers being spaced from said discs and from the adjacent side wall of the pan; and means for discharging the cake from said discs into said hoppers.

2,102,294
CONTROL SYSTEM
William R. Taliaferro, Charles C. Whittaker, and Lynn G. Riley, Pittsburgh, Pa., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 15, 1935, Serial No. 45,048
7 Claims. (Cl. 171—119)



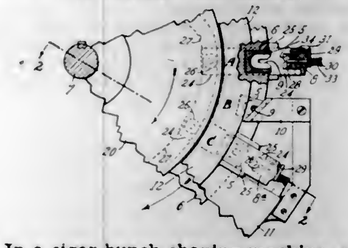
1. In a tap-changing system, in combination, electrical conversion apparatus, a plurality of switches for changing taps on said apparatus, fluid-pressure means for operating said tap-changing switches, circuit-breaking switches for connecting the tap-changing switches to a power circuit, means for controlling the operation of said circuit-breaking switches, and fluid-controlling means actuated by the circuit-breaking switch controlling means for controlling the operation of the tap-changing switches.

2,102,295
CIRCUIT BREAKER
Alfred J. Thomson, Detroit, Mich., assignor to Bulldog Electric Products Company, Detroit, Mich., a corporation of West Virginia
Application March 6, 1933, Serial No. 659,714
Renewed January 11, 1937
22 Claims. (Cl. 200—116)



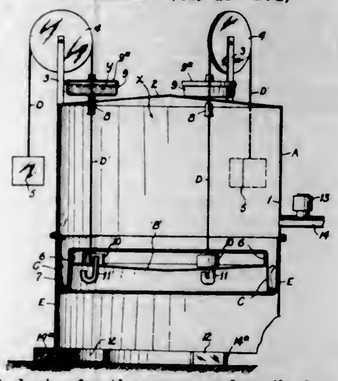
1. In a circuit breaker of the character described, an operating mechanism including an elongated pawl fixedly pivoted at one end to a fixed part, and normally held down at the other end by an overload release part, an operating crank fixedly pivoted to a fixed part and having a reset part for engaging said pawl and resetting it by moving it downwardly after it has been released by said release part and moved upwardly, an operating link connected at one end to said crank by a positive, lost-motion pivotal connection and positioned alongside said pawl, with its aforesaid pivotal connection adjacent the pivotal connection of the pawl, a compression spring on the end of said operating link adjacent the release part, and a spring compression link pivotally connected to the operating link and to the pawl.

2,102,296
STEERING GEAR
B. Wickliffe Twyman, Milwaukee, Wis., assignor to Lavine Gear Company, Milwaukee, Wis., a corporation of Wisconsin
Application November 11, 1935, Serial No. 49,144
3 Claims. (Cl. 74—499)



1. In a steering gear the combination with a worm cam and a rock shaft having a rocker arm member oscillatory adjacent the worm cam, of cam follower member having a portion interposed between said worm cam and arm with its external face in bearing contact with the arm, a bearing block fixed on one of said members and elongated in the direction of the radius of said arm, and a swivel element journaled in the other of said members and provided with a transverse slot in which said block is reciprocable in the relative movement of said members.

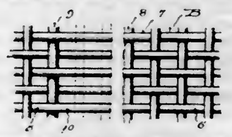
2,102,297
PROCESS AND APPARATUS FOR SEPARATION OF THE COMPONENTS OF A MIXTURE OF MORE THAN TWO COMPONENTS
Henri Walch and Jean Prélas, Paris, France, assignors, by mesne assignments, to The De Laval Separator Company, New York, N. Y., a corporation of New Jersey
Application May 11, 1931, Serial No. 536,500
In Sweden June 11, 1930
7 Claims. (Cl. 233—20)



4. The process of separating a mixture of more than two constituents of which one of the heavier constituents is a relatively free flowing liquid and the other of the heavier constituents is a relatively viscous material, which comprises subjecting the mixture to centrifugal force, effecting separate discharge of the three constituents by so throttling the discharge through which the two heavier constituents tend to escape as to allow the escape therethrough of only the more free flowing of the two heavier constituents and compel separate outflow of the other heavier constituent.

2,102,298
CIGAR BUNCH SHAPER MECHANISM
Henry H. Wheeler, Brooklyn, N. Y., assignor to International Cigar Machinery Company, a corporation of New Jersey
Application March 14, 1936, Serial No. 68,800
16 Claims. (Cl. 131—9)

1. In a cigar bunch shaping machine, a bunch mold for supporting cigar bunches to be shaped, a member having an operative face complementary to the shape of the mold for pressing a bunch into said mold, means for moving said member to and from pressing position in said mold, and stripping means carried by said member for stripping said bunch therefrom during the outward movement of said member.



2,102,299
GASHOLDER
John H. Wiggins, Tulsa, Okla.
Application September 7, 1935, Serial No. 39,529
9 Claims. (Cl. 48—174)

9. A device for the purpose described, comprising a gas storage chamber formed by a stationary member having a side wall and a top wall both of which are fixed or immovable, a vertically movable piston in said stationary member which forms the bottom of said storage chamber, and a flexible sealing element attached to said piston for closing the space between said piston and the side wall of said storage chamber, said flexible sealing element being folded into a loop which depends from said vertically movable piston.

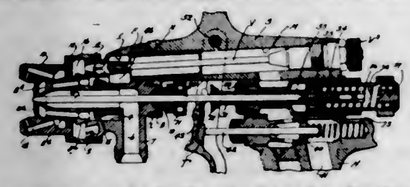
2,102,300
WIRE SEAM
Otto A. Abendroth, Appleton, Wis.
Application April 19, 1937, Serial No. 137,820
2 Claims. (Cl. 245—10)

1. The method of producing a seam in a wire fabric which comprises trimming the warp wires close to the end weft wire of one terminal of the fabric; removing a weft wire from the other terminal and substituting a solid fuse wire therefor; trimming the warp wires of the last mentioned terminal close to the fuse wire; bringing the terminals together with the fuse wire in close relation to the end weft wire and applying heat to the fuse wire to completely melt the same.

2,102,301
METHOD OF MAKING ELECTRIC HEATER ELEMENTS
Edwin E. Arnold, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application June 15, 1935, Serial No. 26,847
2 Claims. (Cl. 201—64)

2. The process of making a heater element comprising a resistive conductor surrounded by insulating material and enclosed in a metallic envelope, which includes the steps of making an elongated shallow envelope member, making an elongated envelope member of a depth greater than the thickness of the insulating material in the finished article with inwardly inclined margins at the edges of its sides, making a cake comprising the resistive conductor surrounded by insulating material and bonded to the shallow member, then inserting said cake with the shallow member endwise into said deep member and flattening the margin against the shallow member.

2,102,302
RESISTOR ELEMENT
Edwin E. Arnold, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application June 15, 1935, Serial No. 26,848
6 Claims. (Cl. 201—69)



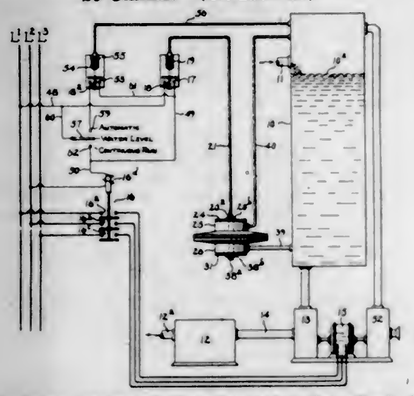
1. A conductive resistor element comprising a sinuous ribbon of sheet metal having transverse portions each in a plane normal to the plane of the element, margin portions joining each pair of successive transverse portions the margin portions being in a plane parallel to the plane of the element, said transverse portions having torsionally twisted portions, one at each end of each transverse portion uniting it to the respective margin portions.

2,102,303
SPRAY GUN VALVE
Svend Bramsen and Fritz Wahlin, Chicago, Ill., assignors to Binks Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application October 31, 1935, Serial No. 47,580
9 Claims. (Cl. 251—134)

1. In a spray appliance, a body member, a trigger of light metal depending in front of the

said body member, a longitudinally movable needle valve extending freely through the said trigger, a tube coaxial with and freely housing a part of the valve behind the trigger and having a diametrically enlarged frontal head part, the tube being supported by and longitudinally slidable with respect to the said body portion, and a hardened metal presser plate fastened to the rear face of the trigger and having an aper-

ture through which the needle valve freely extends; the presser plate having thickened portions at opposite sides of the said aperture for simultaneously engaging portions of the tube head part at opposite sides of the axis of the latter part, which thickened portions have their rear faces convexed as portions of a common cylindrical surface which has its axis substantially intersecting the axis of the needle valve.



2,102,304

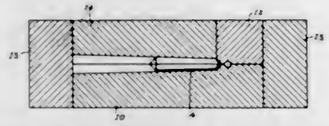
PRESSURE RESPONSIVE DEVICE

Allan P. Charbonneau, Milwaukee, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application September 12, 1935, Serial No. 40,249

20 Claims. (Cl. 137—68)

1. In a device of the character described, in combination, a container adapted to receive a supply of liquid, a housing, a diaphragm located within said housing, means for subjecting the upper surface of the body of liquid within said container and the upper and lower surfaces of said diaphragm to the pressure conditions obtaining above said body of liquid, said means being adapted to additionally subject the lower surface of said diaphragm to a degree of fluid pressure proportional to the height above a given level of the level of liquid within said container, a switch located at a point remote from said housing, operating means for said switch, and means for rendering said operating means subject to control by said diaphragm, said last mentioned means including fluid means for transmitting movements of said diaphragm to said switch operating means.



2,102,305

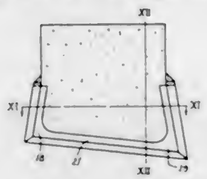
METHOD OF MAKING ABRASIVE TEETH FOR STONE SAWS

George W. Chormann, Niagara Falls, N. Y., and Harry J. Cowie, Niagara Falls, Ontario, Canada, assignors, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Original application September 8, 1933, Serial No. 688,640. Divided and this application February 1, 1935, Serial No. 4,446. Renewed October 30, 1937. In Canada October 24, 1933

7 Claims. (Cl. 76—112)

1. The method of manufacturing an accurately fitting insert tooth for a stone-cutting saw which comprises shaping a sheath for the root of the tooth from sheet metal, placing the sheath in a die, confining an edge portion of the sheath with a supplemental die, introducing onto the die and sheath a mixture of abrasive grain and bonding material, and pressing the same to accurate shape while simultaneously molding edge portions of the root into the sheath.



2,102,306

METAL REINFORCEMENT FOR ABRASIVE TEETH

George W. Chormann, Niagara Falls, N. Y., and Harry J. Cowie, Niagara Falls, Ontario, Canada, assignors, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Application April 24, 1936, Serial No. 76,278

5 Claims. (Cl. 125—22)

1. An insert tooth for a stone-cutting saw comprising an abrasive member having a body and a root both flattened to enter a relatively narrow kerf, and a sheet metal sheath enclosing edges of said root and extending across at least one lateral face of said root, said edges being bevelled to conform to a V-shaped socket and the sheath being correspondingly shaped.

2,102,307

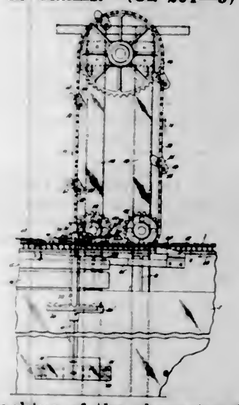
PROCESS FOR PREPARING OIL VARNISHES

August Chwala, Vienna, Edmund Waldmann, Klosterneuburg, near Vienna, and Aldo Martina, Vienna, Austria

No Drawing. Application February 19, 1936, Serial No. 64,652. In Austria February 28, 1935

8 Claims. (Cl. 134—26)

1. A varnish of high luster and good flow containing drying oil and an organic compound having an acetylene linkage selected from the group of organic carboxylic acids and substituted organic carboxylic acids.



2,102,308

AUTOMATIC PLATING CONVEYER

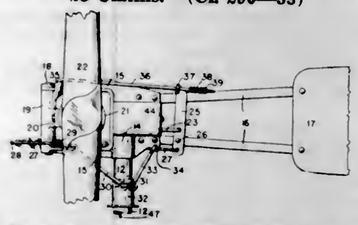
Burton G. Daw, Webster Groves, Mo.

Application March 20, 1936, Serial No. 69,909

13 Claims. (Cl. 204—5)

1. In a machine of the character described, a plurality of carriers for the articles to be plated, an actuator for engaging and moving said carriers horizontally while the articles are immersed in an electrolytic solution, means operated by each carrier for disengaging the next succeeding carrier from said actuator for a short interval only, other means for thereafter disengaging said carriers successively from said actuator and stopping said carriers, a vertical actuator for transferring the carriers from one tank to another successively, and a series of pivoted supports on said vertical actuator for engaging and supporting the carriers during transfer operations.

11. In a machine of the character described, an approximately vertical wall, a carrier frame, a rail for supporting said carrier frame, rollers on said carrier frame operating on said rail and against said wall respectively, for guiding said frame horizontally and vertically, respectively, a continuously moving actuator for engaging and moving said frame horizontally when the articles are immersed in an electrolytic solution, a separate actuator for engaging, lifting, moving laterally and lowering said carrier frame to place certain of said rollers thereon on said rail in transferring the articles from one tank to another while others of said rollers operate against said wall, and mechanisms for operating said actuators, respectively.



2,102,309

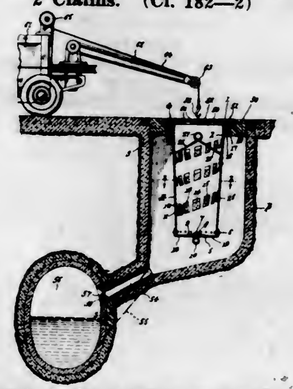
WIND DRIVEN GENERATOR STRUCTURE

William G. Dunn, Clarinda, Iowa

Application April 27, 1937, Serial No. 139,225

23 Claims. (Cl. 290—55)

21. In a wind driven generator structure, a support, a frame member pivotally mounted on said support on a vertical axis and a generator pivotally mounted on said frame member on a second vertical axis spaced from said first axis.



2,102,310

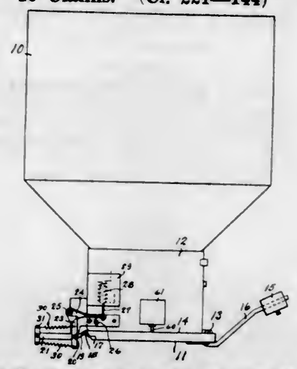
CONSTRUCTION OF SEWERS AND SEWER BASINS AND RECEPTACLES FOR USE IN SEWER BASINS

George F. Egan, Jersey City, N. J.

Application April 4, 1934, Serial No. 719,029

2 Claims. (Cl. 182—2)

1. A receptacle for catching solids for use in a sewer catch basin having a retaining frame, said receptacle fitting in the frame and having side drain ports arranged in a spiral with the distance of the ports from the bottom of the receptacle increasing in successive ports by an amount less than the diameter of a port whereby to effect a constant drain at any height in the receptacle.

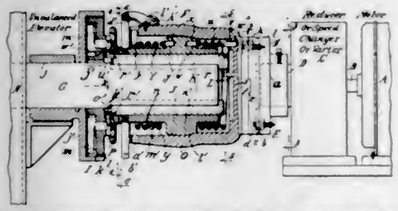


2,102,311

ELECTRICALLY CONTROLLED VALVE MECHANISM

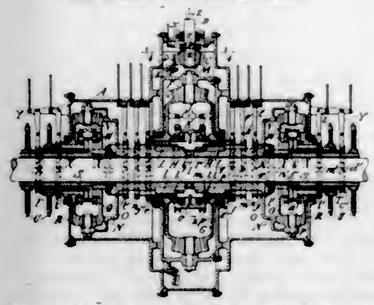
Orin Wallace Fisher and Ralph Edwin Walter, Seattle, Wash., assignors to Fisher Flouring Mills Co., Seattle, Wash., a corporation of Washington

Application May 17, 1935, Serial No. 22,056



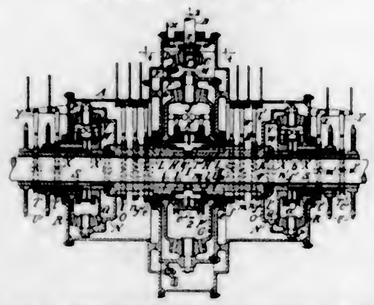
10 Claims. (Cl. 221—144)

1. In mechanism of the class described, a hopper having a discharge opening in its lower portion; a valve operatively positioned across said discharge opening and arranged to be in the path of discharging material when open; movable counterweight means operatively connected with said valve tending to close said valve, said counterweight means moving to a substantially balanced position in which it exerts substantially no



closing force on said valve when the valve is in a fully open position; and means positioned in the path of travel of said counterweight means engageable by said counterweight means when the counterweight means is in said substantially balanced position, said means affording a relatively light predetermined pressure urging the counterweight means out of balanced position, whereby a relatively light predetermined pressure tending to close said valve, when fully open, is provided.

2,102,312
COUPLING OR OTHER TRANSMISSION DEVICE
George Holt Fraser, Brooklyn, N. Y.
Application May 12, 1932, Serial No. 610,807
Renewed July 15, 1937
33 Claims. (Cl. 192—12)

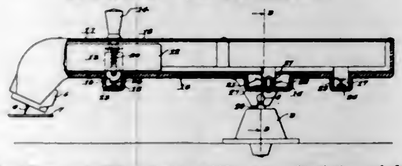


1. In rotation transmissions, a rotary driver member, for receiving and transmitting rotation, and a rotary driven member rotative with and relatively to said member, for receiving and transmitting rotation therefrom, and for permitting relative rotation of said members, said members having adjacent reciprocal transmission faces having semi-cylindrical reciprocal keyway provisions in their adjacent portions, for permitting rotative connection of said members, the combination therewith of a radially yieldable semi-cylindrical oscillatory key oscillatorily mounted in one of said keyways and movable therein into and out of engagement with the other of said keyways, for drivingly disengaging said members when in one position and for circumferentially yieldingly drivingly engaging said members when in another position, for yieldingly transmitting such rotation, and means for moving said key.

2,102,313
DRIVE AND DIFFERENTIAL
George Holt Fraser, Brooklyn, N. Y.
Original application November 21, 1932, Serial No. 643,664. Divided and this application November 16, 1935, Serial No. 50,223
20 Claims. (Cl. 74—316)

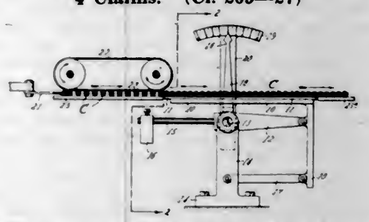
1. In rotation transmissions, members revoluble together and differentially about the same axis, one having a rotation permission and prevention clutch provision axially intermediate of said members and in operative relation to the other thereof, and rotation permission and differentiation prevention movable clutch means axially intermediate of and common to said members, rotatable with one thereof and in revoluble engagement with and revoluble relatively to said clutch provision of the other of said members when in one position, and in differentiation prevention engagement with and revoluble with said provision when in another position, and means for moving said clutch means.

2,102,314
DRIVE AND DIFFERENTIAL
George Holt Fraser, Brooklyn, N. Y.
Continuation of application Serial No. 643,664, November 21, 1932. This application November 20, 1935, Serial No. 50,674
32 Claims. (Cl. 74—316)



1. In a differential drive comprising a master gear, an orbital pinion revolved by said gear and rotatable on an axis radially of said gear, differential gears revolved by and revoluble as to said orbital pinion, and driven axles driven by said differential gears respectively, a rotatable master pinion in mesh with said master gear, for revolving the latter, a rotatable drive shaft on which said master pinion is rotatably mounted, for driving said master pinion, and a drive discontinuance drive connection between said master pinion and said drive shaft comprising reciprocal keyways in the adjacent peripheries of said master pinion and said shaft, and a radially yieldable movable key movable into and out of driving engagement with said keyways for drive connection and drive disconnection of said master pinion and said drive shaft, and yieldable circumferentially of said peripheries, for yieldably resisting drive torque, for yieldable drive connection and disconnection of said master pinion and said drive shaft, for yieldably controlling drive of said master gear.

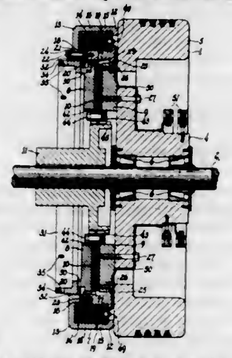
2,102,315
PROCESS OF PREPARING AN ENZYME FROM MOLD
Wolfgang Grassmann and Hans Rubenbauer, Munich, Germany, assignors to August Karreth, Munich, Germany
No Drawing. Application January 22, 1934, Serial No. 707,740. In Germany January 26, 1933
16 Claims. (Cl. 195—66)



1. The process of preparing an enzyme preparation which comprises cultivating a mold on a non-alkaline nutrient medium containing a cellulose substance, continuing the cultivation of the culture beyond the mycelium stage and up to the formation of spores, extracting the culture mass and concentrating the extract to produce an enzyme preparation which has a lichenase value of 0.5 to 1.0 and is effective to split cellulose an hemi-cellulose.

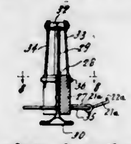
2,102,316
PHONOGRAPH RECORDING CONTROL SYSTEM
Emile C. Guedon, Audubon, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 31, 1935, Serial No. 34,015
21 Claims. (Cl. 179—100.41)

1. The combination with an electric pickup device for recording and reproducing phonograph records and the like, of means for adjusting the stylus pressure thereof on a record surface and means for changing electrical connections therewith in predetermined relation to the adjustment of said stylus pressure.



2,102,317
CIGARETTE WEIGHER FOR CONTINUOUS-ROD CIGARETTE MACHINES
George W. Gwinn, Hewlett, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application September 7, 1935, Serial No. 39,601
4 Claims. (Cl. 265—27)

1. The combination with a weighing device provided with a platform adapted to support a predetermined number of cigarettes in side by side formation, of means for delivering cigarettes sidewise to said platform and simultaneously removing cigarettes therefrom to maintain a constant number of cigarettes on the platform, said means including a set of stationary guide rollers arranged adjacent each end of said platform, endless conveyor belts trained over said guide rollers and platform, a driving pulley over which said conveyor belts are looped, said belts being slack between the driving pulley and platform, drag rollers pressing said belts against said driving pulley, an idler pulley over which said belts are looped, a pressure roll holding said belts against said idler pulley, and mechanism for delivering cigarettes sidewise on to said belts above the set of guide rollers adjacent the slack in the belts.

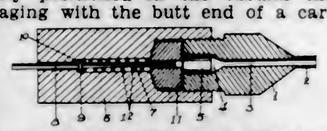


2,102,318
ELECTROMAGNETIC CLUTCH
Howard E. Hodgson, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Application November 29, 1935, Serial No. 52,107
6 Claims. (Cl. 192—84)

1. In an electromagnetic clutch, in combination, a driving element having cooperating field and armature members of annular form, a pair of friction elements mounted within the opening in said field member, one of said friction elements being fixed to said field member and the other being coupled directly to said field member to

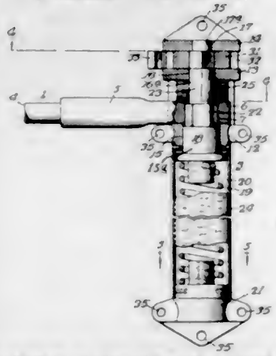
rotate therewith and being movable toward said former friction element by said armature member upon attraction of the latter and a driven friction element to be clamped between said pair of friction elements upon attraction of said armature member.

2,102,319
COMBINATION MOP
Charlotte Huber, New York, N. Y.
Application May 8, 1936, Serial No. 78,596
In Yugo-Slavia May 25, 1935
1 Claim. (Cl. 15—120)



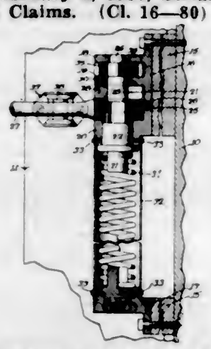
A device of the class described, comprising a substantially cylindrical body having a central axial bore extending therethrough, a rod slidably mounted in said opening and extending from both ends of said body, a handle on one end of said rod, a base member on the other end of said rod and having an opening therethrough, a frame secured to the lower end of said body and comprising a pair of oppositely extending members, each of said frame members having a pair of spaced-apart substantially radial arms united at their outer ends, said device being adapted to have a cloth trained about said frame and through said opening in said base member, means for releasably locking said cloth on said frame, said handle having a pair of side members pivotally mounted thereon, said side members being adapted to be folded down against said body, and a resilient ring loose on said body adapted to encircle said body and said side members when the latter are in folded down position to releasably lock said side members against said body.

2,102,320
BEARING OBSTRUCTION EJECTOR
Leon Kandarian, Oakland, Calif.
Application September 9, 1936, Serial No. 99,976
3 Claims. (Cl. 184—105)



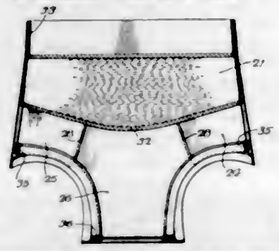
1. A bearing obstruction ejector comprising an elongated member having means at one end

for attachment to a structure which is to be freed of an obstruction, the said member and the said means having a longitudinal opening therethrough, the portion of the opening located in the means being restricted and another portion of the opening being enlarged to provide a seat for a cartridge; a tubular member removably secured to the elongated member; a block removably positioned in the tubular member for engaging with the butt end of a cartridge



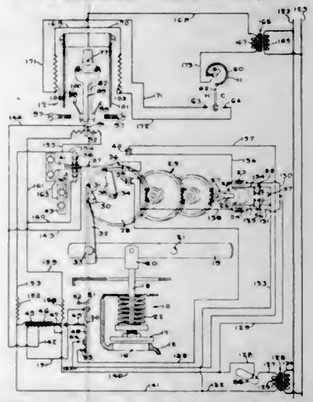
which is positioned in the seat in the elongated member, whereby the cartridge is prevented from moving rearwardly when fired; a firing pin movably extending through the tubular member and the block, having one end projecting to a point outside the tubular member and its other end normally positioned adjacent the butt end of the cartridge; and spring means for moving the firing pin to its normal position after it is actuated against the butt end of the cartridge.

2,102,321
DOOR CLOSER
William J. Keene, Chicago, Ill., assignor to Chicago Spring Hinge Company, Chicago, Ill., a corporation of Illinois
Application July 18, 1936, Serial No. 91,272
5 Claims. (Cl. 16—76)



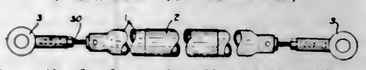
1. In a device of the class described, a pair of spaced frame members, a tube extending between said frame members, a coil spring positioned within said tube and anchored at one of its ends to one of said frame members, the other of said frame members including a pair of spaced brackets integral therewith, a short shaft extending between and journaled upon said brackets, said short shaft being connected at one of its ends to the other end of said coil spring, and the portion of said short shaft which extends between said spaced brackets being divided into a flat sided section and a section of substantially less cross sectional area than said flat sided section, a closer arm having a hub at one end thereof which is adapted to be disposed about and to lockingly engage said flat sided section of said shaft, and a collar normally positioned about said reduced area section of said shaft, said collar locking said hub in place upon said flat sided section of said shaft and being removable to permit said hub to be moved onto said reduced area section in which position adjustment may be made in the angular position of said closer arm on said short shaft.

2,102,322
DOOR CLOSER
William J. Keene, Chicago, Ill., assignor to Chicago Spring Hinge Company, Chicago, Ill., a corporation of Illinois
Application February 4, 1937, Serial No. 123,943
2 Claims. (Cl. 16—80)



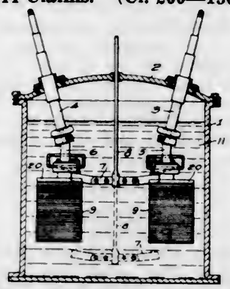
1. In combination with a door frame and a refrigerating room door vertically hinged at one edge thereof on a vertical member of said frame so as to open outwardly, said door being hinged in such a manner that a substantial portion of the thickness of said door projects outwardly beyond the hinge axis, a bracket mounted on said vertical frame member, a vertical shaft journaled in said bracket, an arm carried by said shaft and extending laterally therefrom and crosswise of said portion of the thickness of the hinged edge of the door which projects outwardly beyond said hinge axis, means on the hinged edge of said door outwardly of said hinge axis for engaging said arm, said arm being of such short length as not to project substantially beyond the plane of the outside of the door, and a spring tending to turn said shaft in a direction to cause said arm to bear on said roller to thereby effect closing of the door, the axis of said shaft being so located relative to said hinge axis that when the door is opened, the point of engagement between said arm and said means moves outwardly to progressively increase the lever arm length of said arm as the tension of said spring increases during the opening movement of the door.

2,102,323
SWIMMING TRUNKS
Arthur R. Kneibler, Kenosha, Wis., assignor to Coopers Incorporated, Kenosha, Wis., a corporation of Wisconsin
Application March 19, 1937, Serial No. 131,759
5 Claims. (Cl. 128—159)



2. A swimming garment comprising outer trunks, and relatively independent inner trunks of different material than said outer trunks, said outer and inner trunks having their waist portions united, said inner trunks having a wide waist portion of relatively strong, elastic material constituting an abdominal support, and a lower portion of softer less elastic material, said lower portion having a body supporting crotch part of material which is elastic transversely and relatively inelastic longitudinally of the garment, said crotch part being secured to and thereby supported from said waist band.

2,102,324
CONTROL SYSTEM
Carl G. Kronmiller, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application June 22, 1935, Serial No. 27,956
26 Claims. (Cl. 236—9)



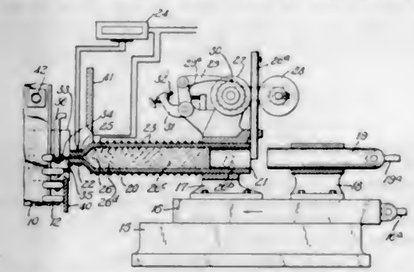
6. A system of the class described, comprising, in combination, a condition changing device, a control member normally moved in accordance with changes in the value of a condition which is affected by the condition changing device, connections between said control member and condition changing device by which the former controls the latter, mechanism associated with said control member and operative to move the same to either of its extreme control positions and maintain it therein irrespective of changes in the value of said condition, and means responsive to another condition in control of said mechanism and operative to move the same to one of its extreme control positions when the value of said second condition rises to a predetermined maximum and to move the same to its other extreme control position when the value of said second condition falls to a predetermined minimum.

2,102,325
AIRPLANE CONTROL ROD AND METHOD OF MAKING THE SAME
John Kylstra, Seattle, Wash., assignor to Boeing Aircraft Company, Seattle, Wash., a corporation of Washington
Application June 9, 1936, Serial No. 84,284
7 Claims. (Cl. 29—148.2)

6. A method of constructing composite tubes, which comprises sliding a short sleeve lengthwise over a long tube into a position between the ends of the latter, from opposite sides of the sleeve applying thereto a slight swaging force over its entire length, from opposite sides of the sleeve spaced angularly from the sides from which the next previous force was applied again applying thereto a slight swaging force over its entire length, and from successively angularly spaced opposite sides of the sleeve recurrently applying thereto such slight swaging forces over its entire length, to swage the sleeve and that portion of the tube lying immediately therebeneath uniformly inwardly to the desired smaller diameter.

2,102,326
CIRCUIT BREAKER
Winthrop M. Leeds, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Original application May 20, 1930, Serial No. 453,909. Divided and this application November 11, 1933, Serial No. 697,647
44 Claims. (Cl. 200—150)

1. The combination with a circuit interrupter having separable contact members for drawing an arc, and a plurality of insulating plates having alined slots adjacent to the arc path, of magnetic plates associated with a portion of said insulating plates for moving the arc in the space formed by said slots, and a coil associated with the remaining portion of said plates for increasing the force to move the arc when the arc is moved into the slots of the last said portion of the plates.



2,102,327
CERAMIC PATCHING CEMENT
John M. McKinley, East Cleveland, and Willard K. Carter, Columbus, Ohio, assignors to National Aluminate Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Original application September 25, 1933, Serial No. 690,883. Divided and this application September 30, 1935, Serial No. 42,882
3 Claims. (Cl. 106—10)

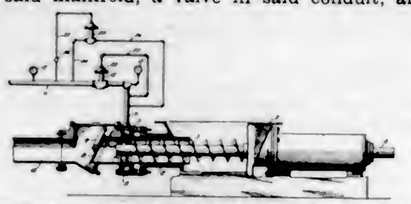
1. A refractory patching cement comprising grog, clay, and about 1% of sodium aluminate.

2,102,328
METHOD OF MAKING THERMOPLASTIC FASTENERS
Louis H. Morin and Davis Marinsky, Bronx, N. Y., assignors to Whitehall Patents Corporation, New York, N. Y., a corporation of New York
Application October 4, 1934, Serial No. 746,771
10 Claims. (Cl. 18—59)

1. The herein described method of manufacturing stringers of separable fasteners, which consists in arranging the mounting strip of the stringer between casting dies movable toward and from each other, the dies having an impression around a portion of the strip disposed therebe-

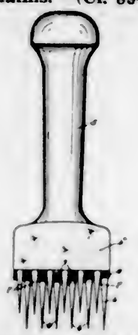
tween, providing a cylinder containing thermoplastic material with a nozzle at one end of the cylinder, heating the cylinder, maintaining the thermoplastic material soft and moldable at the nozzle end of the cylinder and at different degrees of softness in a direction away from said nozzle and substantially hard at the outer feed

end of the cylinder, moving the nozzle toward and from the dies, and applying pressure to the thermoplastic material in the cylinder to discharge said material from the nozzle thereof into the impression of said dies along the parting line thereof to form a thermoplastic link cast directly upon that portion of the strip disposed within the impression of said dies.



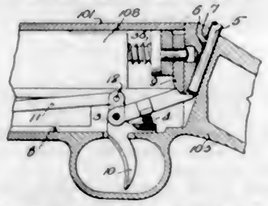
2,102,329
PACKAGE
Arthur J. Nelson, Milwaukee, and John H. Olsen, Whitefish Bay, Wis., assignors to Pulp Reproduction Company, Milwaukee, Wis., a corporation of Wisconsin
Application May 29, 1936, Serial No. 82,466
3 Claims. (Cl. 229—62)

1. A package, comprising, a flexible transparent bag-like container bearing indicia simulating part of an object, a rigid closure for the open end of said container simulating the remaining parts of said object, said closure having an enlarged end insertible within the container end and a continuous annular recess directly adjoining said end, and means coacting with said container and with the recess and enlarged end of said closure to secure these parts together.



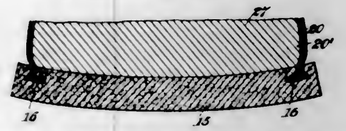
2,102,330
CONVEYING APPARATUS
Vincent K. Newcomer, Independence, Mo.
Application November 16, 1935, Serial No. 50,166
5 Claims. (Cl. 302—50)

1. In a conveying apparatus in which finely divided materials are admixed with air, an air distributing manifold, a conduit for supplying air to said manifold, a valve in said conduit, and



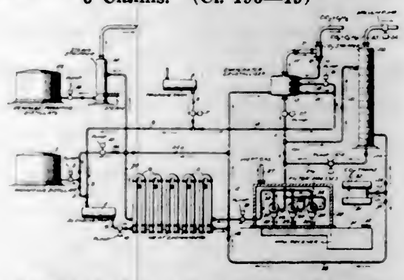
means responsive to the air pressure in said manifold for controlling said valve.

2,102,331
ICE PICK
Harry F. Niles, Covina, Calif.
Application October 14, 1935, Serial No. 44,858
4 Claims. (Cl. 83—62)



1. An ice pick including a body having a handle and having two rows of sharp prongs set therein and projecting therefrom, longitudinally thereof, one row of prongs being shorter than the other row and being set at an angle thereto, whereby said prongs, if extended lengthwise, would intersect the line of said longer prongs.

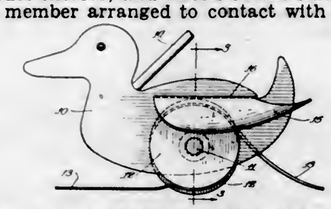
2,102,332
FIREARM
George Norman, Birmingham, England, assignor to Auto-Ordnance Corporation, New York, N. Y., a corporation of New York
Original application June 5, 1934, Serial No. 729,052. Divided and this application April 23, 1936, Serial No. 75,950
2 Claims. (Cl. 42—75)



1. A firearm comprising a receiver having a forwardly facing abutment therein and having a rear face, a frame slidably mounted under the receiver with a portion seating against said face, said portion having an opening extending therethrough from top to bottom, said frame having a recess opposite said abutment, a pivot pin extending crosswise of said recess in advance of said abutment, a catch having its forward end pivoted on said pin and having a shoulder intermediate its ends for engagement with said abutment and having its rearward end in line with said opening, and a push plunger extending through said opening for disengaging the catch from the abutment.

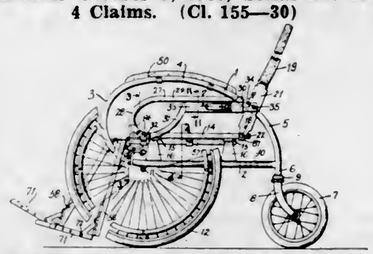
2,102,333
SHOE AND METHOD OF MAKING SAME
Edward Quinn, Brooklyn, N. Y., assignor to The Del-Mac Shoe Process Corporation, New York, N. Y.
Application December 17, 1935, Serial No. 54,798
5 Claims. (Cl. 12—142)

1. A turned shoe comprising a sole member having a channel of angular cross section extending about the surface margins inwardly of the edge thereof, a strip of angular cross section inlaid in said channel and an upper clinched between said strip and the outer wall of the channel, the inlaid sides of said strip being substantially parallel to the channel walls and the surface of the strip lying flush with said margins of the sole member.



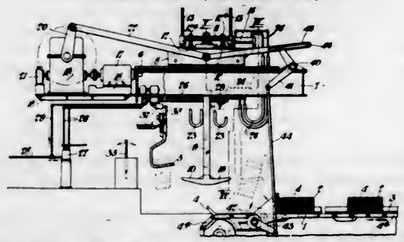
2,102,334
PROCESS FOR DEWAXING HYDROCARBON OILS
Earl Petty, Hempstead, N. Y., assignor, by mesne assignments, to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application April 14, 1933, Serial No. 666,099
6 Claims. (Cl. 196—19)

6. A method of dewaxing hydrocarbon oils including the steps of mixing oil to be dewaxed with a liquefied, normally gaseous hydrocarbon diluent, then chilling the mixture and increasing the concentration of the oil in the mixture by stripping the diluent hydrocarbon from the oil with a normally gaseous, non-inflammable material of a lower boiling range than the diluent and removing the wax from the oil.



2,102,335
TOY
James S. Richards, Cincinnati, Ohio
Application February 17, 1936, Serial No. 64,248
10 Claims. (Cl. 46—104)

1. A toy of the class described comprising a body member; movable members projecting from the sides thereof; and wheels on the sides of said body member arranged to contact with and rub



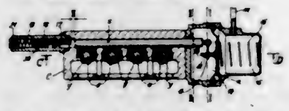
against the undersides of said movable members to impart lifelike movements thereto.

2,102,336
INVALID CHAIR
Mayo E. Roe, Elyria, Ohio, assignor to The Colson Corporation, Elyria, Ohio, a corporation of Ohio
Application October 9, 1936, Serial No. 104,863
4 Claims. (Cl. 155—30)

1. In an invalid chair, a pair of laterally spaced frame elements comprising tubes each bent to provide a lower generally horizontal forwardly and rearwardly extending portion, an upwardly bent forward portion, an upper rearwardly extending arm rest supporting portion and a rearwardly depending portion, the horizontal portion secured at its rear end to the depending portion, caster wheels on the lower ends of the depending portions, uprights on the horizontal portions, a seat on the uprights, front wheels supporting the frame at the forward portion of the horizontally extending frame elements and transverse bracing elements connecting the said frame elements.

2,102,337
APPARATUS FOR HANDLING COILS
George H. Rose, Cleveland, Ohio
Application November 24, 1936, Serial No. 112,596
4 Claims. (Cl. 214—91)

1. Coil handling apparatus including the combination of a conveyer for transporting rod bundles in the horizontal and a transfer mechanism for engaging said bundles when vertically disposed, a table for intercepting said bundles in the plane of said conveyer, means for elevating said table to a position cooperable with said



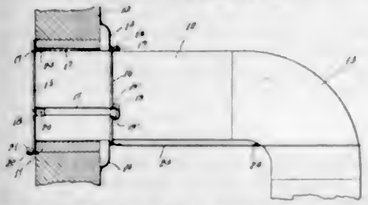
transfer mechanism, said means being coordinated in operation with that of said transfer mechanism.

2,102,338

GOVERNOR MEANS FOR LIQUID INJECTION INTERNAL COMBUSTION ENGINES

Alfred Schweizer, Stuttgart, Germany, assignor to Robert Bosch Aktiengesellschaft, Stuttgart, Germany

Application April 26, 1935, Serial No. 18,418
In Germany May 25, 1934
6 Claims. (Cl. 123—139)



1. Governor means for liquid injection internal combustion engines comprising a control member adapted to adjust the fuel delivery, a servo member subject to a variable and pulsating governing force in one direction and a return force in the opposite direction variable in accordance with the position of the servo-member thereby causing comparatively long-range desirable oscillations and undesirable short-range hunting oscillations of said servo-member and a lost motion connection between said control member and said servo member permitting the servo member to oscillate under the influence of the pulsations of said governing force without transmitting such undesirable hunting oscillations to the control member at least within the range of movement of the servo-member corresponding to the lower speed range of the engine.

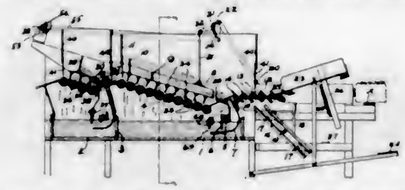
2,102,339

STOVEPIPE COLLAR AND ANCHOR

Albertus Upton, Waveland, Ind.

Application May 5, 1936, Serial No. 78,014
3 Claims. (Cl. 126—318)

1. Fastening means for a stovepipe, comprising two wire rings having offset portions, metal bands secured to said offset portions and connecting the rings, one of said rings being adapted to engage in a chimney opening, the other ring being carried by a stovepipe and engaging the outer face of the chimney.



2,102,340

REMOVING SPRAY RESIDUE AND OTHER ACCUMULATIONS FROM FRUIT AND THE LIKE

Paul Van Wyk, Portland, Oreg., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware

Application March 27, 1934, Serial No. 717,644
19 Claims. (Cl. 146—202)

1. An apparatus for treating fruit and the like to remove spray residue and other accumulations from the surfaces thereof comprising rotating transverse brush means for supporting and advancing a stream of fruit along a predetermined path, grid openings along said path, rotating means underneath said grid openings and transverse thereof for throwing a stream of treating solution upward therethrough and over the same onto fruit positioned on said supporting means,

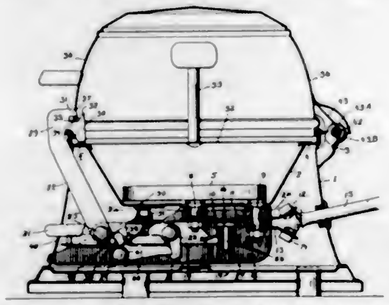
a tank of solution in which said rotary means is mounted and means for imparting rotation thereto, a housing surrounding said rotating means to segregate the body of liquid directly in contact with said rotating means from the main body of liquid in the tank.

2,102,341

PROCESS FOR REACTIVATION OF SPENT CLAY

George Hugo von Fuchs, Wood River, Ill., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Application April 15, 1936, Serial No. 74,498
8 Claims. (Cl. 252—2)



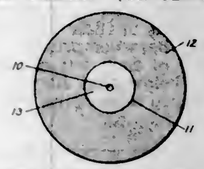
3. In the process of reactivating spent refining clay containing adsorbed organic matter, the steps of extracting same with a neutral organic solvent for said adsorbed organic matter in the presence of sufficient ammonia to displace the adsorbed matter from the clay, said solvent being volatile and substantially stable under the conditions of the extraction.

2,102,342

ELECTRICAL COOKING AND HEATING APPARATUS

Emil Walder, Rochester, N. Y., assignor to Samson-United Corporation, Rochester, N. Y.

Application June 11, 1931, Serial No. 543,637
14 Claims. (Cl. 219—43)



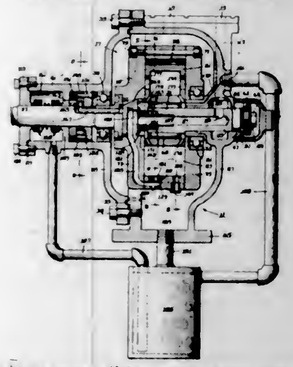
1. An electric cooking and heating apparatus comprising a vessel adapted to receive a body of vaporizable liquid, an electric heating unit mounted within said vessel so as to be completely surrounded by the vaporizable liquid in the vessel, a thermostatically operated switch mounted on said vessel so as to be operated only by the direct radiation from said heating unit after the vaporizable liquid has been vaporized thereby.

2,102,343

GRINDING WHEEL

Kenneth F. Whitcomb and Herbert W. Wagner, Worcester, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application July 3, 1933, Serial No. 678,816
13 Claims. (Cl. 51—206)



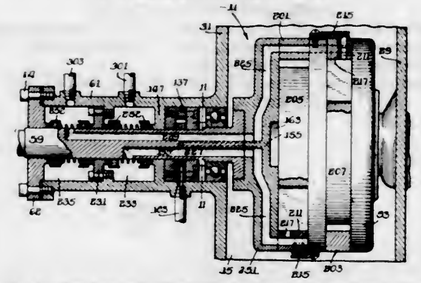
11. A grinding wheel of uniform basic structure which has an arbor hole throughout and which has an outer zone and a relatively narrow inner annular zone adjacent the arbor hole impregnated throughout the thickness of the wheel with a strengthening material, the outer annular zone being unimpregnated and unchanged.

2,102,344

COMPRESSOR

William W. Wishart, Chicago, Ill.

Application January 23, 1935, Serial No. 3,030
10 Claims. (Cl. 230—140)



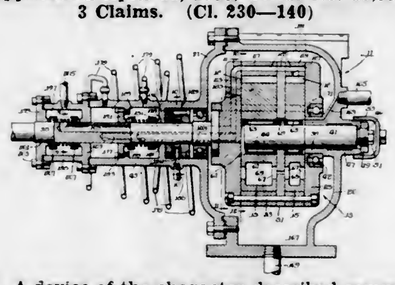
1. A rotary reversible compressor comprising a cylinder element and a piston element within the cylinder element, said piston element having an axis relatively eccentric with respect to the axis of the cylinder element, said elements defining a compression space therebetween, means to rotate the cylinder element about its axis, a blade carried by the cylinder element and having bearing engagement on the piston element, said blade being adapted to sweep through said compression space during an operating cycle of the compressor whereby to force fluid in said compression space, said cylinder element having inlet ports communicating with said compression space, one on each of the opposite sides of said blade, both of said inlet ports being provided with valve means opening toward said space, means forming a common inlet communicating with said inlet ports in advance of said valve means, said cylinder element also being formed with outlet means comprising outlet ports communicating with said compression space one on each of the opposed sides of said blade and opening outwardly of said cylinder through a wall thereof, both of said outlet ports having valve means opening outwardly of said compression space whereby the compressor may deliver a fluid work medium from the inlet through said outlet means regardless of the direction of rotation of said cylinder element.

2,102,345

COMPRESSOR

William W. Wishart, Chicago, Ill.

Application February 9, 1935, Serial No. 5,712
9 Claims. (Cl. 230—140)

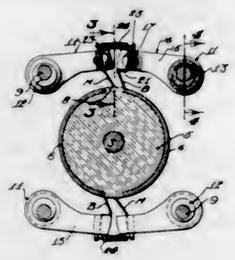


1. A device of the character described comprising cylinder means providing a plurality of pressure stages, piston means associated with each stage, said cylinder means having a projecting shaft fixed on an end wall thereof whereby the same may be supported for rotation about its axis, axially extending duct means in said shaft, blade means cooperatively associated with the cylinder means and the piston means in the several stages, said cylinder and piston means being operable to develop a pressure differential on opposite sides of the blade means in each of the stages when the cylinder means is rotated, said end wall carrying the shaft having a plurality of substantially radially extending ducts communicating each with one of the several stages and with said axially extending duct means.

2,102,346

COMPRESSOR

William W. Wishart, Chicago, Ill.

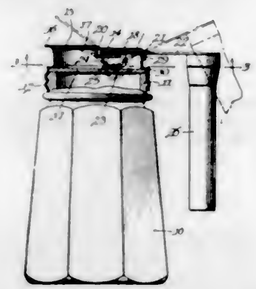


Application April 11, 1935, Serial No. 15,830
3 Claims. (Cl. 230—140)

1. A device of the character described comprising cylinder means providing a plurality of pressure stages, piston means associated with each of said stages, blade means associated with the piston and cylinder means in the several stages, said cylinder means comprising an end wall having a projecting shaft whereby the cylinder means may be supported for rotation about its axis, duct means extending axially in said shaft, said end wall having a plurality of substantially radially extending ducts connecting with said duct means, at least one of said radially extending ducts being in communication with one of said pressure stages at one side of the blade

means, and another of said radially extending ducts communicating with said stage on the opposite side of said blade means, said piston and cylinder means being operable to develop a pressure differential on opposite sides of the blade means in the several stages when the cylinder means is rotated.

2,102,347
COMMUTATOR BRUSH
James C. Arnold, Los Angeles, Calif., assignor to Lane-Wells Company, Los Angeles, Calif., a corporation of Delaware
Application June 29, 1936, Serial No. 87,965
8 Claims. (Cl. 171—323)



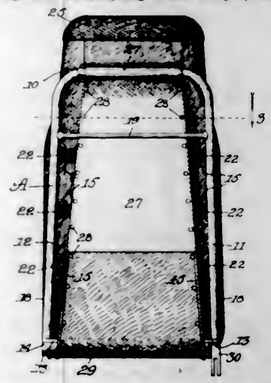
1. A commutator brush structure comprising: a pair of brush elements disposed in contiguous relation with each other and engageable with a commutator; means electrically coupling said brush elements directly one with the other so that they form in effect a single brush means; and a device for shifting said brushes to and from each other to vary the effective width of said brush means.

2,102,348
CUSPIDOR CARRIER AND HANDLER
Charlie T. Balochi, Roanoke, Va.
Application March 20, 1937, Serial No. 132,141
2 Claims. (Cl. 294—32)

1. A device of the class described comprising a cylinder provided with a pair of diametrically opposed slots adjacent its lower end, a handle bar secured to its upper end and spanning the same, a pair of leaf springs secured to the cylinder to depend therefrom in vertical alignment with said slots, respectively, a pair of block-like grips secured to the lower ends of said springs, respectively, to project through said slots into said cylinder and tensioned against separative movement by said springs, and manipulative means for separating said grips comprising a pair of bars depending from the top of said cylinder and secured at their lower ends to said grips, respectively, said bars being swingably mounted on said cylinder for separative movement of their lower ends, means for swinging said bars comprising an extension on the upper end of each bar overlying the top of said cylinder below said handle bar, and a sleeve-like hand grip telescoping over the extensions of said bars.

2,102,349
CLOSURE FOR RECEPTACLES
Charles S. Baron, Tiffin, Ohio
Application July 7, 1937, Serial No. 152,460
20 Claims. (Cl. 65—31)

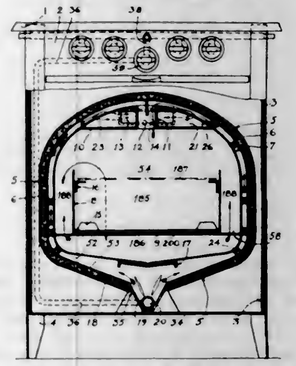
14. A cap for dispensing receptacles having a discharge opening and spaced slots in the top thereof, a flap above the top and normally positioned to close said opening, said flap having a depending offset portion extending through one of said slots and arranged loosely to engage the wall thereof to provide a fulcrum support for the flap when the same is moved relative to said opening, and means extending through the other of said slots and operatively connected to said offset portion whereby upon the actuation of said means to raise the flap relative to said opening.



2,102,350
PROCESS FOR MANUFACTURING AMINO SULPHONIC ACID
Paul Baumgarten, Berlin, Germany, assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 30, 1936, Serial No. 88,090. In Germany May 21, 1935
7 Claims. (Cl. 23—190)

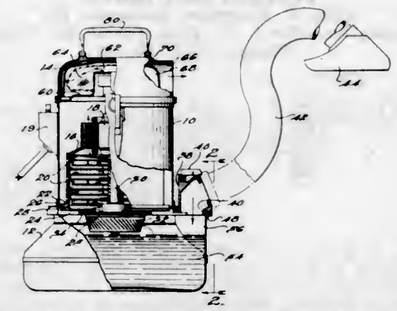
7. The process for producing amino sulphonic acid which comprises reacting urea with sulphur trioxide in the presence of sulphuric acid.

2,102,351
SEAT BACK
Ernie J. Beck and William B. Schroeder, Chicago, Ill., assignors, by mesne assignments, to S. Karpen & Bros., a corporation of Illinois
Application May 22, 1935, Serial No. 22,844
10 Claims. (Cl. 155—178)



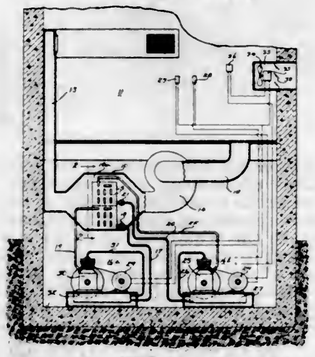
1. A seat back comprising: a substantially rectangular frame having spaced vertical bars

equipped with attachment loops, non-elastic straps hingedly engaging said loops, and an elas-



tic sheet centrally located within said frame and secured to the inner ends of said straps.

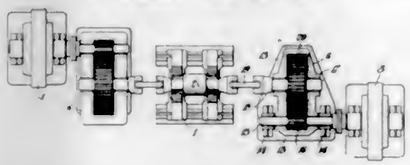
2,102,352
COOKING RANGE WITH MUFFLE-OVEN
Tord Erik Daniel Bilde, Stockholm, Sweden
Application November 16, 1933, Serial No. 698,338
In Sweden February 23, 1933
1 Claim. (Cl. 126—39)



In an oven construction arranged to give an equal heat in every part of a muffle oven, the combination of a closed shell, a muffle oven suspended within said shell in such a manner that channels for the hot flue gases are provided around the walls of the muffle oven, a heater arranged within said shell and below said muffle oven, means to evenly distribute the heating medium over the bottom and side walls and the upper side of the muffle oven and an inner food retaining compartment suspended within said muffle oven consisting of a substantially horizontal plate spaced from the bottom of the muffle oven and of such dimensions that channels are left between its edges and the bounding walls of said muffle oven, said plate being provided with two upwardly directed walls which extend throughout the depth of the oven and substantially parallel to the sides thereof to form channels for air circulating within said oven in a defined path upwardly through oppositely disposed side channels and downwardly through further oppositely disposed end passages separated from said channels by the upwardly directed walls.

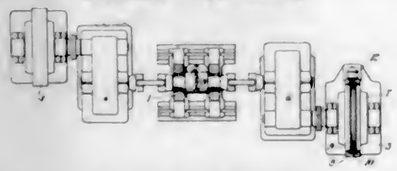
2,102,353
VACUUM CLEANER
Clarence A. Brock, Detroit, Mich., assignor to Rexair Corporation, Detroit, Mich., a corporation of Michigan
Application January 8, 1937, Serial No. 119,578
7 Claims. (Cl. 183—24)

1. In a device of the class described, a portable vacuum cleaner housing having inlet and outlet openings therethrough and including a receptacle containing a bath of liquid, said inlet opening communicating with said receptacle, a blower within said housing, a centrifugal separator extending into said receptacle above said bath, and means for operating said blower and said separator for drawing air into said housing through said inlet opening, into contact with the liquid of said bath, through said separator, and for discharging the air through said outlet opening.



2,102,354
REFRIGERATION
Jewel C. Chambers, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application May 16, 1933, Serial No. 671,314
Renewed April 20, 1937
5 Claims. (Cl. 62—6)

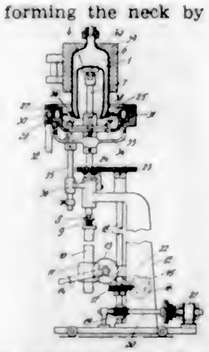
1. In an air conditioning apparatus, an enclosure, air flow means having an outside fresh air inlet and a recirculated air inlet for air to be conditioned for said enclosure, air blowing means for circulating air through said air flow means, a plurality of refrigerant evaporators in said air flow means, refrigerant liquefying means connected to said evaporators, means automatically rendering inactive the evaporation of refrigerant in one of said evaporators while evaporation remains active in another of said evaporators in accordance with conditions in said enclosure and



balancing the liquefying capacity of said liquefying means, whereby the active refrigerant temperature remains substantially constant.

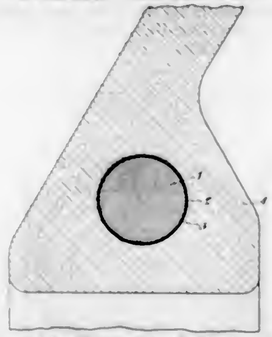
2,102,355
ROLLING MILL DRIVE
Alden C. Cummins, Duquesne, Pa.
Application March 21, 1934, Serial No. 716,686
2 Claims. (Cl. 80—54)

1. A drive for a rolling mill having a frame adapted to horizontally mount rolls at different axial levels, said drive including the combination of a pinion fixedly journaled in spaced relation to the ends of rolls mounted by said frame, a gear journaled by means constantly holding it in mesh with said pinion while permitting it to swing to different levels and a vibrating spindle for interconnecting said gear and the ends of rolls mounted by said frame, whereby power from a stationary power source may be transmitted to rolls mounted by said frame through said spindle and the latter maintained at efficient operating angles regardless of differences in the axial levels of said rolls by swinging said gear to the levels required, said spindle moving universally to accommodate swinging of said gear.



2,102,356
DIE-ROLLING MILL
Alden C. Cummins, Duquesne, Pa.
Application March 21, 1934, Serial No. 716,687
4 Claims. (Cl. 80—24)

1. A die-rolling mill including the combination of a frame, cooperative rolls journaled in said frame, said rolls being individually provided with cooperative recesses or matrices which are shaped according to the requirements of the work being rolled, a synchronous electric motor arranged to drive one of said rolls, a second synchronous electric motor arranged to drive the other of said rolls and means for rotatively mounting at least the stator windings of at least one of said motors so as to thereby effect angular adjustments of said rolls.

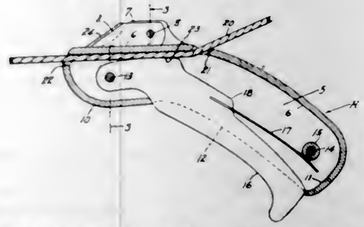


2,102,357
METHOD AND APPARATUS FOR MAKING DOUBLE-WALLED GLASS VESSELS
Jakob Dichter, Berlin-Schoneberg, Germany
Application April 20, 1934, Serial No. 721,464
In Germany March 4, 1933
11 Claims. (Cl. 49—7)

1. In the manufacture of double-walled, substantially bottle-shaped glass vessels in one piece the step of forming the neck by exerting cen-

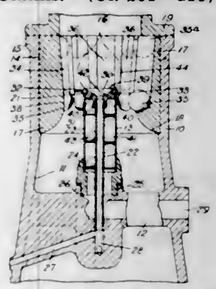
trally directed pneumatic pressure on the neck portion of the inner wall.

2,102,358
TIRE WIRE
Flint C. Elder, Cleveland, Ohio, assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application November 18, 1935, Serial No. 50,469
3 Claims. (Cl. 245—1.5)



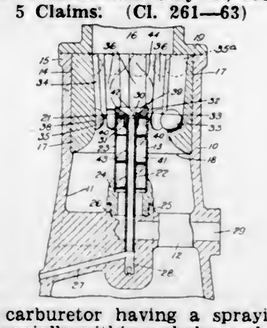
1. The combination of a steel object having a galvanized coating and bearing at least traces of silver on the outer surface of said coating, and a rubber body vulcanized to said steel object, whereby said object is protected from corrosion by said coating and firm adherence with said rubber body is secured by said silver.

2,102,359
SANITARY GARMENT
Jacob G. Frieman, Attica, Ohio
Application November 5, 1935, Serial No. 48,404
7 Claims. (Cl. 128—289)



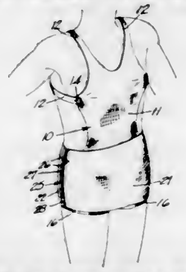
4. A sanitary garment of the class described comprising a fabric body member having a closed crotch portion formed with a central pad receiving pocket attached to the crotch portion by a fulling reinforcing seam, said pocket being formed with a longitudinal opening for the removal of a pad from said pocket through said opening.

2,102,360
TWINE CONTROLLING AND CUTTING DEVICE
Harvey Geroux, Los Angeles, Calif.
Application September 3, 1935, Serial No. 38,901
2 Claims. (Cl. 30—127)



1. In a device of the kind described, a casing having a knife mounted externally thereon and a cord guide leading therethrough, and furnished with a handle portion whereby said casing is manually bodily movable to sever said cord, and means within said casing to grip the portion of the cord within the casing between said means and said casing, said cord gripping means comprising a pivoted lever operable by the fingers of a hand which is gripping said handle portion, the cord-gripping portion of said lever being near its pivot and the portion thereof engageable by the fingers of the operator being remote therefrom, there being an opening for the cord through the wall of the casing adjacent to said knife in order that the cord may be directed backwardly from said opening and then severed by said knife while said cord is held under tension by said cord-gripping means.

2,102,361
CARBURETOR
Arthur William David Gladwell, London, England
Application February 7, 1936, Serial No. 62,852
In Great Britain July 18, 1935
4 Claims. (Cl. 261—116)

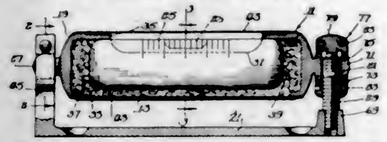


1. In a carburetor having a spraying nozzle mounted coaxially within a choke, said nozzle comprising two concentric tubes, means for admitting fuel and atmospheric air respectively to the inner one of said tubes and to the annular space between said tubes, and a centrally perforated cap upon the upper ends of said tubes, a rim around said cap, said rim located above the narrowest portion of said choke and projecting radially beyond the outer one of said tubes, the upper surface of said cap including a depression around the central perforation and a plurality of oblique holes spaced around said central perforation, said holes communicating with said annular space below said cap and converging upon the axis of said central perforation at a point within said depression.

2,102,362
CARBURETOR
Arthur William David Gladwell, London, England
Application February 7, 1936, Serial No. 62,853
In Great Britain July 18, 1935
5 Claims. (Cl. 261—63)

1. In a carburetor having a spraying nozzle mounted coaxially within a choke, a choke member having a convergent inlet portion and a divergent outlet portion, said outlet portion having its inner surface formed with flutings extending approximately from the throat of said choke member to the end of said outlet portion, said flutings being open for their entire length inwards of said surface, and elements loosely confined in said flutings, said elements partly projecting from the open sides of said flutings to restrict the passage through said outlet portion and being controlled by the air current through said choke.

2,102,363
BATHING SUIT
Theodore R. Kugler, Inglewood, Calif.
Application August 22, 1932, Serial No. 629,857
Renewed April 15, 1935
8 Claims. (Cl. 2—67)



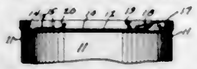
1. In an article of swimming apparel, the combination of: a front body covering; a plurality of straps secured to said front covering, said straps being adapted to embrace the wearer's body; means for removably securing the free ends of said straps to said front covering; hip covering flaps formed on said front covering; a breech covering; a crotch member joining said breech covering with a lower portion of said front covering; and means for attaching or detaching said breech covering to or from said hip covering flaps.

2,102,364

SPIRIT LEVEL AND MEANS FOR MOUNTING SAME

Adolph Langsner, Chicago, Ill., assignor to Eugene Dietzgen Company, Chicago, Ill., a corporation of Delaware

Application December 23, 1935, Serial No. 55,767
9 Claims. (Cl. 33—214)



1. A spirit level comprising an elongated element, a support, cooperating means formed on said support and on one end of said element for swivelingly mounting said end on the support, said element having a mounting portion remote from said end and formed with an opening therethrough, said mounting portion having oppositely-facing, spherical surfaces formed thereon at the opposed ends of said opening, a threaded post carried by said support in position to extend through said opening, a threaded nut adjustable on said post and carrying a spherical portion for engagement with the spherical surface on one side of the mounting portion whereby to support the same adjustably on the post to determine the angularity of said element with respect to the support, and clamping means having a threaded portion engaging said post and a spherical portion adapted to engage the spherical surface on the opposite side of said mounting portion for clamping said portion in adjusted position between said nut and said clamping element.

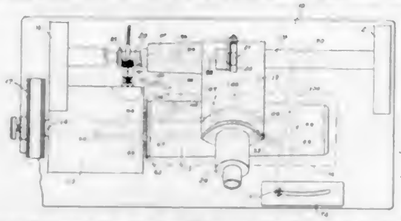
2,102,365

CAN OPENING DEVICE

Harold B. Lloyd, Sioux City, Iowa

Application January 8, 1934, Serial No. 705,708
2 Claims. (Cl. 220—48)

1. A can opening device comprising a flat shearing member positioned to lie against the upper can top, and including a piercing point at the extremity thereof, shearing surfaces tapering downwardly from said point, means for attaching the shearing member to the can, said shearing surfaces having an opening therebetween to allow pouring of a liquid therethrough.



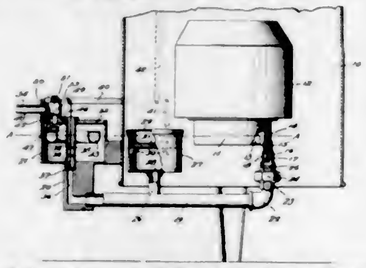
2,102,366

DICTATING MACHINE

Joseph M. Lucarelle and John E. Renholdt, Bridgeport, Conn., assignors to Dictaphone Corporation, New York, N. Y., a corporation of New York

Original application June 7, 1929, Serial No. 369,044. Divided and this application November 2, 1933, Serial No. 696,364. Renewed January 9, 1936
4 Claims. (Cl. 274—17)

3. In a dictating machine, in combination, a record-support, a carriage, a sound-box supported by said carriage, a sound-box control having recording, neutral and reproducing positions, a record-ejector, means for preventing operation of said record-ejector, means rockable in any position of the carriage for controlling operation of said preventing means, and means pivotally connected to said sound-box control for so controlling movement of said rockable means as to



permit operation of said record-ejector when said sound-box control is moved to neutral position.

2,102,367

BURNER AND FUEL CONTROL MECHANISM

David Lumsden, Sikeston, Mo.

Original application December 21, 1935, Serial No. 55,644. Divided and this application December 22, 1936, Serial No. 117,195
6 Claims. (Cl. 158—84)

2. A burner comprising a fuel pan having a fuel inlet at its bottom, a fuel chamber spaced laterally from said fuel pan and having an upper portion above the plane of the bottom of the fuel pan, said chamber having a fuel inlet, a fuel pipe leading from said fuel chamber to the fuel inlet of said fuel pan, an auxiliary fuel chamber above the fuel pipe extending upwardly above the plane of the bottom of the fuel pan and having an outlet at its bottom communicating with the fuel pipe, float controlled means for controlling flow of fuel into the fuel chamber, a valve for controlling flow of fuel from the fuel chamber through the fuel pipe, and a removable body in the auxiliary fuel chamber for displacing a predetermined quantity of fuel above the plane of the bottom of the fuel pan.

2,102,368

ARCH-SUPPORTING STOCKING

Edgar J. Martel, Laconia, N. H.

Application September 26, 1935, Serial No. 42,251
5 Claims. (Cl. 66—182)

1. A knitted sock or stocking having its leg portion made of an inelastic yarn and having an elastic yarn knitted into the sole portion thereof

together with an inelastic yarn continuously from the heel pocket to the toe pocket thereof, whereby the arch of the foot is given support and a substantial cushion is provided for the ball of the foot.

2,102,369

GARTER STOCKING

Edgar J. Martel, Laconia, N. H.

Application March 3, 1936, Serial No. 66,826
2 Claims. (Cl. 66—172)

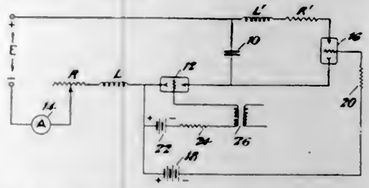
1. In an article of hosiery, supporting means incorporated therein comprising an elastic area in the leg portion thereof extending around approximately the rear half only of the circumference, said elastic area containing knitted elastic yarn.

2,102,370

FLOTATION PROCESS

Marion H. Merriss, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 16, 1935, Serial No. 11,438
17 Claims. (Cl. 209—166)



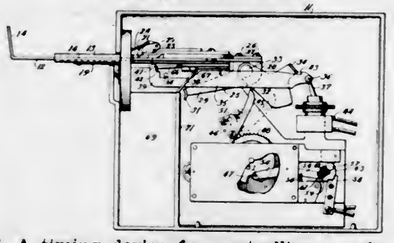
1. In the froth flotation process of treating ores, the step which comprises utilizing as a flotation agent a sulfuric acid derivative of a mixture of the oxygenated organic compounds boiling above 100° C. obtained from the catalytic hydrogenation of carbon oxides under elevated temperatures and pressures.

2,102,371

IMPULSE RATE METER

Benjamin Miller, Richmond Hill, N. Y., assignor to Power Patents Company, Jersey City, N. J., a corporation of Maine

Application June 4, 1936, Serial No. 83,447
3 Claims. (Cl. 175—368)



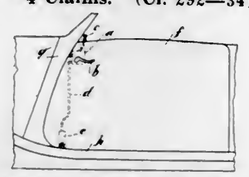
1. In an electric impulse rate meter, a condenser, a source of energy for charging the condenser, means connected in series circuit with the energy source and with the condenser for charging the condenser to a potential higher than the potential of the energy source, said means comprising a normally non-conducting trigger tube and an inductance forming with the condenser an oscillating circuit, automatic means for discharging the condenser as soon as it reaches its maximum potential, and means for applying the impulses whose rate is to be measured to the trigger tube thereby rendering said trigger tube conductive.

2,102,372

TIMING DEVICE FOR ELECTRICALLY CONTROLLED APPARATUS

Bert E. Mills, Oak Park, Ill., assignor to Mills Novelty Company, Chicago, Ill., a corporation of Illinois

Application June 30, 1933, Serial No. 678,405
3 Claims. (Cl. 194—9)

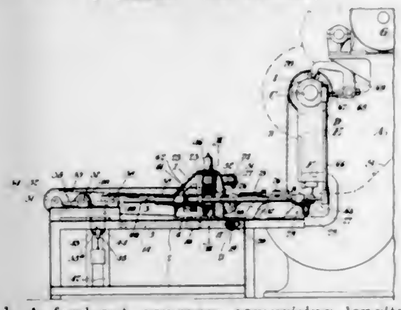


3. A timing device for controlling an electric circuit comprising a coin slide having an advancing stroke in a stranght line and a return stroke, two switches in the circuit to be controlled, a member connected with one of said switches, means carried by the slide adapted to operatively engage said member after predetermined advancing movement of the slide and, upon further movement, to cause said member to open said switch, means operable by said slide for closing the other switch on such advancing stroke, said member being operable through the instrumentality of said slide upon its return stroke for closing said first-mentioned switch, and timing mechanism adapted to be set by operation of said slide, said mechanism being operatively connected to said second-mentioned switch and adapted to open the same after a predetermined time.

2,102,373

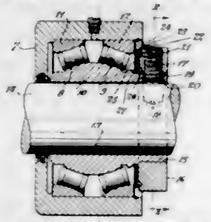
LATCHING SYSTEM FOR AUTOMOBILES OR OTHER VEHICLES

Lucien Dominique Octave Moittié, Levallois-Perret, France, assignor to Société Anonyme des Etablissements Repusseau & Cie, Levallois-Perret, France, a company of France



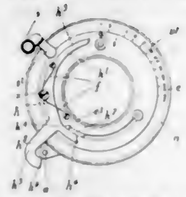
Application December 20, 1935, Serial No. 55,478
In France January 5, 1935
4 Claims. (Cl. 292—34)

1. In a vehicle including a bodywork, at least one door, and a door frame carried by said bodywork, a latching system which comprises, in combination, two corresponding rigid metallic pieces adapted to wedge in each other carried by said door and a vertical side of said frame, respectively, so as to engage each other when said door is closed, means for positively interlocking said pieces in each other, two other corresponding rigid metallic pieces adapted to wedge in each other carried by said door and the lower horizontal side of said frame, respectively, so as to engage each other when said door is closed,



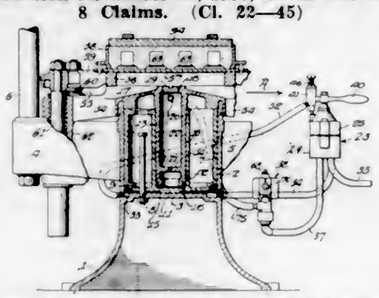
means for positively interlocking the two last mentioned pieces in each other, and means interposed between said interlocking means for causing them to operate simultaneously.

2,102,374
CONVEYER
Carl E. Moore, Gary, Ind., assignor to American Sheet & Tin Plate Company, a corporation of New Jersey
Original application January 23, 1934, Serial No. 707,979. Patent 2,025,418, dated December 24, 1935. Divided and this application November 27, 1935, Serial No. 51,908
3 Claims. (Cl. 271—80)



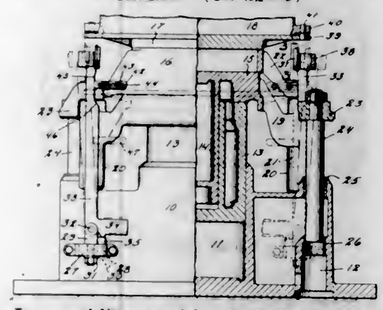
1. A feed-out conveyer comprising longitudinally extending guide means, a cross-head mounted for sliding movement longitudinally relative to said guide means, means for moving said cross-head, a roller journaled on said cross-head, a second roller journaled on a fixed portion of said conveyer remote from said cross-head, an endless belt conveying element trained around said rollers and provided with a take-up loop, and a counterweighted roller mounted in said take-up loop.

2,102,375
FASTENING MEANS FOR BEARING SLEEVES
Frederick C. Morton, Eggertsville, N. Y.
Application February 26, 1937, Serial No. 127,951
12 Claims. (Cl. 308—236)



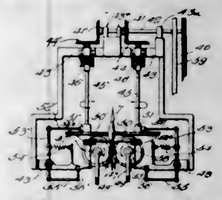
1. A bearing of the character described including a sleeve-like member which is adapted to fit upon the shaft with which the bearing is associated, said member having a hub portion, the outer face of which is eccentric to the bore of said member, said hub portion having an elongated circumferentially arranged slot formed therein, a collar which is mounted upon said hub portion and means carried by said collar which extends through said slot to engage said shaft, said means being adjustable to cause the opposite sides of said collar and shaft to engage the thin side of said hub portion, whereby said member is prevented from moving relatively to said shaft by the wedging of said hub portion between adjacent portions of said collar and shaft.

2,102,376
SHUTTER TRIGGER LATCH
August Nagel, Stuttgart, Germany, assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application October 2, 1936, Serial No. 103,702
In Germany October 4, 1935
7 Claims. (Cl. 95—62)



1. A locking mechanism for photographic shutters comprising, in combination, a trigger, a shutter tensioning member, a shutter setting member movable to different positions for determining the type of exposure, including instantaneous, time and bulb, an armed lever pivotally mounted on the shutter, a trigger latch carried by an arm of the lever, and means carried by the shutter setting mechanism adapted to engage and move said lever to release the trigger latch when said shutter setting member is moved to time or bulb position.

2,102,377
JOLTING AND SQUEEZE CONTROL FOR MOLDING MACHINES
William H. Nicholls, Roslyn, and Gustave Anderson, Brooklyn, N. Y.; William H. Nicholls, Roslyn, N. Y., administrator of said William H. Nicholls, deceased; assignors to Wm. H. Nicholls Co., Inc., Richmond Hill, N. Y., a corporation of New York
Application November 22, 1935, Serial No. 51,144
8 Claims. (Cl. 22—45)

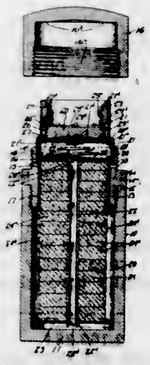


1. In a molding machine, the combination of a squeeze cylinder and a piston operating therein, a jolting cylinder, a jolting plunger operating within the jolting cylinder, and supporting means for a flask to be jolted by said jolting plunger and subsequently pressed by said squeeze piston, a manually operable control valve for selectively supplying fluid pressure to the jolting plunger or to the squeeze cylinder and for subsequently exhausting fluid pressure from the latter, means for preventing operation of the valve to exhaust fluid pressure from the squeeze cylinder until the pressure therein has reached the maximum, and a normally open and retardedly closed automatic fluid pressure operated valve remote and separate from the manual valve interposed between the connection from the manual valve to said jolting cylinder for controlling the number of jolts given said jolt cylinder.

2,102,378
ROLL-OFF MOLDING MACHINE
William Henry Nicholls, Roslyn, N. Y.; William H. Nicholls, administrator of William H. Nicholls, deceased, assignor to Wm. H. Nicholls Co., Inc., Long Island, N. Y., a corporation of New York
Application February 5, 1936, Serial No. 62,523
7 Claims. (Cl. 22—9)

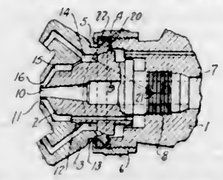
1. In a molding machine including a base carrying a squeeze cylinder, a squeeze piston slidable within said cylinder and formed with a jolt cylinder, a jolt piston slidable within said jolt cylinder and carrying a jolt and squeeze head, a top frame supported by said squeeze head, laterally positioned guiding means for said frame, a pattern plate connected to said frame and normally adapted to engage and support a flask, roll-off mechanism for said flask comprising a pair of roll bars adapted to underlie adjacent portions of said flask, arms for pivotally and adjustably supporting said bars, and adjustable means carried by said frame for maintaining said roll bars out of the path of movement of the said flask during a portion of the downward movement of said frame.

2,102,379
BEET-TOPPING MACHINE
James G. Nutter, Round Grove Township, McLeod County, Minn.
Application March 21, 1932, Serial No. 600,326
6 Claims. (Cl. 55—107)



1. In vegetable topping machines the combination of a pair of rotatable cylinders disposed axially parallel to each other, means for feeding vegetables to be topped upon said cylinders, means for rotating at least one of said cylinders whereby the tops of said vegetables are drawn between said cylinders, means for passing said vegetables toward one end of said cylinders, a knife for severing the tops of said vegetables therefrom and means for adjusting the position of said knife in accordance with the shape of said vegetable, said last means including a pair of shafts at least one of which is pivotally mounted, and means mounted on said shafts for engaging the vegetables and moving said pivoted shaft according to the size of the vegetables engaged.

2,102,380
PROCESS OF CRYSTALLIZING PURE D-GLUCONO-DELTA-LACTONE
Richard Pasternack, Brooklyn, N. Y., assignor to Charles Pfizer & Company, Brooklyn, N. Y., a corporation of New Jersey
No Drawing. Application March 23, 1934, Serial No. 717,112
9 Claims. (Cl. 260—123)



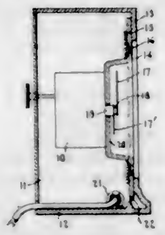
1. Process of preparing pure d-glucono-delta-lactone from aqueous gluconic acid solutions resulting from the gluconic acid fermentation of glucose, comprising over-saturating the solution in the presence within the solution of a minor proportion of an acid stronger than gluconic acid, and crystallizing d-glucono-delta lactone at 30–70° C. from the acidified solution.

2,102,381
LIGHTER CONSTRUCTION
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application January 20, 1936, Serial No. 59,822
12 Claims. (Cl. 67—7)

10. In a catalytic lighter, a container adapted to receive a volatile fuel and having a fuel vapor flow passage, a chamber adjacent said container in communication with said flow passage, a catalyst element in said chamber, said catalyst element being sealed on the bottom and sides and open at the top, and a flow conduit associated with said chamber for directing fuel vapor from said chamber to the upper open surface of said catalyst element.

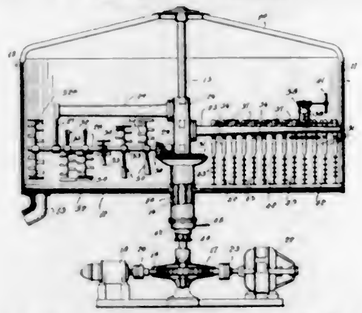
2,102,382
SPRAY HEAD
Harold A. Roselund, Toledo, Ohio, assignor to The De Vilbiss Company, Toledo, Ohio, a corporation of Ohio
Application January 16, 1936, Serial No. 59,433
6 Claims. (Cl. 299—140.1)

1. A spray gun having a body, an inner nozzle fixed to the body, an outer nozzle mounted on



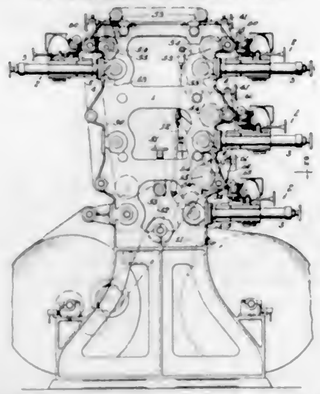
the inner nozzle, said nozzles having concentric discharge orifices and having conical portions rearwardly of said orifices one seating on the other, said outer nozzle having an outwardly projecting annular flange at its rear end with the forward face of such flange curved about a rearwardly disposed center on the common longitudinal axes of the nozzles, a union nut threaded on the body, and a ring interposed between said flange and nut in contact with the curved surface of said flange for floating movements relative thereto transverse to its axis.

2,102,383
CONNECTING DEVICE
Selden Bradley Sanford, Yonkers, N. Y., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application May 8, 1936, Serial No. 78,538
10 Claims. (Cl. 173—332)



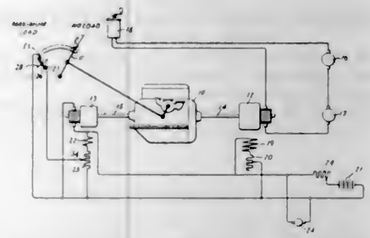
2. A connector for electrical conductors comprising, an insulated supporting body having an aperture therein, a socket having a body portion and a plurality of metallic spring fingers extending longitudinally from said body portion and positioned within said aperture, and a metallic plug for insertion into said socket, the longitudinal center portions of said fingers being out of contact with the wall of said aperture when said plug is out of said socket, said plug, when it is inserted, engaging the longitudinal center portions of the fingers and, with the edges of the fingers bearing against the wall of said aperture, flexing the fingers transversely outwardly toward said wall substantially throughout their length.

2,102,384
ILLUMINATED MEASURING DEVICE
Francis H. Scantlebury, Brooklyn, N. Y.
Original application March 10, 1932, Serial No. 598,004. Divided and this application July 18, 1935, Serial No. 32,068
9 Claims. (Cl. 240—2.1)



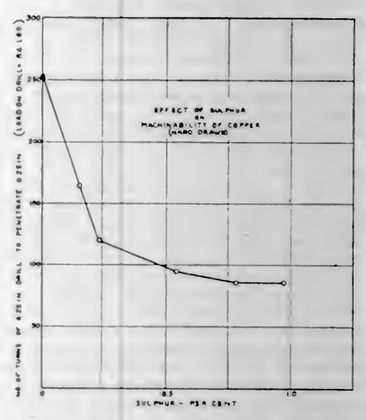
1. An illuminated device, comprising a dished member of glass with flange, the flange having etched configurations with opaque backing and the bottom of the dished member being etched to afford a background and being perforated to pass therethrough a driving element, an element movable by said driving element before the background and in juxtaposition to the configurations and contrasting with said background, and means invisible from the front of the device to illuminate the background and to edge-illuminate the configurations.

2,102,385
BREWING DEVICE
Robert C. Schock, New Rochelle, N. Y., assignor to Shock, Gusmer & Co. Inc., Hoboken, N. J., a corporation of New Jersey
Application April 20, 1936, Serial No. 75,333
5 Claims. (Cl. 259—102)



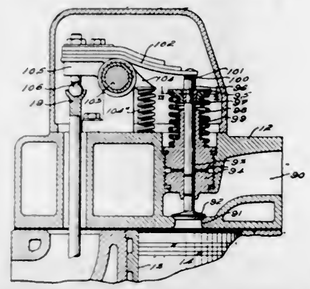
1. A mash treating means comprising a tub, a plurality of mash mixing members in the tub, means for supporting said mixing members for swinging movement about the tub, means for rotating said mixing members coactive with the swinging movement thereof, a plurality of mash loosening members, means for supporting said loosening members for swinging movement with said mixing members, the innermost of said mixing members being so constructed as to move the mash outwardly of the center of the tub at a faster rate than the outermost mixing members, and means operable exteriorly of the tub for raising said mixing members and said loosening members out of the mash within the tub.

2,102,386
PATTERN REGISTRATION MEANS FOR MULTIPLE CYLINDER PRINTING MACHINES
Harry A. Scott, North Plainfield, and Lynn B. Case, New Brunswick, N. J., assignors to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey
Application June 9, 1936, Serial No. 84,278
10 Claims. (Cl. 101—248)



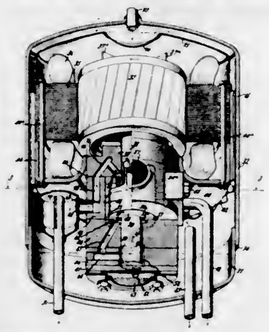
8. In a printing machine, a frame, a plurality of printing rolls for successive engagement by a web, an inking and a fountain roll associated with each printing roll, means for adjusting each printing roll with respect to its associated inking roll, means for adjusting each printing roll axially, a sprocket in driving relation to each printing roll, a chain engaging said sprockets, a pivoted arm supporting each sprocket, and means for swinging each arm to move the sprocket carried thereby lengthwise of said chain to effect registration of the patterns produced on the web by said printing rollers.

2,102,387
ELECTRIC POWER SYSTEM
George H. Shapter, Erie, Pa., assignor to General Electric Company, a corporation of New York
Application April 16, 1937, Serial No. 137,253
8 Claims. (Cl. 290—17)



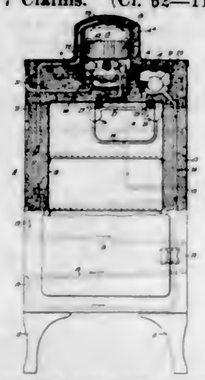
1. A power system including a prime mover providing a source of power supply, a source of electrical power supply, a main electrical load, an auxiliary electrical load, means for supplying power to said electrical loads from said prime mover, means responsive to a predetermined operating condition of said system for removing said auxiliary load from said prime mover, and means for connecting said auxiliary load across said source of electrical power supply.

2,102,388
COPPER-SULPHUR ALLOY
Cyril Stanley Smith, Cheshire, Conn., assignor to The American Brass Company, Waterbury, Conn., a corporation of Connecticut
Application September 21, 1933, Serial No. 690,345
8 Claims. (Cl. 75—160)



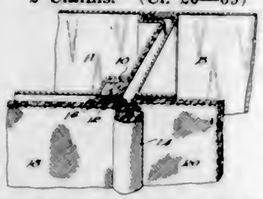
3. An article of manufacture for use in machining operations formed of a copper base alloy composed of silicon in appreciable amount up to 5%, sulphur from 0.05% to 1.5% and balance copper.

2,102,389
VALVE MECHANISM
Allen C. Staley, Birmingham, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Original application July 28, 1932, Serial No. 625,449, now Patent No. 2,011,780, dated August 20, 1935. Divided and this application March 30, 1935, Serial No. 13,823
4 Claims. (Cl. 121—127)



1. In an air motor having a cylinder provided with a movable piston; valve mechanism including an intake and an exhaust valve, each adapted to be opened and closed, said intake valve being adapted to be opened by a combined mechanical and fluid pressure differential on opposite sides thereof and to be closed by positive mechanical means.

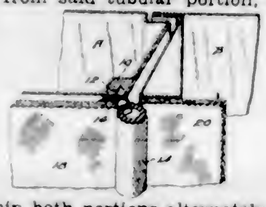
2,102,390
REFRIGERATING MACHINE
Christian Steenstrup, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application June 14, 1934, Serial No. 730,589
10 Claims. (Cl. 230—139)



4. A refrigerating machine including a closed casing, a motor and a compressor arranged within said casing, an inverted shell having a closed depression in the top thereof secured above said motor, means including a corrugated baffle sheet for providing passages for cooling fluid between said motor and said casing, and means producing a flow of cooling fluid into the depression in said shell over said shell and through the passages formed by said corrugated sheet for cooling said motor.

2,102,391
REFRIGERATING MACHINE
Christian Steenstrup, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Original application June 14, 1934, Serial No. 730,589. Divided and this application April 13, 1935, Serial No. 16,161
7 Claims. (Cl. 62—116)

1. A refrigerating machine comprising a closed casing and including an electric driving motor, means in said casing for producing circulation of refrigerant, a cabinet for said machine including a metal outer shell and an inner liner spaced therefrom and insulation filling the space therebetween, said inner liner forming a compartment having a door opening affording access thereto, said casing being imbedded in the insulation between the top wall of said metal outer shell and the top wall of said inner liner, and means including said refrigerant circulating means for cooling said compartment.



2,102,392
WEATHER STRIP
Clark A. Tea, Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application March 27, 1936, Serial No. 71,125
2 Claims. (Cl. 20—69)
